# KEY TO THE TEXT

The examples of different types of *Psychological Abstracts* records presented here are number coded to provide definition of their elements.

## JOURNAL ARTICLE ABSTRACT

'8327. 'Howard, R. Lee.; Glendenning, Robert L. & Meyer, Donald R. ' (Ohio State U) 'Motivational control of retrograde amnesia: Further explorations and effects.' *Journal of Comparative & Physiological Psychology*, 1974(Feb). Vol. 86(2), 187-192.-' Reports 5 investigations of variables related to the motivational control of retrograde amnesias for long-term habits, which result from single electroconvulsive shock treatments. Ss were 176 Long-Evans rats. In terms of the paradigms of M.J. Robbins and D.R. Meyer' (see PA Vol 44:11961), habits that were 3rd in a series were generally resistant to the treatment and were markedly impaired if the tests for retention were carried out in changed motivational contexts. The latter result is discussed in relation to the view that long-term habits are affected by the treatments if and only if, they operate as punishments. (2) ' (15 ref) -' *Journal abstract*.

- 1 - Record number.
- 2 - Author(s) or editor(s). As many as four are listed; if there are more than four, the first is listed followed by "et al." Succession marks (i.e., Jr, II, III, etc) are not given.
- 3 - Affiliation of first-named author/editor only.
- 4 - Article title, including subtitles: If the original article is in a foreign language, the translated title is given in brackets and the language of the original article is indicated in parentheses.
- 5 - Primary publication title and bibliographic data.
- 6 - Text of abstract.
- 7 - Reference to a previous entry in *Psychological Abstracts*. If an abstract number is unavailable at time of publication, the issue number is given. Consult the Author Index of the PA issue noted in order to determine the record number for the article.
- 8 - Summaries included in the primary publication are listed when in language(s) other than that of the article.
- 9 - Number of references is included when there are 15 or more listed.
- 10 - Abstract source.

## BOOK ANNOTATION

'8328. 'Chase, William G. ' (Ed). ' (Carnegie-Mellon U) 'Visual information processing. 'New York, N.Y. 'Academic, '1973. 'xiv. '555 p. '\$17.50.-' Presents a series of readings on visual processes in cognition and linguistic comprehension and on information-processing models

- 1 - Record number.
- 2 - Author(s) or editor(s). As many as four are listed; if there are more than four, the first is listed followed by "et al." Succession marks (i.e., Jr, II, III, etc) are not given.
- 3 - Designation of editor.
- 4 - Affiliation of first named author/editor only.
- 5 - Book title: If the book is in a foreign language, the original title is given followed by a translated title and the language of the book is indicated in parentheses.
- 6 - Place of publication.
- 7 - Publisher.
- 8 - Year of publication.
- 9 - Prepagination.
- 10 - Total pagination.
- 11 - Price.
- 12 - Text of annotation.

## BOOK CHAPTER CITATION

'8329. 'Clark, Herbert H.; Carpenter, Patricia A. & Just, Marcel A. ' (Stanford U) 'On the meeting of semantics and perception. 'In W.G. Chase (Ed), *Visual information processing*, New York, N.Y.: Academic, 1973. xiv, 555 p. \$17.50

- 1 - Record number.
- 2 - Author(s) of cited chapter. As many as four are listed, if there are more than four, the first is listed followed by "et al." Succession marks (i.e., Jr, II, III, etc) are not given.
- 3 - Affiliation of first-named author only.
- 4 - Chapter title.
- 5 - Referral to the whole book and its bibliographic data.

## CONTENT CLASSIFICATION

PA has subsections for some of the 17 major classification categories. These are displayed in the Table of Contents and are designed to group all abstracts relevant to a narrower topic than the major categories under a single heading. Abstracts that are relevant to a major category but not to any of the subsections are listed first and followed by abstracts that are relevant both to a major category and also to the subsections. It is expected that this will help readers locate material related to their interests more quickly.

## ABBREVIATIONS

In addition to commonly understood abbreviations\* (including all units of measurement, educational degrees, standard statistical abbreviations, and standard Latin and reference terms), standard abbreviations used in *Psychological Abstracts* records are:

ACTH = adrenocorticotrophic hormone  
DNA = deoxyribonucleic acid  
E = experimenter  
EEG = electroencephalogram or -graph  
ESP = extrasensory perception  
Exp = experiment  
IQ = intelligence quotient  
LSD = lysergic acid diethylamide  
MMPI = Minnesota Multiphasic Personality Inventory

NREM = nonrapid eye movement  
REM = rapid eye movement  
RNA = ribonucleic acid  
S = subject  
TV = television  
US = United States  
USSR = Union of Soviet Socialist Republics  
WAIS = Wechsler Adult Intelligence Scale  
WISC = Wechsler Intelligence Scale for Children

Computer languages and computer names will also be used without definition, e.g., ALGOL, COBOL, FORTRAN, IBM 360.

Language abbreviations used after translated titles are:

Afr = Afrikaners  
Alba = Albanian  
Arab = Arabic  
Bulg = Bulgarian  
Chin = Chinese  
Czec = Czech  
Dan = Danish  
Duth = Dutch  
Finn = Finnish  
Flem = Flemish  
Fren = French

Geor = Georgian  
Germ = German  
Grek = Greek  
Hebr = Hebrew  
Hung = Hungarian  
Iran = Iranian  
Ital = Italian  
Japn = Japanese  
Lith = Lithuanian  
Norg = Norwegian  
Polh = Polish

Port = Portuguese  
Romn = Romanian  
Russ = Russian  
Slov = Slovene  
Slov = Slovak  
Span = Spanish  
Srb = Serbo-Croatian  
Swed = Swedish  
Turk = Turkish  
Ukrn = Ukrainian  
Yugo = Yugoslavian

# PSYCHOLOGICAL ABSTRACTS

Volume 53

February 1975

Number 2

## GENERAL

2102. Aiba, Hitoshi F. (Keio U, Medical School, Tokyo, Japan) **Psychiatry in Japan.** *Journal of the American Institute of Hypnosis*, 1973(May), Vol 14(3), 126-131.—Traces the development of psychiatry in Japan, from a 19-century anecdote to a discussion of present day practices. Examples of various contradictions (particularly traditional vs modern values) which exist in the society and which make it difficult to practice the science are presented.

2103. Bach-y-Rita, George. (U California, Medical School, San Francisco) **The prisoner as an experimental subject.** *JAMA: Journal of the American Medical Association*, 1974(Jul), Vol 229(1), 45-46.—Discusses the effects of prison and imprisonment on a prisoner's capacity to enter into a research contract, and presents suggestions for criteria that will permit experimentation in prisons. Informed consent in prison is a particularly sensitive issue, since what may be perceived as an acceptable risk for a person inside a prison may be totally unacceptable for that same person outside. The inability of the prisoner to have access to a physician of his choice and the lack of protection that prison affords to the prisoner also must be considered. The types of coercive pressure that occur in prison and how they operate to influence participation (e.g., prisoners may be attracted to the relatively comfortable life that a research ward offers) also place restraints on experimental studies in prison environments. The need for all investigators to design research compatible with social and ethical principles is emphasized.—L. Gorsey.

2104. Benjamin, Martin. (Michigan State U) **Vesey on volition: The "second mistake."** *Michigan Academician*, 1974(Spring), Vol 6(4), 377-387.—Analyzes and disputes Vesey's philosophical analysis of volition, citing philosophers and other writers to discredit Vesey's analogy between perception and volition and shows that his innovative expressions are unnecessary and problematic. A simpler explanation is offered for the discrepancy between intention and motor action in anesthesia.

2105. Bertin, Morton A. (Office of Naval Research, Chicago, IL) **An overview of psychology in Latin America.** Chicago, IL: Office of Naval Research, 1974. 35 p.—Presents the 3rd in a series of works covering the status of foreign psychological research and activity, and includes discussions with prominent Latin American psychologists concerning representative work in process in 10 countries.

2106. Birnbrauer, Jay S.; Peterson, Christa R. & Solnick, Jay V. (U Western Australia, Nedlands) **Design and interpretation of studies of single subjects.** *American Journal of Mental Deficiency*, 1974(Sep), Vol 79(2),

191-203.—Considers that the emphasis upon group-statistical designs of experiments gives the impression that practitioners who work with I S at a time cannot do research. Arguments to the contrary and descriptions of how treatment of individual clients can be designed to yield valid conclusions regarding treatment efficacy are given in this paper. The utility of such studies for the design of future treatment plans is discussed. (30 ref) —*Journal abstract.*

2107. Brody, Eugene B. (U Maryland, Medical School, Inst of Psychiatry & Human Behavior, Baltimore) **The Journal of Nervous and Mental Disease: The first 100 years: II. 1882-1901. Persisting psychiatric themes and the renewed dominance of neurology.** *Journal of Nervous & Mental Disease*, 1974(Jul), Vol 159(1), 1-11.

2108. Brožek, Josef. (Lehigh U) **Soviet historiography of psychology: IV: History of psychology abroad.** *Journal of the History of the Behavioral Sciences*, 1974(Jul), Vol 10(3), 348-351.—In prerevolutionary Russia, translations of Western texts in psychology were readily and rapidly available. A Soviet bibliographic source cites only 3 postrevolutionary Russian works on the history of Western psychology. 3 additional publications by Shorokhova are reviewed here, and attention is drawn to a neglected 1930 text by Fingert and Shirvindt.

2109. Evans, B. T.; Blinnie, C. D. & Lloyd, D. S. (St Bartholomew's Hosp, London, England) **A simple visual pattern stimulator.** *Electroencephalography & Clinical Neurophysiology*, 1974(Oct), Vol 37(4), 403-406.—Describes an electronically controlled visual pattern stimulator which includes a matrix of light-emitting diodes which can be switched to provide pattern reversal over the entire display or any combination of sub-quadrants. The unit is portable and suitable for either manual or computerized operation. (French summary)

2110. Freeman, Linton. (U Hawaii) **Two problems in computer simulation in the social and behavioral sciences.** *Social Science Information*, 1971(Feb), Vol 10(1), 103-109.

2111. Freeman, Roderick A. (Wayne State U) **The case of the missing sense-data.** *Michigan Academician*, 1974(Spring), Vol 6(4), 409-416.—Disputes G. E. Moore's philosophical view that when we know or perceive a material object our sense data include a particular surface of the object and a sense-patch that includes color, size, and shape. Moore's deductions that the sense data are distinct from both the object and the mental act of seeing are specifically challenged. "Sense data" is said to be used equivocally, appropriately to refer to the sense-patch, but inappropriately to refer to attributes such as color and shape. This ambiguity, especially treating attributes as things, is blamed for violations of

ordinary language that led to Moore's disputed conclusions.—*R. D. Kahoe.*

2112. French, A. S. (U Alberta, Edmonton, Canada) **Synthesis of low-frequency noise for use in biological experiments.** *IEEE Transactions on Biomedical Engineering*, 1974(May), Vol 21(3), 251-252.—Describes a simple technique for generating white noise having sufficient power below 10 Hz to be useful in biological experiments.

2113. Frith, Uta. (MRC Developmental Psychology Unit, London, England) **The Georgian school of psychology: Impressions from a visit to Tbilisi.** *Bulletin of the British Psychological Society*, 1972(Jul), Vol 25(88), 197-201.—Describes and discusses the concept of "set," which is central to the Georgian school of psychology. Set is roughly defined as "instantaneous personality," a basic way of perceiving the environment to which the situation and the internal needs at a given moment give rise. The original experiments leading to set theory are described. Set theory has been applied to the study of individual personality differences, and thus to diagnosis, and it can serve as a model of behavior. Ongoing research, not hitherto published in English, is described: a study of the cognitive structures of educationally subnormal children, an experiment in subliminal perception, and a series of studies in semantics. It is concluded that the ideas and methods of psychology in Soviet Georgia are novel, exciting, and stimulating, and should be better known in other countries. (24 ref)—*R. S. Albin.*

2114. Fuchs, Alfred H. & Kawash, George F. (Bowdoin Coll) **Prescriptive dimensions for five schools of psychology.** *Journal of the History of the Behavioral Sciences*, 1974(Jul), Vol 10(3), 352-366.—Evaluated the utility of R. I. Watson's prescriptive dimensions (see PA, Vol 49:11036) by asking 68 judges from Division 26 of APA (a 28% return) to rate 36 defined "dimensions" in terms of their significance for the schools of structuralism, functionalism, behaviorism, gestalt psychology, and psychoanalysis. Reliability was satisfactory, permitting characterization of each school and comparisons in terms of relative emphasis with respect to subject matter, methods, theory, aims, and general scientific character.—*C. M. Franks.*

2115. Goldfarb-Maor, Suzanne. [An existential approach to Voltaire.] (Fren) *Acta Psychiatrica Belgica*, 1973(May), Vol 73(3), 333-355.—Presents an analysis of Voltaire's life and work from an existentialist's viewpoint. Special attention is paid to his ways of dealing with his existential anxiety. (French, Dutch, English, German, Italian, & Spanish summaries)

2116. Goulet, L. R.; Hay, Carl M. & Barclay, Craig R. (U Illinois) **Sequential analyses and developmental research methods: Descriptions of cyclical phenomena.** *Psychological Bulletin*, 1974(Sep), Vol 81(9), 517-521.—Examines K. W. Schaie's (see PA, Vol 39:14611) general model for the study of developmental problems and assumptions concerning the independence of phenomena related to cohorts, ages, and time-of-measurement. Scrutiny of available data from this perspective suggests the existence of behavioral phenomena which are cyclical and operate over a short term, as opposed to the longer-term behavioral change associated with generational (cohort) and secular change (time-of-meas-

urement) factors. It is suggested that such cyclical phenomena may result from adaptation to cultural and physical environmental conditions, or biological or psychological states, which are unique to (i.e., dependent on) particular times of birth, times of measurement, or ages. Examples of such phenomena and the methodological implications which result from their existence are presented. (19 ref)—*Journal abstract.*

2117. Iker, Howard P. & Klein, Robert H. (U Rochester, School of Medicine & Dentistry) **WORDS: A computer system for the analysis of content.** *Behavior Research Methods & Instrumentation*, 1974(Jul), Vol 6(4), 430-438.—WORDS is a computer-oriented system designed to elicit major content themes without recourse to a priori categorization systems. The system consists of a number of modular and independent programs that the user can configure in any fashion to process the data to be analyzed. Current information on WORDS, WORDS programs, WORDS systems logic, and on the availability of the system is presented.

2118. Kay, Harry. (U Sheffield, England) **Psychology today and tomorrow.** *Bulletin of the British Psychological Society*, 1972(Jul), Vol 25(88), 177-188.—Presents statistical data to illustrate recent unprecedented changes in society and an equally changing picture within psychology. The intellectual turmoil of today is compared to that of the 1st half of the 17th century; our problems, however, are of a different type and affect a world-wide community. The dominant issues are no longer technological but psychological and social; they concern the aims of our society and man's role in it. Psychology can make a contribution in 2 areas particularly. In education, the past is overemphasized. New concepts and methods should and can make it possible to teach adaptive skills that will enable children to adjust to further social changes. In the area of social-industrial psychology, increasing labor unrest points to the need for studies of patterns of work hours, shift systems, and the overall question of how far the individual worker should participate in the responsibilities of his firm. The many interlocking problems cannot be solved by the lawyer and economist alone. Psychologists are urged to take a more holistic view of man, one which denies neither his evolutionary heritage nor his achievements and adaptations.—*R. S. Albin.*

2119. Krech, David; Crutchfield, Richard S. & Livson, Norman. (U California, Berkeley) **Elements of psychology.** (3rd ed.) New York, NY: Alfred A. Knopf, 1974. xxiii, 874 p.—Presents the 3rd edition of a comprehensive introduction to the field of psychology. Topics include origins, growth, and development; thinking and language; intelligence; perception; conditioning, learning, and memory; motivation and emotion; conflict and adjustment; personality; and the individual in society. An appendix on psychological measurement and statistics is included. (22 p ref)

2120. Leedy, Paul D. (American U) **Practical research: Planning and design.** New York, NY: Macmillan, 1974. x, 246 p.—Presents a step-by-step manual for planning, designing, and carrying out a research project. Topics include tools of research, aspects of the research proposal, treatment of the data, different research methodologies, and writing the research report.

2121. Lydic, Ralph & Anson, John. (Texas Tech U) **A modified shock-delivery system for quail.** *Journal of the Experimental Analysis of Behavior*, 1974(Sep), Vol 22(2), 441-443.—Describes a successful method for implanting electrodes in bobwhite quail to study the effect of shock on operant or species-specific behavior. Data from an experiment using the device and illustrations of the implanting technique are included.

2122. Lyons, John P. & Gillio, Aldo. (Aerospace Medical Research Lab, Wright-Patterson Air Force Base, OH) **The human engineering electronic countermeasures simulator.** *USAF AMRL Technical Report*, 1972(Sep), No 72-59, 17 p.—Describes the Human Engineering Electronic Countermeasures (HEECS) and the procedures used in its operation. The basis of the HEECS is an AN/ALQ-T4 Electronic Warfare Crew Station (T-4) trainer reconfigured to operate as a research tool. The trainer interfaces with an IBM 360, model 40, which controls presentation of threat signals to the S and serves as an automatic data collection system. The IBM 360 also simulates on-board digital computers and digital logic circuitry for specific pieces of equipment. The capability and flexibility of this new systems simulator are discussed. Some of the problem areas addressed are (a) the communication problems between an analog machine with a reference voltage supply of +300 volts and a digital converter which accepts only a range of +5 to -5 volts; and (b) the problem of filtering out analog changes due to noise on the signal, as opposed to actual changes by the S. The system-effectiveness measures used by human engineers to evaluate performance are discussed.—*Journal abstract.*

2123. Mackenzie, Brian D. & Mackenzie, S. Lynne. (U Tasmania, Hobart, Australia) **The case for a revised systematic approach to the history of psychology.** *Journal of the History of the Behavioral Sciences*, 1974(Jul), Vol 10(3), 324-347.—Presents an assessment of behaviorism, followed by a systematic treatment of the major theories and influences in history of psychology. This historical analysis yields 3 suggested modifications, whose implications for modern psychology are discussed. (69 ref)

2124. Nordby, Vernon J. & Hall, Calvin S. (U California, Santa Cruz) **A guide to psychologists and their concepts.** San Francisco, CA: W. H. Freeman, 1974. 187 p. \$8.—Presents brief biographies of persons whose thinking has been influential and/or decisive in establishing the conceptual horizons of contemporary psychology, including A. Adler, G. W. Allport, A. Bandura, E. Fromm, R. B. Cattell, Freud, Jung, D. O. Hebb, K. Horney, A. Maslow, F. Heider, Pavlov, Piaget, C. R. Rogers, and B. F. Skinner.

2125. Pyke, S. W. **The female biogram.** *Ontario Psychologist*, 1974(Jun), Vol 6(2), 60-63.—Analyzes the biologically-based theoretical orientation of L. Tiger and R. Fox. It is concluded that neither they nor their opponents fully appreciate the complexity of the interplay between biology and environment.

2126. Pylyshyn, Zenon W. (U Western Ontario, London, Canada) **Are there discovery procedures?** *Bulletin of the British Psychological Society*, 1972(Jul), Vol 25(88), 189-192.—Questions the existence of discovery procedures in any of the 3 phases of scientific discovery

described by T. S. Kuhn. Normal Science—research in a mature area—is chiefly puzzle-solving; although for some classes of puzzles the methods of solution are so obvious that discovery procedures may be said to exist, most discoveries do not proceed in this codified manner. In Preparadigmatic Science—research in an area which does not yet have acknowledged theories and methods—efforts have been made to formulate discovery procedures, but such procedures exhibit serious shortcomings. Revolutionary Science is the phase of paradigm innovation, marked by the emergence of a new way of looking at things. Discoveries in this phase resemble the discovery of a hidden picture in a perceptual test. In this realm no discovery procedure can do much for science. The hope of finding objective empirical methods for capturing truth is regarded as a blind alley, one of the "myths of this age of heretic positivism." —R. S. Albin.

2127. Rivers, L. Wendell. (U Missouri, St Louis) **Behavioral objectives for Psychology, the Hybrid Science.** (2nd ed). Engelwood Cliffs, NJ: Prentice-Hall, 1974. v, 120 p.—Presents a workbook for the text, *Psychology, the Hybrid Science*, which stresses a systems approach to the learning of psychology. Study objectives, exercises, theories, equipment, procedures, and questions about the topic are included for each chapter of the text.

2128. Schlumpf, Margaret et al. (U Zurich, Switzerland) **Standardized excision of small areas of rat and mouse brain with topographical control.** *Biochemical Pharmacology*, 1974(Sep), Vol 23(17), 2447-2449.—Describes equipment for preparing brain slices with defined frontal planes and for punching cylindrical tissue pieces out of the slices according to given coordinates. The equipment has been used in studies of monoamines carried out with a miniaturized miniaturized method.

2129. Shengold, Leonard. **A parapraxis of Freud's in relation to Karl Abraham.** *American Imago*, 1972(Sum), Vol 29(2), 123-159.—Presents an interpretation of Freud's behavior over a paper of Karl Abraham's while the former was writing *Moses and Monotheism*. This is discussed in terms of passive wishes and the castration complex. (38 ref)

2130. Silverman, Irwin. (York U, Toronto, Ontario, Canada) **The experimenter: A (still) neglected stimulus object.** *Canadian Psychologist*, 1974(Jul), Vol 15(3), 258-270.—Examined applicable research articles published during 1 yr in 3 journals of the American Psychological Association to determine the effect of Es on study results. This examination and a mail survey of authors show that (a) the number of Es was specified in only 11% of the studies and (b) usage and systematic variation of multiple Es occurred in only 6% of the studies. The implications of these figures are discussed in light of other data collection efforts. Data are presented on Es' age, sex, relationships to investigators, and bases of selection. (French abstract) (23 ref)—*Journal abstract.*

2131. Tiberius, Richard G. (U Toronto, Ontario, Canada) **Freedom within control: A elaboration of the concept of reciprocal control in B. F. Skinner's Beyond Freedom and Dignity.** *Interchange*, 1974, Vol 5(1), 46-58.—Discusses Skinner's suggestion of a principle of reciprocity as a criterion for evaluating the acceptability of control. Reciprocity of control between controller and controllee is also considered to be superior as a

safeguard of human freedom. The use and study of dialogues in education is advocated as a way of extending reciprocity. (30 ref)

2132. Toulmin, Stephen E. (U California, Crown Coll, Santa Cruz) **Rules and their relevance for understanding human behavior.** In T. Mischel (Ed), *Understanding other persons*. Totowa, NJ: Rowman and Littlefield, 1974. xv, 266 p.—Considers the relevance of "rules" and "roles" to the notion of "persons" and argues that "rule explanations" and "law explanations" are linked or differentiated by a whole spectrum of likenesses and differences. Several varieties of description of explanation are critically compared in which rules are involved to account for human behavior, and a taxonomy of rules is drawn up which suggests that the phenomena, actions, thoughts, and utterances found in human conduct fall into 7 different types and orders of complexity. (15 ref)

2133. Trosman, Harry & Wolf, Ernest S. **The Bernfeld collaboration in the Jones biography of Freud.** *International Journal of Psycho-Analysis*, 1973, Vol 54(2), 227-233.—Delineates the successful collaborative effort of Siegfried Bernfeld and Ernest Jones in the roles of psychoanalytic historians, as revealed in their correspondence. (19 ref)

2134. Van de Merwe, C. (Erasmus U, Rotterdam, Netherlands) **Thesaurus of social research terminology.** Rotterdam, Netherlands: Rotterdam University Press, 1974. x, 471 p.—Provides a classified vocabulary of standardized terms that may be used for classification of social research methodology and technology. Major categories include research design, types of research, sampling, data collection, measurement, statistical analysis and interpretation of data, and reliability and validity of data and instruments.

2135. Wehner, Ernst G. (U Wurzburg, Psychological Inst, W Germany) **[The development of German psychology since 1945.]** (Fren) *International Review of Applied Psychology*, 1974(Apr), Vol 23(1), 47-53.—Notes that the reorganization of German psychological teaching and research since 1945 has created a scientific "establishment," rooted in national psychology but influenced by international movements, particularly the Anglo-American tradition, which has been a liberating influence.

## PSYCHOMETRICS AND STATISTICS

2136. Ace, Merle E. & Dawis, René V. (U British Columbia, Vancouver, Canada) **Type of content, type of score, and response inconsistency in comparison measures of preference.** *Educational & Psychological Measurement*, 1974(Sum), Vol 34(2), 221-230.—Conducted 3 experiments to determine the influence of type of content and type of score on response inconsistency. Types of content included color preference, preference for work situations, and preference for teacher characteristics. Types of scores were circular triad score on the upper triangle, circular triad score on the lower triangle, and inconsistency score from a comparison of upper and lower triangles; all scores were from a paired-comparison matrix. Results confirm a previous finding that type of score was a much more significant source of variation

than other instrument characteristics (type of content, number of items, or item format). Other findings cast doubt on the utility of the types of scores used as measures of a response inconsistency trait.—*Journal abstract*.

2137. Barcikowski, Robert S. (Ohio U) **The effects of item discrimination on the standard errors of estimate associated with item-examinee sampling procedures.** *Educational & Psychological Measurement*, 1974(Sum), Vol 34(2), 231-237.—Conducted a Monte Carlo study using item-examinee sampling procedures to examine the standard error of estimate for a given test's mean and variance. The main variables considered were test length, item difficulty, and item discrimination. Results indicate that optimal estimates (i.e., smallest standard error) of both mean and variance from a single item-examinee sampling plan may not be possible. *Journal abstract*.

2138. Boldt, R. F. (Educational Testing Service, Princeton, NJ) **Comparability of scores from different tests though on the same scale.** *Educational & Psychological Measurement*, 1974(Sum), Vol 34(2), 239-246.—Scores from tests in the same battery are put on scales which are the "same" in some sense, so that certain interpretations are made easier. This is often done when scores for different tests are obtained on different population segments, especially scores on newer, more varied batteries of test offerings. It is felt that traditional erroneous expectations about the meaning of scaled scores may be carried over into the new situations, and certain of these expectations are therefore discussed. It is suggested that when special properties of scales are considered valid for the users of a new battery, active technical steps beyond those of traditional steps for scaling are required to assure that these values are implemented.—*Journal abstract*.

2139. Bruchon, Marilou. (U Paris X—Nanterre, Lab of Experimental & Differential Psychology, France) **[Gestural expansivity: A dimensional study.]** (Fren) *International Review of Applied Psychology*, 1974(Apr), Vol 23(1), 3-15.—Tested the reliability and factorial consistency of various expressive and graphic variables, particularly their spatial modality of "expansivity." Ss were 72 male and female students 17-21 yrs old. Reliability of variables (test-retest) ranged from .64 to .82. The hypothesis of factorial consistency was confirmed for each of the 5 subtests: raising of arms, walking, posture, drawing, and writing. Thus specific and general expansivity were found to be reliable and consistent dimensions.—L. A. Ostlund.

2140. Carroll, Robert M. & Field, John. (U Maryland) **A comparison of the classification accuracy of profile similarity measures.** *Multivariate Behavioral Research*, 1974(Jul), Vol 9(3), 373-380.—Compared 13 profile similarity measures, using profiles generated from sets of 3 standards by adding random and normally distributed error components to the profile points of the standards. The 3 standards within each set were varied systematically, altering the elevation, scatter, and shape similarities between the standards. A correct classification occurred if the generated profile was most similar to the standard from which it was generated. Significant differences were found between the proportions of correct classifications for the 13 profile similarity measures under all condi-

tions. C. E. Osgood and G. J. Suci's (1952) and R. B. Cattell's (1949) measures were superior to or equal to all others. (17 ref)—*Journal abstract*.

2141. Echternacht, Gary. (Educational Testing Service, Princeton, NJ) **A quick method for determining test bias.** *Educational & Psychological Measurement*, 1974(Sum), Vol 34(2), 271-280.—Notes that of the several available methods for determining test bias, probably the most effective involves collecting criterion information. This process often presents difficulties, however, especially for the small test user and for the researcher who needs an immediate solution to a test bias question. A method is described for identifying and analyzing the nature of test bias. The method is only a preliminary analysis to be used before a criterion data collection process or concurrently with it.—*Journal abstract*.

2142. Gruen, Gerald E.; Korte, John R. & Baum, John F. (Purdue U) **Group measure of locus of control.** *Developmental Psychology*, 1974(Sep), Vol 10(5), 683-686.—Gave the Gruen, Korte, Stephens Internal-External Scale, a new measure of locus of control designed for use with children of differing socioeconomic and ethnic status, to a total of 1,100 black, white, and Spanish, moderately disadvantaged children from Grades 2, 4, and 6. The white children were compared to a sample of 155 affluent white children. As predicted, older children made more internal responses than younger children and the affluent children made more internal responses than the disadvantaged. Also, white children made more internal responses than either black or Spanish children. Among black Ss there was a significant sex difference, females being more internal than males. Further analyses with another sample of 50 white 2nd graders revealed that the locus of control scores were significantly related to grade point averages, but not significantly related to scores on the Otis-Lennon Mental Ability Test or the Crandall Social Desirability Scale. The scores on the measure of locus of control were generally skewed toward the internal end of the scale but were most discriminative at the 2nd-grade level. Internal consistency and test-retest reliability estimates for Gruen, Korte, Stephens Internal-External scores were moderately high.—*Journal abstract*.

2143. Holland, Thomas A.; Blakeney, Roger N.; Matteson, Michael T. & Schnitzen, Joseph P. (U Houston) **Empirical derivation of SVIB-Holland scales and conversion tables.** *Journal of Vocational Behavior*, 1974(Aug), Vol 5(1), 23-29.—Demonstrated significant relationships between the Holland's Vocational Preference Inventory (VPI) and the Strong Vocational Interest Blank (SVIB) in 2 validation samples totaling 596 male college students. Conversion equations were developed to use standard scores of SVIB scales, rather than items, to produce estimates of VPI scores.

2144. Hunter, Sara; Overall, John E. & Butcher, James N. (U Texas Medical Branch, Galveston) **Factor structure of the MMPI in a psychiatric population.** *Multivariate Behavioral Research*, 1974(Jul), Vol 9(3), 283-301.—A multistage factor analysis of the 373-item short form of the Minnesota Multiphasic Personality Inventory (MMPI) revealed 6 factors consistent with item-level analyses of a number of other investigators

and with those previously identified by the authors in analysis of the 1st 168 items: (a) Somatization, (b) Feminine Interests, (c) Depression, (d) Psychotic Distortion, (e) Low Morale, and (f) Acting Out. Scoring keys for the 6 factors are presented along with t-score profile sheets and t-score equivalents of raw factor scores derived from 708 normal college students. It is concluded that factor scoring promises to simplify pattern interpretation insofar as the more common code types tend to be represented in single factors. Moreover, since the MMPI-168 shows a factor structure consistent with the longer form, it seems justified to use it in situations requiring an abbreviated administration.—*Journal abstract*.

2145. Johnson, Richard W. (U Wisconsin, Madison) **Content analysis of the Strong Vocational Interest Blank for Women.** *Journal of Vocational Behavior*, 1974(Aug), Vol 5(1), 125-131.—Analysis of the Strong Vocational Interest Blank for Women (SVIB-W) shows that a variety of interest factors is represented on each of the Occupational and Nonoccupational scales. Several shortcomings of the SVIB-W (e.g., restricted range of interests represented in item pool, no Occupational scale for "outdoors" occupations, and questionable validity of Diversity scale) are noted.

2146. Mayerberg, Cathleen K. & Bean, Andrew G. (Temple U) **The structure of attitude toward quantitative concepts.** *Multivariate Behavioral Research*, 1974(Jul), Vol 9(3), 311-324.—Conducted a study with 311 graduate students to assess the dimensionality of attitude toward quantitative concepts. The instrument employed was a semantic differential consisting of 6 quantitative concepts—Algebra, Statistics, Mathematics, Numbers, Calculations, and Formulas—and 14 evaluative scales. An obliquely rotated principal factor analysis of the data yielded 2 categories of interpretable factors: (a) factors defined by all scales within 1 quantitative concept and (b) factors defined by a subset of scales across quantitative concepts.—*Journal abstract*.

2147. Nesselroade, John R. & Cable, Dana G. (Pennsylvania State U) **"Sometimes, it's okay to factor differences scores"**—**The separation of state and trait anxiety.** *Multivariate Behavioral Research*, 1974(Jul), Vol 9(3), 273-281.—Argues that contemporary psychometric policy and practice have tended to make the use of algebraic difference scores in psychological research taboo. To examine the relationships among factors obtained from separate occasion and difference score analyses, 141 undergraduates were administered the State-Trait Anxiety Inventory. The fit of the factor analytic model to difference score data was investigated and found to be quite good. Methodological issues related to properties of difference scores and their implications for personality research are briefly discussed. (17 ref)—*Journal abstract*.

2148. Silverstein, A. B. & Fisher, Gary. **Cluster analysis of Personal Orientation Inventory items in a prison sample.** *Multivariate Behavioral Research*, 1974(Jul), Vol 9(3), 325-330.—Clustered the responses of 500 male prisoners to the 150 items of the Personal Orientation Inventory (POI), using elementary linkage analysis. 5 major clusters accounted for 74 of the 150 items in the POI. Reliabilities of these clusters compared quite favorably with those of the original scales, but scale

scores could be predicted with only fair accuracy from cluster scores. The invariance of the present solution and the relative validity of cluster scores and scale scores remain to be determined.—*Journal abstract.*

2149. Thyssen, Sven. (Danish Inst for Education Research, Copenhagen) [Problems with subjects in psychological testing.] (Danh) *Skolepsykologi*, 1974, Vol 11(4), 304-312.—Discusses the premises which underlie psychological testing, especially with reference to the expectations and preconceptions of the Ss tested. Traditional tests aim at the objectification of human beings. It is suggested that new methods must be developed; several possible approaches are suggested.—P. Mylov.

2150. Young, Darrell D. (State University Coll New York, Buffalo) The semantic differential application as an affective measure. *Journal of Experimental Education*, 1974(Sum), Vol 42(4), 86-91.—Investigated the relationship between the Purdue Master Attitude Scales and a previously developed semantic differential test with physical science college students. Analysis of covariance indicates that the 2 tests were equally effective in their measurement of attitude change.

### Test Construction & Validation

2151. Boruch, Robert F. & Creager, John A. (Northwestern U) Measurement error in social and educational survey research. *ACE Research Reports*, 1972(May), Vol 7(2), 62 p.—Assesses stability of item response over time as an index of reliability in large-volume surveys. Review of measurement error and survey reliability is followed by report of 2 empirical studies using Student Information Forms of the Cooperative Institutional Research Program of the American Council on Education. Test-retest study of 202 freshmen at 3 institutions over 2-3 wk intervals yielded reliabilities of near unity for demographic and factual information and of .58-.88 for attitudinal information. 4,415 students from 246 colleges were compared for sex and race differences in reports of grade and age. Results suggest that biases in self-report of grades depend to some extent on sex, and that self-reports of age are sufficiently accurate for matching and stratification purposes. (6 p ref)—J. B. Francis.

2152. Corman, Louise & Budoff, Milton. (Research Inst for Educational Problems, Cambridge, MA) Factor structures of retarded and nonretarded children on Raven's Progressive Matrices. *Educational & Psychological Measurement*, 1974(Sum), Vol 34(2), 407-412.—Item responses of normal and educable mentally retarded children on Raven's Coloured Progressive Matrices were submitted to a principal components analysis and varimax rotation. 4 factors were obtained which corresponded to readily identifiable problem types. The factor structure for both groups of Ss was replicated by an independent sample. Comparability of factor structures of normal and retarded Ss indicate the factorial invariance of this test with children of different IQ levels.—*Journal abstract.*

2153. Danset, A.; Danset-Léger, Jacqueline & Winnykamen, Fajda. (U René-Descartes, Lab de Psychologie Génétique, Paris, France) [Application of a scale to study classroom behavior of 1,325 Parisian students.] (Fren) *Revue de Psychologie Appliquée*, 1974,

Vol 24(2), 87-102.—Presents and discusses the French version of the Devereux Elementary School Behavior rating scale (see PA, Vol 39:1707). A copy of the 47-item test and its factor analysis and item analysis are presented and discussed in detail. The test measures adaptation of children to the school milieu.

2154. Davis, Hilton. (City of London Polytechnic, School of Science & Technology, England) What does the P scale measure? *British Journal of Psychiatry*, 1974(Aug), Vol 125, 161-167.—Investigated the validity of the questionnaire scale of Psychoticism (P), by testing 103 patients in a hospital for abnormal offenders with Eysenck's Psychoticism, Neuroticism, Extraversion, and Lie scales as well as with personality scales derived mainly from the MMPI. Results indicate that (a) P is rather unreliable, (b) the items of the P scale do not consistently mark a factor separate from Neuroticism and Extraversion, (c) only 5 items meet the criteria for use as a scale, and (d) the P scale is a good measure of Emotionality. A comparison of 18 psychotics with 18 nonpsychotic offenders, matched individually for intelligence, resulted in no differences on P. On the basis of present results and previous research it is concluded that the evidence falsifies the hypothesis that the P scale is a measure of a dimension of Psychoticism, but that it might be construed as a measure of a broad semantic dimension of evaluation. (21 ref)—*Journal summary.*

2155. Kohler, Emmett T. & Graves, William H. (Mississippi State U, Office of Institutional Research) Factor analysis of the Disability Factor Scales with the Little Jiffy, Mark III. *Rehabilitation Psychology*, 1973(Sum), Vol 20(2), 102-107.—Analyzed Disability Factor Scales data obtained from rural South Central United States Ss.

2156. Levitt, Eugene E.; Aronoff, George & Morgan, C. Duane. (Indiana U, Medical School) A note on possible limitations on the use of the Harvard Group Scale of Hypnotic Susceptibility, Form A. *International Journal of Clinical & Experimental Hypnosis*, 1974(Jul), Vol 22(3), 234-238.—Tested the Harvard Group Scale of Hypnotic Susceptibility, Form A and found 2 possible limitations. The scale may be insufficiently valid with male Ss, and may nominate different hypnotically susceptible Ss and simulators than other scales. The prudence of E. Orne's proposed double-check on S selection is thus supported. (German, French & Spanish summaries)

2157. Lin, Yi-Guang. (U Michigan) A validity study of Factor B scale of Cattell 16PF in a college sample. *Acta Psychologica Taiwanica*, 1973, Vol 15, 1-5.—Conducted a validity study of Factor B (a measure of intelligence) of the 16 Personality Factor Questionnaire using 348 male and 406 female college students. The correlations with total scores on the American Council of Education Psychological Examination for College Freshmen were .16 and .43 for the male and female groups. Factor B scale also had lower correlations with performance measures in an introductory psychology course than other intelligence measures. Results suggest the limited usefulness of the Factor B scale for college students.—*Journal abstract.*

2158. Marshall, Nancy J. (Portland State U) Dimensions of privacy preferences. *Multivariate Behavioral*

*Research*, 1974(Jul), Vol 9(3), 255-271.—Describes the development of the Privacy Preference Scale, a 56-item, 5-choice summative scale. 198 undergraduates responded to the original scale, and 149 college students and 101 of their parents were Ss for the scale revision. 6 subscales were constructed from a principal axis factor analysis with unities in the diagonal of an 86-item pool; these focused on preferences for noninvolvement with neighbors, seclusion of the home, solitude, privacy with intimates, anonymity, and reserve. The ability of the subscales to differentiate between age and sex groups and their relationship to personality measures and to self-reported privacy-oriented behavior, are presented. (23 ref)—*Journal abstract*.

2159. Murray, Chris. (U Manchester, England) **Item analysis of the elementary school form of the Dogmatism Scale.** *Journal of Experimental Education*, 1974(Sum), Vol 42(4), 50-54.—Shortened R. L. Figert's paper-and-pencil 50-item elementary school form of the Rokeach Dogmatism Scale to produce a 20-item instrument with a test characteristic curve designed to maximally spread respondents around the midpoint of the score range. Reliability coefficients for selected subsample responses to the modified instrument by school-aged adolescents ranged from .81 to .77.

2160. Overall, John E. & Gomez-Mont, Francisco. (U Texas, Medical Branch, Galveston) **The MMPI-168 for psychiatric screening.** *Educational & Psychological Measurement*, 1974(Sum), Vol 34(2), 315-319.—Describes a convenient short-form administration of the MMPI. Rather than selecting items out of context, it is recommended that the abbreviated administration consist of the 1st 168 items of the standard MMPI. The usual scoring stencils can be applied to obtain scores which can be used to estimate *k*-corrected clinical scale scores by application of regression weights.

2161. Pyrczak, Fred. (California State U, Los Angeles) **Passage-dependence of items designed to measure the ability to identify the main ideas of paragraphs: Implications for validity.** *Educational & Psychological Measurement*, 1974(Sum), Vol 34(2), 343-348.—Items from a standardized reading test designed to measure the ability to identify the main ideas of paragraphs were administered without the associated paragraphs. The 2 samples consisted of graduate students and inner-city high school students. Half of the Ss in each sample were given brief general directions for answering the items in the absence of the passages, and the other half were given more extensive directions. The different directions did not have a significant effect on performance, but both groups in each sample answered a substantial number of items correctly. An index of passage-dependence was computed for each item, and the index values obtained from the responses of the graduate students and high school students were substantially correlated.—*Journal abstract*.

### Mathematical Models & Statistics

2162. Bray, Robert M. (U Illinois) **ANOVAR: A general program for one- and two-way analysis of variance.** *Educational & Psychological Measurement*, 1974(Spr), Vol 34(1), 137-139.—Describes a program which performs 1- and 2-way analyses of variance for

equal, unequal, and proportional cell sizes. A least squares analysis is performed when cell size is equal or proportional; otherwise, an unweighted means solution is used. The program also provides estimation of the percentage of variance accounted for by each of the factors and their interaction. A description of the program use, limitations, and availability is provided.—R. W. Covert.

2163. Carlson, James E. & Timm, Neil H. (U Pittsburgh) **Analysis of nonorthogonal fixed-effects designs.** *Psychological Bulletin*, 1974(Sep), Vol 81(9), 563-570.—Discusses nonorthogonal fixed-effects experimental designs using both the full-rank and reduction in error sums of squares conceptualizations of data analysis. The hypotheses tested by several commonly used methods of analysis are clarified, and suggestions for choice of the most appropriate procedure are proposed. (17 ref)

2164. Cramer, Elliot M. (U North Carolina, L. L. Thurstone Psychometric Lab, Chapel Hill) **A generalization of vector correlation and its relation to canonical correlation.** *Multivariate Behavioral Research*, 1974(Jul), Vol 9(3), 347-351.—Cites G. C. Chow's theorem (1966) which shows that the least-squares estimate of the regression coefficient matrix in multivariate linear regression maximizes the squared vector correlation coefficient between the dependent variables and a linear transformation of the independent variables. This paper shows that the problem is closely related to canonical correlation and that the correlation involved is the product of the canonical correlations between the independent and dependent variables. A symmetric generalization of vector correlation is given which applies to matrices with different numbers of variables and with linear dependencies among the variables. It is shown to be related to canonical correlation, as well as to a measure of correlation between sets of variables.—*Journal abstract*.

2165. Dickinson, Terry L. & Wolins, Leroy. (Colorado State U) **Analysis of repeated measures and other designs.** *Multivariate Behavioral Research*, 1974(Jul), Vol 9(3), 353-371.—Discusses procedures for using regression programs for the computing of analyses of variance. A procedure for coding matrices for experimental designs having nested and crossed factors is described. Several illustrations are given, and the limitation of the procedure with large repeated measures designs is discussed. A 2nd algorithm is offered for obtaining the sums of squares for nested factors and their interactions in such designs. (17 ref)—*Journal abstract*.

2166. Dwyer, James H. (U California, Adlai E. Stevenson Coll, Santa Cruz) **Analysis of variance and the magnitude of effects: A general approach.** *Psychological Bulletin*, 1974(Oct), Vol 81(10), 731-737.—Proposes a method for estimating the variance explained by each term of an analysis of variance model. The core of this method is the determination of an equation that expresses the total variance of the dependent variable as a weighted sum of variance components. Previous estimation methods are thus extended to include finite random effects, random effects, and fixed effects models in 1 parsimonious set of formulae. It is shown that previous methods overestimated the variance explained

by interactions in mixed models. The proposed procedure is demonstrated for the 2-way design, and a brief historical review is presented. (27 ref)—*Journal abstract*.

2167. Dziuban, Charles D. & Shirkey, Edwin C. (Florida Technological U) **On the psychometric assessment of correlation matrices.** *American Educational Research Journal*, 1974(Spr), Vol 11(2), 211-216.—Compared 3 procedures for assessing correlation matrices before applying factor analysis, using 4 matrices from the literature which represent somewhat disparate conditions. The 3 procedures were (a) M. S. Bartlett's test (1950); (b) inspection of the off-diagonal elements of the anti-image matrix  $S^2 R^{-1} S^2$  where  $R^{-1}$  is the inverse of the correlation matrix (H. F. Kaiser, 1963); and (c) the Kaiser-Meyer-Olkin Measure of Sampling Adequacy (MSA). It is concluded that the Bartlett procedure is sensitive to sample size and could lead to erroneous results when routinely applied to data preceding principal component analysis. The anti-image matrix analysis is useful but lacks enough decision rules except in extreme cases. MSA is considered the best of the 3 procedures because it provides specific assessment of individual variables and some decision rules. (17 ref)—E. J. Mason.

2168. Fulcomer, Mark C.; Schönemann, Peter H. & Molnar, George. (New York U) **Classification by linear and quadratic discriminant scores.** *Behavior Research Methods & Instrumentation*, 1974(Jul), Vol 6(4), 443-445.—Describes a program written in FORTRAN IV which provides 2 alternative Bayes solutions to problems of classifying an individual into one of  $K$  mutually exclusive populations on the basis of measurements taken on  $p$  predictor variables. The Bayes decision rule minimizes the total probability of misclassification.

2169. Hall, Ralph & Weir, Robyn. (U New South Wales, Sydney, Australia) **Laterality effects in risk preference: A test of portfolio theory.** *Acta Psychologica*, 1974(Oct), Vol 38(5), 351-355.—A central assumption in portfolio theory of risk preference is that for games with expected value constant the preference ordering of an individual should exhibit a single peaked preference function. This assumption was tested with 30 undergraduates by determining the level of stochastic transitivity satisfied by triples of pairwise preference proportions among 8 gambles. In only a small percentage of cases were the predicted levels of stochastic transitivity not satisfied. Results provide strong support for portfolio theory.—*Journal abstract*.

2170. Hays, James E. (American U) **A FORTRAN program to perform analysis of variance and analysis of cross-products.** *Behavior Research Methods & Instrumentation*, 1974(Jul), Vol 6(4), 449.

2171. Henry, Franklin M. (U California, Berkeley) **Variable and constant performance errors within a group of individuals.** *Journal of Motor Behavior*, 1974(Sep), Vol 6(3), 149-154.—Presents a mathematical model for the correct individual single score for a within-S series of errors about the target (for  $k$  trials). The commonly used absolute error under-represents or deletes the variable error component ( $V$ ). In correlational analysis, the constant error score should be  $C$  absolute, and  $V$  should be used unsquared in order to avoid curvilinearity; in general,  $r$  patterns across Ss are not

predictable from within-Ss relations. While  $V$  and  $C$  are necessarily independent within Ss, they usually exhibit substantial correlation across Ss; evaluation of the role of each is sometimes important. Linearity of regression is demanded; it, rather than nonskewness, is the important assumption in using  $r$ . If relations involving algebraic  $C$  are of interest, the correlation index may be required because of U-shaped regression. Several common statistical misinterpretations are discussed.—*Journal abstract*.

2172. Huck, Schuyler W. & Layne, Benjamin H. (U Tennessee) **Checking for proportional  $n$ 's in factorial ANOVAs.** *Educational & Psychological Measurement*, 1974(Sum), Vol 34(2), 281-287.—If the cell frequencies (i.e., the  $n$ 's) in a factorial analysis of variance (ANOVA) are not equal to one another, the researcher must determine whether or not the condition of proportionality is satisfied. Although several texts demonstrate how to test for proportionality, these discussions (a) give the impression that every cell must be tested and (b) are restricted to the case of a simple 2-factor ANOVA. In fact, however, only some of the cells need to be tested: 2 rules are provided by which the researcher can determine how many and which cells should be tested. A test for proportionality in a 3-way ANOVA is also provided, with comments on how the test can be generalized to higher-order factorial designs.—*Journal abstract*.

2173. Jackson, Douglas N. & Morf, Martin E. (U Western Ontario, London, Canada) **Testing the null hypothesis for rotation to a target.** *Multivariate Behavioral Research*, 1974(Jul), Vol 9(3), 303-309.—Proposes and illustrates a method for estimating the degree to which a factor rotation to an hypothesized target represents an improvement over rotation to a random target. The original hypothesized target matrix is transformed so that the direction of targeted salients is randomly determined, with the restriction that the new target is orthogonal to the original. When applied to a factor matrix of content and response style measures, the hypothesized target yielded a decidedly better fit to the data than did the random target.—*Journal abstract*.

2174. Keselman, H. J. & Murray, Robert. (U Manitoba, Winnipeg, Canada) **Tukey tests for pair-wise contrasts following the analysis of variance: Is there a type IV error?** *Psychological Bulletin*, 1974(Sep), Vol 81(9), 608-609.—Following a significant analysis of variance  $F$  test with a Tukey multiple comparison statistic for pair-wise contrasts is a popular testing sequence. J. R. Levin and L. A. Marascuilo (1972) maintain that by adopting this sequence the E may be committing a Type IV error, since the Tukey test could detect differences not judged significant by an analysis of variance. P. A. Games (1971), however, believes that the analysis of variance-Tukey sequence is legitimate and consequently maintains that one therefore could not commit a Type IV error. Data from the present investigation indicate that the likelihood of committing a Type IV error, even if it is a theoretically valid concept for the above testing sequence, is extremely small.—*Journal abstract*.

2175. Lord, Frederic M. (Educational Testing Service, Princeton, NJ) **Significance test for a partial correlation corrected for attenuation.** *Educational & Psychological Measurement*, 1974(Sum), Vol 34(2), 211-220.—Correc-

tion for attenuation is important for partial correlations because not even the sign of the partial between true scores can be inferred safely from the partial between observed (fallible) scores. Methods for inferring the corrected partial are discussed. It is noted that the corrected partial will sometimes have an overwhelming sampling error. A significance test is developed that largely circumvents this problem in those cases where it is enough to infer just the sign of the partial between true scores.—*Journal abstract.*

2176. Lund, Thorleif. (U Oslo, Inst of Psychology, Norway) **Comments on the Stone-Coles multidimensional scaling method.** *Multivariate Behavioral Research*, 1974(Jul), Vol 9(3), 343-346.—Demonstrates that G. J. Coles and L. A. Stone's (see PA, Vol 48:6071) model of multidimensional similarity analysis is not a content method, but rather an alternative to the ordinary distance methods. As such, it is argued, it is of limited value. (19 ref)

2177. Sherwin, Ronald G. & Wayman, Nien-Ling. (U Southern California, Los Angeles) **Nonhierarchical clustering technique: GROUPER.** *Behavior Research Methods & Instrumentation*, 1974(Jul), Vol 6(4), 446-448.—Describes a program written in FORTRAN IV which adapts to computer use a technique for reducing a larger interaction group to its underlying subgroups. The technique involves the creation of a sociomatrix in which the cell entries can be of any value and significance so long as they measure relations among the units of a group.

2178. Shinnors, Stanley M. (Sperry Rand, Great Neck, NY) **Modeling of human operator performance utilizing time series analysis.** *IEEE Transactions on Systems, Man, & Cybernetics*, 1974(Sep), Vol 4(5), 446-458.—Identifies the form of a method for modeling the human operator from actual input-output data and estimates the parameters of the identified model based on these data. The methodology for applying the time-series technique for determining the model of the human element in a feedback system is discussed, as well as an approach for determining the human model under various levels of stress. (47 ref)

2179. Shirai, Katsuhiko & Fujisawa, Hiromichi. (Waseda U, Tokyo, Japan) **An algorithm for spoken sentence recognition and its application to the speech input-output system.** *IEEE Transactions on Systems, Man, & Cybernetics*, 1974(Sep), Vol 4(5), 475-479.—Presents an algorithm which mathematically formulates the problem of sentence recognition, reduces the effective number of words that affects the recognition score, automatically detects the end of a sentence, and rejects a sentence that is logically invalid. The algorithm is applied to a practical situation as a speech command recognition and vocal response system.

2180. Spence, Ian & Graef, Jed. (U Western Ontario, London, Canada) **The determination of the underlying dimensionality of an empirically obtained matrix of proximities.** *Multivariate Behavioral Research*, 1974(Jul), Vol 9(3), 331-341.—Describes a completely automatic procedure based on the results of I. Spence's (1970a) extensive Monte Carlo experiment. The technique may be applied to matrices of order 12 to 36 inclusive. A

computer program, M-SPACE, which will implement the procedure, is available. (15 ref)—*Journal abstract.*

2181. Terranova, Carmelo. (Herbert H. Lehman Coll, City U New York) **A method to determine the congruity of dimensions across instruments.** *Educational & Psychological Measurement*, 1974(Sum), Vol 34(2), 247-251.—High school seniors responded to 2 semantic differential instruments before and after attending a summer program on college orientation. Principal components were extracted from the before and the after data. Before-after component combinations were found to be highly similar, thereby providing not only interpretations of change across the variables, but also a heuristic method for further research.

2182. Urry, Vern W. (U Washington) **Approximations to item parameters of mental test models and their uses.** *Educational & Psychological Measurement*, 1974(Sum), Vol 34(2), 253-269.—Derived equations to enable the graphic approximation of the item parameters of the stochastic mental test models (i.e., the generalized normal ogive and logistic models). The item parameters for the models are discriminatory power (a), difficulty (b), and lower asymptote of the item characteristics curve (c) where the item characteristic curve is the regression of the binary item on latent ability. In brief, c, can be approximated through visual inspection of the left-hand (lower) asymptote of the proportion passing the item plotted against the total test score minus the particular item. Thereafter a graph appropriate to the approximate c, can be consulted to convert an ordinary item total test point-biserial correlation and proportion passing the item into approximations of item discriminatory power (a) and item difficulty (b). The approximations can be used to provide a basis for screening items for tailored testing, to enable a determination of the appropriateness of a set of items for tailored testing, and to provide starting values for parameter estimation in maximum likelihood procedures. The conditions and assumptions necessary for an effective application of the method are delineated.—R. W. Covert.

2183. Wagner, Edwin E. & Hoover, Thomas O. (U Akron) **The effect of serial position on ranking error.** *Educational & Psychological Measurement*, 1974(Sum), Vol 34(2), 289-293.—Used words of known selection values arranged in completely counterbalanced order to show that overranking tends to occur at both terminal points of a series of rankings. The presence of other unforeseen "ranking errors" suggests that errors arising out of ranking procedures may be more complex than hitherto suspected.

2184. Williams, John D. (U North Dakota) **A simplified regression formulation of Tukey's test.** *Journal of Experimental Education*, 1974(Sum), Vol 42(4), 80-82.—Presents a simplified regression approach for Tukey's test for multiple comparisons. By constructing  $k-1$  regression equations (where  $k$  is the number of means) so that each mean is compared to every other mean, the computed  $t$ -values resulting from testing the significance of each regression weight can be compared to a modified value from the studentized range statistic.

2185. Zar, Jerrold H. (Northern Illinois U) **Probabilities of Rayleigh's test statistics for circular data.** *Behavior Research Methods & Instrumentation*, 1974(Jul),

Vol 6(4), 450.—Common circular data distributions include those involving compass directions or clock times. Means of variables such as angular directions or times of day may be computed by appropriate means, including Rayleigh's test. A program is presented written in FORTRAN IV which computes the probability of a given value of any of Rayleigh's statistics for a specified sample size.

2186. Zar, Jerrold H. (Northern Illinois U) **Probabilities for the Kolmogorov-Smirnov one-sample test statistic.** *Behavior Research Methods & Instrumentation*, 1974(Jul), Vol 6(4), 450.—The Kolmogorov-Smirnov statistic tests the goodness of fit of an hypothesized population distribution to a sample population distribution. A computer program written in FORTRAN IV is presented which computes the probability that the observed sample came from a population having the hypothesized distribution.

## PERCEPTION AND MOTOR PERFORMANCE

2187. Anderhuber, Raymond. [Study of audiomotor coordination.] (Fren) *Psychologie Française*, 1972(Jun), Vol 1(1-2), 55-60.—Describes the Audiokinetron, a new instrument designed to measure the coordination between auditory information and hand movements. The S's task consists of manipulating certain controls in order to maintain at its maximum a sound intensity which tends to decrease according to a pre-established program. Since the time required by the program to unfold depends on the accuracy of the performance at each moment, the quality of S's coordination is measured by the time it takes to execute the task. Data on the reliability of the device is not reported, but it is suggested that a 2nd trial be used as assessment, since considerable learning can take place during the 1st trial. As to the validity of the Audiokinetron, it successfully differentiated the performance of a group of radar operators and a group of electronic technicians from the performance of a random heterogeneous group ( $p < .001$ ). Zero order correlation was found with a test of intellectual efficiency.—A. Blasi.

2188. Bouwhuis, D. (Ed.). (Inst for Perception Research, Eindhoven, Netherlands) **IPO annual progress report, Nr. 8, 1973.** Eindhoven, Netherlands: Instituut voor Perceptie Onderzoek, 1973. vi, 61 p.—Presents the report of the Institute for Perception Research, including works on auditory perception, speech, visual perception, perception and motor skills, and instrumentation.

2189. Eriksson, E. Sture. (Uppsala, Sweden) **Movement parallax during locomotion.** *Perception & Psychophysics*, 1974(Aug), Vol 16(1), 197-200.—Conducted 2 experiments with a total of 14 paid female Os to investigate an hypothesis concerning the nature of movement parallax during locomotion. According to the hypothesis, movement parallax constitutes a basic perceptual-motor mechanism able to produce veridical information as to spatial relations in 3-dimensional space. Results verify the hypothesis in that information due to movement parallax unequivocally dominated both the effects of proximal relative size and spatial anisotropy.—Journal abstract.

2190. Gates, Anne & Bradshaw, John L. (Monash U, Clayton, Vic, Australia) **Effects of auditory feedback on a musical performance task.** *Perception & Psychophysics*, 1974(Aug), Vol 16(1), 105-109.—2 experiments examined the effects of various feedback conditions on performance by a total of 18 musically proficient adult volunteers on an electronic organ. Playing time scores showed complete absence of auditory feedback to have little or no detrimental effect; in fact, some Ss played fastest under this condition. Delayed auditory feedback (DAF), as expected, caused considerable performance decrement when compared with immediate auditory feedback (IAF). Extraneous prerecorded input as a distractor in the absence of auditory feedback ranked between mixed DAF-with-IAF, and pure DAF, which showed the greatest disruption. The possible role of auditory imagery in musical performance is discussed, together with 4 components which perhaps contribute to the standard DAF effect: distraction, error repetition, conflict with expectancies and auditory imagery, and presentation of 2 competing and conflicting signals (IAF and DAF). (26 ref)—Journal abstract.

2191. Grossberg, Mitchell. (Massachusetts Inst of Technology, Lincoln Lab, Lexington) **Failure of Bloch's law for simple reaction time.** *Bulletin of the Psychonomic Society*, 1974(Aug), Vol 4(2-B), 147-149.—Instead of the equal reaction times (RTs) for equal-energy flashes that Bloch's law requires, some previous studies demonstrated unequal luminance-related RTs. Because the flash luminance in those studies was not randomized over trials, J. D. Hildreth (1973) attributed those failures of Bloch's law to drifts in response. The present article demonstrates a failure of the law in experiments with randomized, equal-energy flashes in which the author served as the only S. A brief survey of studies suggests that failures of the law occur when the equal-energy flashes differ sufficiently in luminance.—Journal abstract.

2192. Knight, James L. & Kantowitz, Barry H. (Purdue U) **Speed-accuracy tradeoff in double stimulation: Effects on the first response.** *Memory & Cognition*, 1974(Jul), Vol 2(3), 522-532.—Compared a single-stimulation and 2 double-stimulation response conditions using explicit payoff matrices to vary speed-accuracy tradeoff with 60 female undergraduate Ss. Under accuracy payoff, response latency (RT<sub>1</sub>) to the 1st stimulus increased as interstimulus interval (ISI) dropped, but accuracy remained high and relatively constant. Under speed payoff, RT<sub>1</sub> was only slightly affected by ISI, but accuracy dropped as ISI decreased. Transmitted information rates consistently reflected detrimental effects of short ISI. In double stimulation, error response latency exceeded correct response latency. Furthermore, error response latencies were far more variable and more sensitive to changes in speed-accuracy condition than were correct response latencies. Under both speed and accuracy conditions, response latency to the 1st of 2 successive stimuli was faster if a response was also required to the 2nd stimulus. (22 ref)—Journal abstract.

2193. Weil, Andrew. **Parapsychology: Andrew Weil's search for the true Geller: II. The letdown.** *Psychology Today*, 1974(Jul), Vol 8(2), 74-82.—Describes how a

stage magician reproduced several of the supposed paranormal feats performed by Uri Geller. The magician revealed just how he could make an observer believe he actually saw the bending of a spike, ring, or key. Geller appears to be practicing his former trade—stage magic—thus leading people, including physical scientists, to treat him as a psychic phenomenon. Those who see Geller as having paranormal ability are engaged in "wishful thinking."—E. J. Posavac.

2194. Zobar, Dov. (U Maryland) **Amount and order of redundancy as determinants of continuous tracking performance.** *Journal of Motor Behavior*, 1974(Sep), Vol 6(3), 165-178.—Conducted an experiment with 12 male right-handed undergraduates which used a methodology for manipulating redundancy in continuous input tracks. The influence of redundancy on continuous tracking performance was compared to that found previously using discrete tracking tasks. 3 orders of redundancy were introduced in continuous tracks. Within each order of redundancy, 5 different amounts of redundancy were used by manipulating the sequential probabilities of the tracks' maximum amplitude values. The analysis of response lags and error data indicated that Ss did not respond as predicted to the conditioned probabilities of amplitude heights existing in the tracks, even when the probabilities were relatively high, but rather responded to different aspects of the tracks. Results are interpreted in terms of the unique characteristics of the continuous input and of the postulated sampling strategy employed by Ss. (17 ref)—*Journal abstract*.

### Perceptual Processes

2195. Allan, Lorraine G. & Kristofferson, A. B. (McMaster U, Hamilton, Ontario, Canada) **Psychophysical theories of duration discrimination.** *Perception & Psychophysics*, 1974(Aug), Vol 16(1), 26-34.—There are few quantitative theories of duration discrimination and few established empirical phenomena to guide theorizing. This paper discusses 3 such theories and several empirical findings. The theories assume that the discrimination is based only upon information extracted from the temporal extent of the stimulus pattern, and experimental evidence is presented that clearly supports this assumption for many stimulus patterns. Recent findings which indicate that duration information is analyzed in certain ways that are fundamentally different from other stimulus dimensions are reviewed, the duration discrimination psychometric function is examined, and the time-order error is discussed. The 3 theories are compared in terms of their ability to incorporate the empirical data. (49 ref)—*Journal abstract*.

2196. Auerbach, Carl & Sperling, Philip. (Yeshiva U) **A common auditory-visual space: Evidence for its reality.** *Perception & Psychophysics*, 1974(Aug), Vol 16(1), 129-135.—Conducted an experiment with 18 adult Ss which compared 2 hypotheses concerning the relation between auditory and visual direction. The 1st, the "common space" hypothesis, is that both auditory and visual direction are represented on a single underlying direction dimension, so that comparisons between auditory and visual direction may be made directly. The 2nd, the "disjunct space" hypothesis, is that there are 2 distinct internal dimensions, one for auditory direction

and one for visual direction, and that comparison between auditory and visual direction involves a translation between these 2 dimensions. Both of these hypotheses were explicated using a signal detection theory framework, and evidence was provided for the common space hypothesis. (29 ref)—*Journal abstract*.

2197. Buchwald, Charles & Blatt, Sidney J. (State U New York, Downstate Medical Ctr, Brooklyn) **Personality and the experience of time.** *Journal of Consulting & Clinical Psychology*, 1974(Oct), Vol 42(5), 639-644.—Conducted 2 studies to investigate the effects of personality, as dichotomized along a thought-action dimension, on time perception. Study 1 divided 27 10-48 yr old psychiatric patients into groups depending on whether their weighted color responses on the Rorschach exceeded or were exceeded by the sum of the movement responses. Ss with an introverted Experience Balance (EB) overestimated time, whereas Ss with an extraverted EB underestimated time. Study 2 used 24 normal undergraduates divided into high introverted and high extraverted based on the Maudsley Personality Inventory. 2 time judgments were obtained from each S, and the effect of situational factors (stress) as well as personality was noted. Results are similar to those of Study 1. The time estimation of the action-oriented Ss was significantly more influenced by situational factors than were the time judgments of the ideational Ss. The relationship between thought-action and time estimation was significant in both normal and clinical samples. (40 ref)—*Journal abstract*.

2198. Collings, Virginia B. (U Pittsburgh) **Human taste response as a function of locus of stimulation on the tongue and soft palate.** *Perception & Psychophysics*, 1974(Aug), Vol 16(1), 169-174.—Conducted 2 experiments with 15 and 28 paid university students who were nonsmokers. Taste recognition thresholds and psychophysical intensity functions were determined for table salt, sucrose, quinine, urea, and citric acid for 4 loci on the tongue and on the soft palate. Results show greater differences between loci than previously reported. Contrary to older data, the threshold for bitter was lower for the fungiform papillae at the front of the tongue and for the soft palate than for the vallate papillae. For all compounds, the slopes of the intensity functions varied with the locus of stimulation. The functions for most compounds were steepest at the vallate and foliate loci. (20 ref)—*Journal abstract*.

2199. Collyer, C. E. (Princeton U) **The detection of a temporal gap between two disparate stimuli.** *Perception & Psychophysics*, 1974(Aug), Vol 16(1), 96-100.—When a temporal gap was bounded by a light and a tone, gap detection performance by 3 experienced graduate and undergraduate students as a function of gap duration was well described by a simple model which characterized the discrimination as a purely temporal one. When the gap was bounded by 2 tones, performance was superior and seemed to depend on the frequency difference between the tones, but was not well described by the same model. It is suggested that the light-tone performance represents the operation of a central temporal discrimination mechanism, while the tone-tone cases represent the use by Os of nontemporal cues

originating in the peripheral auditory system.—*Journal abstract.*

2200. Davis, Christopher M. (Simon Fraser U, Burnaby, British Columbia, Canada) **The role of effective lever length in the perception of lifted weights.** *Perception & Psychophysics*, 1974(Aug), Vol 16(1), 67-69.—Objects are lifted through a system of body levers, and since the force required to lift objects decreases as the effective lever length is shortened, it was hypothesized that the perceived heaviness of objects would be less when they were lifted with the elbow bent than with it extended. Cans lifted from greater initial angles were consistently judged to be lighter by 32 blindfolded university students.

2201. Engen, Trygg & Gasparian, Florence E. (Brown U) **A study of taste preferences in young children.** *Journal of Safety Research*, 1974(Sep), Vol 6(3), 114-117.—As part of an investigation of the feasibility of using aversive tastes to keep children from ingesting harmful nonfood substances, the taste preferences of 102 3-6 yr olds were tested. Specially prepared fondant candies with 4 distinct flavors (cinnamon, cherry, peppermint, and horehound) were given to Ss in a paired comparison design. Taste preferences were generally consistent regardless of age, supporting the hypothesis that some tastes may be inherently aversive.—*Journal abstract.*

2202. Gross, Yigal; Webb, Ross & Melzack, Ronald. (McGill U, Montreal, Quebec, Canada) **Central and peripheral contributions to localization of body parts: Evidence for a central body schema.** *Experimental Neurology*, 1974(Sep), Vol 44(3), 346-362.—Asked a total of 41 university students in 4 experiments to point with the left index finger to different parts of the right arm and hand which rested on a surface completely concealed from vision. Results show that, under these conditions, the normal, resting upper limb was systematically perceived to be closer to the midline of the body on the right-left dimension, and closer to the body on the near-far dimension than it really was. The magnitude of some of these errors in localization increased systematically as a function of the duration of time that the limb was concealed from vision. Self-produced, random-like movements of the tested arm, hand, and fingers increased the magnitude of the systematic errors in localization. Results are discussed in relation to the concept of the body schema—the central representation of the body in the brain. They suggest that both central and peripheral variables contribute to the localization of the limb in space. (18 ref)—*Journal abstract.*

2203. Hilgard, Ernest R.; MacDonald, Hugh; Marshall, Gary & Morgan, Arlene H. (Stanford U) **Anticipation of pain and of pain control under hypnosis: Heart rate and blood pressure responses in the cold pressor test.** *Journal of Abnormal Psychology*, 1974(Oct), Vol 83(5), 561-568.—Studied heart rate and systolic blood pressure changes anticipatory to 3 stress conditions: (a) ice water pain to be felt at normal levels in the hypnotic nonanalgesia condition, (b) absent or greatly reduced ice water pain to be experienced following hypnotic analgesia suggestions, and (c) the pain of ice water to be hallucinated, with no ice water stimulation. Ss were 18 highly responsive hypnotic undergraduates; 12 of the Ss were also experienced in hallucination.

Despite the absence of pain, the maximum anticipatory rises in both physiological indicators appeared when the analgesic condition was anticipated. The anticipation of hallucinated pain also led to a rise greater than that in anticipation of experienced physically produced pain. (15 ref)—*Journal abstract.*

2204. Hoornaert, Johan. (Catholic U Louvain, Research Ctr for Motivation & Time Perspective, Belgium) **Time perspective theoretical and methodological considerations.** *Psychologica Belgica*, 1973, Vol 13(3), 265-294.—Reviews literature on psychological time and analyzes vaguely defined terminology in the area. Time perspective is defined as the perspective which exists and is continually elaborated, more or less consciously, by the reciprocal influence of global viewpoints on the past, present, and future. It occurs as a function of actual needs and value orientations and manifests itself in all aspects of behavior. Time perspective is contrasted with other aspects of psychological time (e.g., time calculation, time orientation, and time estimation). Specific dimensions of time perspective are described, and classified methods for studying them are presented. (7 p ref)—*S. Slak.*

2205. Indow, Tarow. (Keio U, Tokyo, Japan) **On geometry of frameless binocular perceptual space.** *Psychologia: An International Journal of Psychology in the Orient*, 1974(Mar), Vol 17(1), 50-63.—Discusses 2 fundamental postulates: (a) frameless binocular space as a Riemannian space of constant curvature  $K$ , and (b) simple and rigid mapping functions between physical space and the Euclidian map of perceptual space. Results of experiments using the Luneburg model, and of experiments attempting to embed perceptual configurations into a Euclidian space with the aid of metric multidimensional scaling are reviewed. The possibilities of testing the 2 postulates independently and of incorporating perturbation as to  $K$  or the mapping functions are discussed. (38 ref)—*R. D. Nance.*

2206. Jacobs, Diana E. & Galanter, Eugene. **Estimates of utility function parameters from signal detection experiments.** New York, NY: Columbia University, Psychophysics Lab, TR PLR-32, 1974. 18 p.—Develops a theory to make it possible to estimate the slope parameter of a presumed power law utility function from an analysis of data from a psychophysical signal detection experiment. An experiment to test the consequences of the theory is described.

2207. Kanthamani, H. (Inst for Parapsychology, Durham, NC) **Psi in relation to task complexity.** *Journal of Parapsychology*, 1974(Jun), Vol 38(2), 154-162.—Explored the question of how an S known to be a high scorer on extrasensory tasks would perform under circumstances in which the operations required of psi were made to seem increasingly "complex" as the experiment progressed. The basic method used was the "psychic shuffle," in which an S shuffles a deck of ESP cards to match a prearranged target order provided by the E. Modifications were made in the procedure from series to series by the introduction of a different E, by reversing the role of E and S, by moving the S and E into separate rooms, and by advancing to more complicated methods of randomizing the target order. 7 series, comprising 570 50-trial runs, were carried out with

significant results ( $p < .01$ ) in each. These results suggest that the apparent complexity introduced into the different series did not adversely affect the operation of psi.—*Journal abstract.*

2208. Kusajima, T. (Tokyo U, Japan) **Visual reading and braille reading: An experimental investigation of the physiology and psychology of visual and tactual reading.** New York, NY: American Foundation for the Blind, 1974. 60 p.—Reports results of comparative tests made over a 35-yr period to determine the similarities and differences between visual and tactile reading. It was found, for example, that both visual and tactile reading require the dual task of discerning distinctive features and integrating the differentiations into a total meaning. (39 ref)

2209. MacDonald, Ronald R. (U Stirling, Scotland) **Intertrial dependence in detection and recognition tasks.** *Acta Psychologica*, 1974(Oct), Vol 38(5), 357-365.—Gave detection and recognition tasks to 10 university students. Results of a Markov analysis revealed the existence of first-order intertrial dependence in error and response sequences from both detection and recognition tasks. Both feedback and the introduction of a burst of white noise between trials reduced intertrial dependencies in the error sequences. Task difficulty and intertrial periods affected intertrial dependence in the response sequence.—*Journal abstract.*

2210. Moore, H. J. & Guedry, Fred E. **Individual differences in vestibular information as a predictor of motion disturbance susceptibility.** Pensacola, FL: Naval Aerospace Medical Research Lab with US Army Aeromedical Research Lab, NAMRL-1200 & USAARL 74-11, 1974. 19 p.—Describes 2 experiments with 21 navy aviation officer candidates. Results do not demonstrate a relationship between a vestibular response variance measure and motion disturbance susceptibility at the conventional significance level. The test-retest reliability of the response variance measure was not found to be favorable.

2211. Natsoulas, Thomas. (U California, Davis) **The subjective, experiential element in perception.** *Psychological Bulletin*, 1974(Oct), Vol 81(10), 611-631.—Discusses the problem of sentence and how we are to understand it. It is argued, among other things, that sentence can find its place in psychological theory only in relation to perception and other modes of awareness. Basic issues examined pertain to the subjective, experiential element in perception and to the qualitative contents of perceptual and imaginal awarenesses. These issues are basic to the theory of the percept (and image) and have to do with where and how to locate the experiential element in a materialist world view. Subjective knowledge of qualitative contents is no less structural than knowledge by description; any advantage that exists in respect to a mode of knowing rather than in what can be known about them. The S "participates" in what he comes to know, but such participation does not make for knowledge unique to him. Nor does what he knows by this route count against qualitative contents belonging to brain processes, except perhaps for the problematic property of "grain." The discussion proceeds via review and evaluation of a variety of relevant views and arguments. (101 ref)—*Journal abstract.*

2212. Pressey, Alexander W. (U Manitoba, Winnipeg, Canada) **Measuring the Ponzo illusion with the method of production.** *Behavior Research Methods & Instrumentation*, 1974(Jul), Vol 6(4), 424-426.—In an experiment with 124 undergraduates, the Ponzo illusion was varied as a function of angle of oblique arms and measured by the method of production. Results show that the method produced very similar results to those obtained by the method of limits. Data also indicated that relatively stable individual scores could be obtained if about 6 judgments were required and if the targets elicited a large illusion.

2213. Rhine, J. B. (Inst for Parapsychology, Durham, NC) **Telepathy and other untestable hypotheses.** *Journal of Parapsychology*, 1974(Jun), Vol 38(2), 137-153.—Reviews the history of the main attempts to verify the existence of telepathy and the evident failure to do so. It is suggested that telepathy be indefinitely shelved until a conclusive test design is discovered. Other untestable hypotheses (e.g., spirit projection) are discussed.

2214. Salvatore, Santo. (Brown U, Hunter Lab of Psychology) **The ability of elementary and secondary school children to sense oncoming car velocity.** *Journal of Safety Research*, 1974(Sep), Vol 6(3), 118-125.—Asked 20 male and 20 female 5-14 yr old children to classify as slow, medium, or fast the velocity of vehicles approaching them on a 2-lane rural road in a residential setting. Age was positively associated with correct slow and medium judgments. Correct judgments of fast were inversely related to age, however. Females were more likely to correctly classify the dangerous fast vehicles. In contrast, males made more correct judgments over the whole speed range. Vehicle-associated characteristics (e.g., size and noise) also influenced the velocity judgment.—*Journal abstract.*

2215. Schneider, Bruce et al. (Columbia U) **A scale for the psychological magnitude of number.** *Perception & Psychophysics*, 1974(Aug), Vol 16(1), 43-46.—Constructed a scale from similarity ratings by 20 undergraduates of the 45 number pairs that can be obtained from a set of 10 integers. A nonmetric analysis of these similarity ratings showed that "psychological number" was a power function of number. (15 ref)

2216. Sekuler, Robert & Levinson, Eugene. (Northwestern U) **Mechanisms of motion perception.** *Psychologia: An International Journal of Psychology in the Orient*, 1974(Mar), Vol 17(1), 38-49.—Discusses the characteristics common to motion perception and other sensory responses. At threshold levels, responses of sensory mechanisms tend to be independent. At suprathreshold levels, sensory mechanisms tend to interact, usually in an inhibitory way. A narrow and simplified model of some parts of motion perception is presented. Threshold experiments, plus those on selective adaptation, aftereffect, subthreshold summation, and combinations of adaptation and summation are considered.—R. D. Nance.

2217. Spanos, Nicholas P.; Barber, T. X. & Lang, Gerald. (Boston U) **Cognition and self-control: Cognitive control of painful sensory input.** In H. London & R. E. Nisbett (Eds), *Thought and feeling: Cognitive alteration of feeling states.* Chicago, IL: Aldine, 1974. 239 p. \$8.95.—Undergraduates tested for baseline responses to a

painful stimulus were retested on the same stimulus after either the presence or absence of hypnotic induction, anesthesia instructions, or demands for honest reports. Ss' reports of pain were less affected by demands for honesty and more closely related to actual experiences than previously assumed. Instructions to use cognitive control over painful sensations reduced pain. (33 ref)

2218. Stanley, Gordon. (U Melbourne, NSW, Australia) **Adding and averaging angles: Comparison of haptic-visual and visual-visual information integration.** *Acta Psychologica*, 1974(Aug), Vol 38(4), 331-336.—In a study with 40 undergraduates, 1 group of Ss added and another group of Ss averaged pairs of angles presented simultaneously according to a factorial design. One set of angles was presented haptically and then visually, and the other set was presented visually on both occasions. Although analysis of variance indicated no main effect due to sensory mode of presentation, some interactions due to sensory mode were significant. The adding functions were parallel, but the averaging functions converged with a significant interaction, suggesting a differentially weighted integration model.—*Journal abstract.*

2219. Ullman, Montague; Krippner, Stanley & Vaughan, Alan. **Dream telepathy: Experiments in nocturnal ESP.** Baltimore, MD: Penguin, 1973. xiii, 300 p. \$2.95.—Discusses the theoretical, experimental, and methodological aspects of spontaneous telepathic dreaming based on the hypothesis that ESP occurs more often in dreams than in consciousness. Results of experiments conducted to determine whether a person acting as an agent can transmit his thoughts to a sleeping S are reported, including Ss' reactions, transcripts of dream sessions, and accounts of unusual telepathic communication. (8 p ref)

2220. Vicario, Giovanni. (U Trieste, Inst of Psychology, Italy) **[Psychophysics and the psychology of time.]** (Ital) *Rivista di Psicologia*, 1972(Jan), Vol 66(1-2), 19-33.—Suggests that the perception of time as a topic for psychophysics, has been inadequately represented in traditional approaches and in bibliographies. The study of time includes the study of frequency, duration, an instantaneous "only" event, and repetitions. Experimental methods that are appropriate for one of these areas may be unsuitable for others. Also, the duration of events and of the intervening periods are interactive, not independent. Psychophysical research should study conscious experience, not physics or biology; however, the dependence of conscious experience on physical dimensions is acknowledged.—*J. W. Black.*

2221. Weintraub, Daniel J.; Green, Gary S. & Herzog, Thomas R. (U Michigan) **Kinesthetic aftereffects day by day: Trends, task features, reliable individual differences.** *American Journal of Psychology*, 1973(Dec), Vol 86(4), 827-844.—Measured the kinesthetic aftereffect across 15 days in 3 groups of 37 undergraduates. Pre- and postinduction scores decreased across sessions for groups I > T (in which the inducing block was wider than test block) and increased for groups I < T (narrower) and no-I (control). The negative aftereffect for group I > T and the positive one for group I < T both declined toward zero across sessions; group no-I remained at zero aftereffect. Also found were errors of anticipation and of wedge position, low aftereffect-score

correlations across sessions (poor intraobserver reliability), and high reliability of pre- and postinduction scores. By combining residual change scores across sessions, reliable individual differences in induction susceptibility were secured; these proved unrelated to personality variables assessed by questionnaire. (19 ref)—*Journal abstract.*

### Auditory Preception

2222. Ades, Anthony E. (Massachusetts Inst of Technology) **How phonetic is selective adaptation? Experiments on syllable position and vowel environment.** *Perception & Psychophysics*, 1974(Aug), Vol 16(1), 61-66.—Used P. D. Éimas and J. D. Corbit's (see PA, Vol 50:2176) selective adaptation method to investigate the existence of detectors sensitive to consonants in any environment, irrespective of their acoustic properties. Exp I with 5 paid young adult Ss concerned consonants in initial and final position. Repeated presentation of a consonant-vowel (CV) syllable had an adapting effect on a CV continuum but not on a VC continuum. The converse was also true. In Exp II with 5 additional Ss, a detector for C<sub>i</sub> V<sub>i</sub> was fatigued by repeated presentation of C<sub>i</sub> V<sub>i</sub>, even though the adapting C<sub>i</sub> had very little acoustically in common with the test C<sub>i</sub>. It is concluded that there are detectors for phonemes, or possibly features, which respond to a fairly abstract representation of the input, but not so abstract that a C is represented the same in initial and final position.—*Journal abstract.*

2223. Dorman, M. F. (Haskins Lab, New Haven, CT) **Discrimination of intensity differences on format transitions in and out of syllable context.** *Perception & Psychophysics*, 1974(Aug), Vol 16(1), 84-86.—Presented 10 experienced adult Ss with pairs of stimulus syllables, or isolated transitions from them, which differed in the initial 60 msec of the signals by 0, 7.5, or 9 db. In the syllable context, the intensity differences were discriminated essentially at chance; in both the vowel and isolated transition conditions, the intensity differences were discriminated essentially perfectly. This outcome suggests that after the acoustic features of a stop-consonant-vowel syllable have been recorded into a phonetic representation, the acoustic information is relatively inaccessible for recall from auditory short-term memory.—*Journal abstract.*

2224. Eisler, Hannes & Montgomery, Henry. (U Stockholm, Psychological Lab, Sweden) **On theoretical and realizable ideal conditions in psychophysics: Magnitude and category scales and their relation.** *Perception & Psychophysics*, 1974(Aug), Vol 16(1), 157-168.—By spacing 10 stimuli (white noise) between 40 and 110 dB according to 2 criteria—equal response ambiguity (ERA) and equal discriminability (ED)—an attempt was made to construct an ideal case for magnitude estimation and category rating. The ideal case is defined by linear and constant Weber functions (SDs as a function of scale values) for the 2 scales, respectively. Altogether, 3 group and 2 individual magnitude- and category-rating experiments were run with these 2 spacings. It was found that the ERA spacing approximated the ideal case well for both Weber functions and the ED spacing only for the Weber function of the category scale. The general

psychophysical differential equation that relates scale values and Weber functions for the 2 scales allowed good prediction of the category scales from the magnitude scales and the Weber functions. Data suggest a distinction between phenotypic (empirical) and genotypic Weber functions, analogous to real and ideal cases in physics. (20 ref)—*Journal abstract*.

2225. Hammill, Donald D. & Larsen, Stephen C. **The relationship of selected auditory perceptual skills and reading ability.** *Journal of Learning Disabilities*, 1974(Aug-Sep), Vol 7(7), 429-436.—Reviews studies using correlational statistical procedures to examine the relationship of reading to measures of auditory discrimination, memory, blending, and auditory-visual integration. The consensus of this research suggests that the auditory skills are not sufficiently related to reading to be particularly useful for school practice. The conclusions provide information regarding the desirability of training these skills with the aim of increasing reading ability. The direction future research must take to explore further the relation of other auditory variables to reading is indicated. (55 ref)—*Journal abstract*.

2226. Lunney, H. W. (Macquarie U, Speech & Language Research Ctr, North Ryde, NSW, Australia) **Time as heard in speech and music.** *Nature*, 1974(Jun), Vol 249(5457), 592.—Describes a technique and a device for measuring perceptions of intervals between notes or beats in speech or musical rhythms. Data from this and previous studies suggest that the limit of discrimination is biologically imposed and that the brain mechanism involved in timing resembles a simple analog device, possibly of a delay time or a delay line type.

2227. Martin, Frederick N. (U Texas, Austin) **Minimum effective masking levels in threshold audiometry.** *Journal of Speech & Hearing Disorders*, 1974(Aug), Vol 39(3), 280-285.—Describes a procedure for masking during threshold audiometry. Illustrations are provided which show that use of an effective masking level equal to the threshold of the masked ear results in noise levels identical to those derived by the use of more complicated formulas.

2228. Mencher, George T. (U Nebraska, Lincoln) **A program for neonatal hearing screening.** *Audiology*, 1974, Vol 13(6), 495-500.—Describes a project at the University of Nebraska in which 10,000 infants tested for hearing loss in the nursery were Ss in a longitudinal study attempting to resolve questions regarding the prevalence of hearing disorders, the extent of false positive and false negative responses in the nursery, differential response patterns, and other sequelae. Subsequent studies involving stimuli and response types and the use of preconditioning auditory alerting signals are discussed. Lack of response to auditory stimuli when hearing is normal, response only to broad-band white noise, lack of response decrement, and the hyperactive response are considered, and some of the long-range implications of these forms of behavior are reviewed. (French summary)—*Journal abstract*.

2229. Penner, M. J.; Cudahy, E. & Jenkins, G. W. (Bell Telephone Lab, Holmdel, NJ) **The effect of masker duration on forward and backward masking.** *Perception & Psychophysics*, 1974(Jun), Vol 15(3), 405-410.—Investigated temporal masking of clicks by noise using forward

and backward masking paradigms. Both the noise duration and the temporal separation,  $\Delta T$ , between the click and noise were varied for 2 experienced student Os. For very brief  $\Delta T$ s (100 microsec) and for very long  $\Delta T$ s (100 msec), the duration of the masker did not greatly affect the click threshold. However, for intermediate  $\Delta T$ s (3 msec), the threshold increased by as much as 44 db as the noise duration increased from .1 to 100 msec. Temporal weighting functions, which describe the relative effectiveness of the noise as a function of  $\Delta T$ , are computed from these data.—*Journal abstract*.

2230. Pike, Ray; McFarland, Ken & Dalgleish, Len. (U Queensland, St Lucia, Australia) **Speed-accuracy tradeoff models for auditory detection with deadlines.** *Acta Psychologica*, 1974(Oct), Vol 38(5), 379-399.—Considers 2 neural models for response latency in auditory signal detection: R. Luce and D. M. Green's 1972 timing model and a modified counting model based on that of W. J. McGill (1967). The modified counting model is described in some detail. The experimental situation to which the models were applied was one where a deadline in response time was enforced on signal trials only or on noise trials only, the condition of deadlines on both cases having previously been studied by Green and Luce (1973). Ss were 6 male undergraduates. The results for mean latencies of the various categories of response, together with response probabilities, favor either the counting model or a dual process model. Data indicate either the operation of a dual process model or that the "interval of uncertainty" of the counting model may vary with bias position. Some consideration is also given to the possibility of differential residual response time components and it is concluded that such components may be important in the deadline situation.—*Journal abstract*.

2231. Rubin, David C. (Harvard U) **The subjective estimation of relative syllable frequency.** *Perception & Psychophysics*, 1974(Aug), Vol 16(1), 193-196.—13 university student Ss were able to judge the relative frequency of occurrence in English of nonmorphemic syllables independent of phoneme frequency. Results support a theory of speech perception based on the syllable as a unit as opposed to the phoneme.

2232. Satinder, K. Paul & Mastronardi, Laura M. (Lakehead U, Thunder Bay, Ontario, Canada) **Sex differences in figural after-effects as a function of the phase of the menstrual cycle.** *Psychologia: An International Journal of Psychology in the Orient*, 1974(Mar), Vol 17(1), 1-5.—Sought information on sex differences in auditory figural aftereffects (AFAE), taking into account the phases of the menstrual cycle. Ss were 10 female and 10 male volunteers 19 yrs old, tested individually using the method of limits with counterbalancing. Apparatus included audiogenerators and matched headphones. The magnitude of the aftereffect varied significantly in relation to the phase of the menstrual cycle. No significant sex differences were found when the phases of the menstrual cycle were ignored.—R. D. Nance.

2233. Toppino, Thomas C. (U New Mexico) **The underlying structures of sentences are not the primary units of speech processing: A reinterpretation of Bever, Lackner and Kirk's findings.** *Perception & Psychophysics*, 1974(Jun), Vol 15(3), 517-518.—Results of the experi-

ment of T. G. Bever et al (see PA, Vol 44:1654) were originally interpreted to imply that listeners segment speech on the basis of underlying sentence propositions rather than on the basis of surface constituent structure. Reexamination of the data reveals that the results do not support such a conclusion but offer more support for the surface structure hypothesis which was originally rejected.

2234. Warren, Richard M. & Sherman, Gary L. (U Wisconsin, Milwaukee) **Phonemic restorations based on subsequent context.** *Perception & Psychophysics*, 1974(Aug), Vol 16(1), 150-156.—Earlier experiments have shown that when 1 or more speech sounds in a sentence are replaced by a noise meeting certain criteria, the listener mislocalizes the extraneous sound and believes he hears the missing phoneme(s) clearly. The present experiment with 60 undergraduates confirmed and extended these earlier reports of phonemic restorations under a variety of novel conditions. All stimuli had some of the context necessary for the appropriate phonemic restoration following the missing sound, and all sentences had the missing phoneme deliberately mispronounced before electronic deletion (so that the neighboring phonemes could not provide acoustic cues to aid phonemic restorations). Results are interpreted in terms of mechanisms normally aiding veridical perception of speech and nonspeech sounds.—*Journal abstract.*

2235. Warren, Richard M. (U Wisconsin, Milwaukee) **Quantification of loudness.** *American Journal of Psychology*, 1973(Dec), Vol 86(4), 807-825.—Extended earlier experiments under "ideal" conditions to white noise, using a total of 600 undergraduates in 5 experiments. When known experimental biases were eliminated, half loudness was equal to half sound-pressure level (-6 db) from 45 through 90 db. The same simple relation held whether stimulation was through headphones or loudspeaker, and whether responses were numerical estimates or marks on a linear loudness scale. These findings and other evidence support the physical-correlate theory of sensory intensity and suggest that quantitative estimates of sensation are based not on the quantitative nature of sensory events as such but rather on the external events and relations they signify. (29 ref)—*Journal abstract.*

2236. Zelniker, Tamar; Rattok, Jack & Medem, Avraham. (Tel-Aviv U, Ramat-Aviv, Israel) **Selective listening and threshold for tones appearing on a relevant and on an irrelevant input channel.** *Perception & Psychophysics*, 1974(Aug), Vol 16(1), 50-52.—Threshold scores for tones appearing on shadowed and on nonshadowed messages were obtained from 16 undergraduate psychology students in order to test whether input presented on an irrelevant channel was attenuated when Ss attended to another channel. Comparisons were made between threshold scores obtained for each ear, when Ss shadowed messages appearing on that ear and when Ss shadowed messages appearing on the contralateral ear. The threshold scores in the 2 conditions were highly similar. Data are evaluated in the context of auditory target detection with targets identified by their verbal content vs their physical characteristics.—*Journal abstract.*

2237. Zwislöcki, J. J. & Sokolich, W. G. (Syracuse U, Inst for Sensory Research) **On loudness enhancement of**

**a tone burst by a preceding tone burst.** *Perception & Psychophysics*, 1974(Aug), Vol 16(1), 87-90.—Investigated the loudness level of a 2nd tone burst in a monotic burst pair as a function of the intensity and frequency of the 1st burst relative to the corresponding variables of the 2nd burst and as a function of the interburst time interval. The loudness level was measured with the help of a 3rd, a comparison burst whose frequency was the same as that of the 2nd burst. Results from groups of 4-10 listeners show beyond any reasonable doubt that loudness effects in pairs of sound bursts were controlled by 2 perceptual processes; loudness enhancement and loudness summation. The 1st refers to the loudness of the 2nd burst; the 2nd, to the overall loudness of the burst pair. The time and frequency functions of the 2 processes were fundamentally different.—*Journal abstract.*

2238. Zwislöcki, J. J.; Ketkar, I.; Cannon, M. W. & Nodar, R. H. (Syracuse U, Inst for Sensory Research) **Loudness enhancement and summation in pairs of short sound bursts.** *Perception & Psychophysics*, 1974(Aug), Vol 16(1), 91-95.—Presented a pair of short, temporally spaced sound bursts to groups of 4-7 listeners and requested them to match the loudness of a 3rd, a comparison burst to the overall loudness of the pair. A fundamentally different result was obtained from this task than when Ss were instructed to match the loudness of the comparison burst to that of the 2nd burst in the pair. Loudness-level changes occurring in the 1st situation were designated as loudness summation; those occurring in the 2nd situation, as loudness enhancement. Some parameters of both phenomena are studied. Results lead to the suggestion of a principle of maximum similarity in stimulus matching and to a reinterpretation of some earlier data. (15 ref)—*Journal abstract.*

### Visual Perception

2239. Andrews, D. P.; Webb, Jane M. & Miller, D. T. (U Keele, England) **Acuity for length comparison in continuous and broken lines.** *Vision Research*, 1974(Sep), Vol 14(9), 757-766.—In 2 experiments with the 3 authors as Ss, acuity for length comparison was compared in figures made of spots and of lines. Performance was always better for the line figures, regardless of configuration, size, or orientation. Large constant errors were found which differed between spot and line figures (among other variables). Efficiency of use of positional information was low compared with an ideal O. Results indicate that the high-grade positional data which Hubel units integrate to encode orientation or shape is not available for distance estimation. It is suggested instead that the positional specificity of Hubel units serve to encode distances and that the positional specificity is low. (French, German, & Russian summaries)—*Journal abstract.*

2240. Banks, Martin S. & Munsinger, Harry. (U Minnesota, Inst of Child Development, Minneapolis) **Pupillometric measurement of difference spectra for three color receptors in an adult and a four-year-old.** *Vision Research*, 1974(Sep), Vol 14(9), 813-817.—Used pupillometry as a measure of visual sensitivity in a female, color-normal adult and a 4-yr-old female with color-normal parents. Photopic spectral sensitivity determined with this measure agreed with the CIE photopic

visibility curve, although the child's data show a small long-wavelength decrement. Difference spectra for 3 color receptors were also measured. 3 distinct functions, similar to those obtained in adults by more traditional methods, were obtained in both Ss. (French, German, & Russian summaries) (23 ref)—*Journal abstract*.

2241. Budohoska, Wanda; Konorski, Jerzy; Celiński, Marek & Szymański, Leszek. (Nencki Inst of Experimental Biology, Warsaw, Poland) **The perception of competing visual patterns.** *Polish Psychological Bulletin*, 1974, Vol 5(2), 59-65. —Investigated the interaction of 2 familiar simple visual patterns unified into an unfamiliar one, using 12 adult Ss with normal vision. In Exp I Ss were trained for 4 days in recognizing 2 simple visual patterns: 1 linear and 1 dotted, shown for durations of 20, 30, 50, and 75 msec. In Exp II the linear pattern was placed above the dotted one. In Exp III the dots were above the lines. In Exp IV Ss were instructed to watch either the dots alone or the lines alone, to keep apart the 2 elements of the complex. Results show that while learning to recognize the simple patterns, Ss initially committed more errors with dots than with lines. This difference disappeared gradually so that on the 4th day of learning Ss performed equally well on both patterns. On combining the 2 patterns the number of errors increased only in relation to the dotted element. Results are discussed in the framework of J. Konorski's (1967) theory which assumes that there are antagonistic interactions between gnostic units involving the mechanism of lateral inhibition.—*Journal abstract*.

2242. Caplan, David; Holmes, Jane M. & Marshall, John C. (McGill U, Medical School, Montreal, Quebec, Canada) **Word classes and hemispheric specialization.** *Neuropsychologia*, 1974(Jul), Vol 12(3), 331-337.—Studied the effects of noun-class on recognition accuracy in the 2 visual half-fields. Data from 24 Ss (mean age = 25.5 yrs) who were given a word recognition task show that agentive nouns are more easily recognized than either simple nouns or category-ambiguous (noun/-verb) items with right visual field presentation, and that both agentive and category-ambiguous nouns are more easily recognized than simple nouns with left visual field presentation. Implications for a theory of hemispheric specialization are discussed. (French & German summaries) (23 ref)—*Journal abstract*.

2243. Cohn, Theodore E.; Thibos, Larry N. & Kleinstein, Robert N. (U California, School of Optometry, Berkeley) **Detectability of a luminance increment.** *Journal of the Optical Society of America*, 1974(Oct), Vol 64(10), 1321-1327.—Studied the psychometric function for the detection of a foveal luminance increment in 3 male Os. The signal to be detected was a modulation of a circular red target. For an ideal photodetector, the theory of signal detectability predicts that the index of detectability should rise linearly with the luminance of the luminance increment unless the O has some uncertainty concerning the parameters of the signal to be detected. The theory predicts that the slope of the receiver operating characteristic (ROC curve) should decrease with increasing uncertainty. In Exp I, in which luminance was varied, a nonlinear psychometric function and an ROC curve of relatively low slope were found. In Exp II, which included a pulsed background (pedestal)

whether or not the signal was presented, the predicted psychometric function was found. The ROC slope that was measured in rating experiments increased when the pedestal was used. Presumably, the pedestal provides the signal-parameter information that the O could not remember. It is concluded that the human O acts like an ideal photodetector that has imperfect memory concerning the signal to be detected. (18 ref)—*Journal abstract*.

2244. Corballis, Michael C. & Roldan, Carlos E. (McGill U, Montreal, Quebec, Canada) **On the perception of symmetrical and repeated patterns.** *Perception & Psychophysics*, 1974(Aug), Vol 16(1), 136-142. —4 experiments with a total of 116 university students investigated rapid perceptual judgments about tachistoscopically presented patterns that were either symmetrical about or repeated across a vertical axis. The same patterns were presented under 2 different instructional conditions: some Ss were to judge the 2 halves of each pattern "same" or "mirror"; others were to judge each pattern as a whole "symmetrical" or "asymmetrical." With dot patterns, reaction times (RTs) were faster for symmetrical than for repeated patterns when the 2 halves were close together, but not when they were separated, regardless of instructions. With simpler patterns made up of arrowheads and C-shapes, however, same RTs were faster than mirror, but asymmetrical RTs were marginally slower than symmetrical, regardless of spatial separation. The advantage of same over mirror did not seem to be simply a labeling effect. Results suggest that left-right symmetry was perceptually more salient than left-right repetition when the patterns were perceived holistically. By contrast, distinct patterns could be matched more rapidly when they were the same than when they were left-right mirror images.—*Journal abstract*.

2245. Davidoff, Jules. (U Coll Swansea, Wales) **The psychological relationship between lightness and saturation.** *Perception & Psychophysics*, 1974(Aug), Vol 16(1), 79-83.—Lightness and saturation, though independent in a physical sense, have often been seen to be psychologically related. Exp I used a multidimensional scaling technique to verify again this nonindependence for 2 untrained female undergraduate Os. Exp II, using a matching technique, quantified this relationship, giving the extent of the error in lightness for varying levels of saturation presented to 36 Os. This relationship was independent of hue if saturation was measured by the colorimetric purity of the hue. Errors in value (lightness on the Munsell system) were linearly related to colorimetric purity. (30 ref)—*Journal abstract*.

2246. Doehrmann, Steven. (U Michigan) **The effect of visual orientation uncertainty in a simultaneous detection-recognition task.** *Perception & Psychophysics*, 1974(Jun), Vol 15(3), 519-523.—Examined the processing of the outputs of visual orientation-sensitive mechanisms by higher order mechanisms. 3 female college students performed a simultaneous detection-recognition task. Variation in the number of possible orientations of task. A single straight line produced only slight, if any, changes in detection or recognition performance compared with findings from similar experiments. It is concluded that the outputs of all orientation-sensitive mechanisms are examined by higher order mechanisms. As the angular separation of 2 possible orientations increased, recogni-

tion improved in keeping with other reported findings. Comparison of detection with recognition indicated that the latter, under certain conditions, was superior to the former. (22 ref)—*Journal abstract*.

2247. Eriksen, Barbara A. & Eriksen, Charles W. (U Illinois) **Effects of noise letters upon the identification of a target letter in a nonsearch task.** *Perception & Psychophysics*, 1974(Aug), Vol 16(1), 143-149.—During a 1-sec tachistoscopic exposure, 6 graduate and undergraduate students responded with a right or left leverpress to a single target letter from the sets H and K or S and C. The types of noise letters (response compatible or incompatible) flanking the target and the spacing between the letters in the display were experimentally varied. In all noise conditions, reaction time (RT) decreased as between-letter spacing increased. However, noise letters of the opposite response set impaired RT significantly more than same response set noise, while mixed noise letters belonging to neither set but having set-related features produced intermediate impairment. Differences between 2 target-alone control conditions, one presented intermixed with noise-condition trials and one presented separately in blocks, gave evidence of a preparatory set on the part of Ss to inhibit responses to the noise letters. It is concluded that S could not prevent processing of noise letters occurring within about 1° of the target due to the nature of processing channel capacity and had to inhibit his response until he was able to discriminate exactly which letter was in the target position. (15 ref)—*Journal abstract*.

2248. Estes, W. K. (Rockefeller U, New York, NY) **Redundancy of noise elements and signals in visual detection of letters.** *Perception & Psychophysics*, 1974(Aug), Vol 16(1), 53-60.—Studied forced-choice detection in relation to heterogeneity of noise letters and multiple signal letters within tachistoscopic displays. 24 paid young adults served as Ss in both experiments. Curves plotting both probability and latency of correct detections vs number of redundant signals at different display sizes exhibited significant interactions with heterogeneity of the noise background, but did not differ as a function of similarity among redundant signals. Application of interactive and independent channels models indicated that noise redundancy operated to a major extent through effects of signal-noise confusability at the decision level but might also have involved perceptual interaction at the level of feature detectors.—*Journal abstract*.

2249. Estévez, Oscar & Spekrijse, Henk. (U Amsterdam, Lab of Medical Physics, Netherlands) **A spectral compensation method for determining the flicker characteristics of the human colour mechanisms.** *Vision Research*, 1974(Sep), Vol 14(9), 823-830.—Details the use of a spectral compensation technique with 5 color-normal males in which the silencing of either of the 2 classes of cones in the red-green spectral range resulted in similar flicker fusion curves for both the red and green cones. Results show that the isolated human medium and long wavelength cone systems did not exhibit low frequency attenuation even at high retinal illuminations. (French, German, & Russian summaries)

2250. Frith, Uta. (MCR Developmental Psychology Unit, London, England) **Scanning for reversed and**

**rotated targets.** *Acta Psychologica*, 1974(Oct), Vol 38(5), 343-349.—10 5-8 yr olds and 10 adults scanned arrays of identical shapes for mirror-reversed or 180°-rotated targets. The decomposition of scanning time into target identification time and context scanning time indicated that it took longer to identify reversed than rotated targets but equally long in both conditions to scan context. This confirms the notion of a specific difficulty in coding mirror-reversed shapes. When the shapes used contained vertical lines, scanning time increased while target identification time was unaffected. This was probably due to a tendency to fixate lines at right angles to the direction of scan and does not reflect a coding difficulty.—*Journal abstract*.

2251. Frith, Uta. (MRC Development Psychology Unit, London, England) **A curious effect with reversed letters explained by a theory of schema.** *Perception & Psychophysics*, 1974(Aug), Vol 16(1), 113-116.—Conducted 4 experiments with a total of 40 adult Ss in which it took longer to find a normal N embedded in a context of reversed Ns than it took to find a reversed N embedded in a context of normal Ns. This was true for other letters as well and can be explained by a theory of schema. This theory holds that there is a schema for the normal form of a letter based on past experience, and that this schema is not a static but a flexible construct which is sensitive to the immediate cognitive context. This property of the schema enables recognition even if the letter is presented in a deviating form. A deviation, such as mirror reversal, may at times be as acceptable as the normal form of the letter. This was the case when context stimuli in a scanning task consisted of reversed letters. If the target stimulus was the normal form of the letter, it was more difficult to detect since both context and target were accepted as the same letter.—*Journal abstract*.

2252. Gogel, Walter C. & Tietz, Jerome. (U California, Santa Barbara) **The effect of perceived distance on perceived movement.** *Perception & Psychophysics*, 1974(Aug), Vol 16(1), 70-78.—Developed equations to predict the apparent motion of a physically stationary object resulting from head movement as a function of errors in the perceived distances of the object or of its parts. In 2 experiments applying these equations, the perceived slant of an object was varied with respect to its physical slant by means of perspective cues. In Exp I, 72 undergraduate Os reported the apparent motion and apparent distance of each end of the object independently. Results are consistent with the equations in terms of apparent relative motion, but not in terms of apparent common motion. The latter results are attributed to the tendency for apparent relative motion to dominate apparent common motion when both are present simultaneously. In Exp II a direct report of apparent relative motion was obtained from 60 Os for illusory slants of a physically frontoparallel object. It was found that apparent rotations in the predicted direction occurred as a result of head motion, even though no rotary motion was present on the retina.—*Journal abstract*.

2253. Gogel, Walter C. (U California, Santa Barbara) **Relative motion and the adjacency principle.** *Quarterly Journal of Experimental Psychology*, 1974(Aug), Vol

26(3), 425-437.—Investigated the perception of motion of physically moving points of light in terms of the distinction between absolute and relative motion cues and the change in the effectiveness of the latter as a function of the frontoparallel separation between the points. In situations in which 2 competing relative motion cues were available to 24 right-handed undergraduate Ss to determine the perceived path of motion of a point of light, it was found that the relative motion cue between more adjacent points was more effective than the relative motion cue between more separated points. In situations in which only 1 relative motion cue was available, the effectiveness of this cue as compared with the absolute motion cue decreased with increased separation. Results are predictable from the adjacency principle which states that the effectiveness of cues between objects is an inverse function of object separation.—*Journal abstract.*

2254. Gregory, R. L. & Harris, J. P. (U Bristol, Medical School, England) **Illusory contours and stereo depth.** *Perception & Psychophysics*, 1974(Jun), Vol 15(3), 411-416.—Formulated a theory for illusory contours, which fill gaps in certain figures, and tested it with 12 medical students and technicians as Ss. It was suggested that nearer masking objects are perceptually postulated to "account" for gaps when these are unlikely. Results show that when stereoscopic depth information incompatible with this "perceptual hypothesis" was presented, the illusory contours were reduced in intensity or disappeared. (16 ref)—*Journal abstract.*

2255. Holmgren, John E.; Juola, James F. & Atkinson, Richard C. (U Maryland) **Response latency in visual search with redundancy in the visual display.** *Perception & Psychophysics*, 1974(Aug), Vol 16(1), 123-128.—Conducted 2 experiments with a total of 18 paid female undergraduates to investigate the effects of redundant display items upon response latency in a visual search task. In Exp I Ss searched 5-letter displays for a predesignated critical letter. Both critical and noncritical letters could be repeated in the displays. Mean response latency decreased markedly with increasing redundancy in the critical letter and was affected to a lesser extent by redundancy in the noncritical letters. In Exp II Ss were required to detect the presence of redundant letters in displays of from 2 to 5 letters, first with no information as to what letter might be repeated, then with knowledge of which letter would be repeated if the display contained a redundant letter. Response latencies in the former case were much slower than in the latter. Implications of these findings for current views of visual information processing are discussed.—*Journal abstract.*

2256. Kanizsa, Gaetano. (U Trieste, Inst of Psychology, Italy) [**"Gestalt errors" and other visual illusions.**] (Ital) *Rivista di Psicologia*, 1972(Jan), Vol 66(1-2), 3-18.—Presents 23 examples of visual illusions regarding color, length of lines, geometric forms, and movement. Errors are categorized as functions of the stimuli and of experience. No alternative theoretical explanations are offered. (16 ref)

2257. Kinchla, R. A. & Collyer, C. E. (Princeton U) **Detecting a target letter in briefly presented arrays: A confidence rating analysis in terms of a weighted additive effects model.** *Perception & Psychophysics*,

1974(Aug), Vol 16(1), 117-122.—Reports a visual experiment in which 3 Os rated their "confidence" that briefly presented 4-letter arrays contained one or more target-letter Fs. Their responses are interpreted as the product of a weighted additive combination of partial or "noisy" subjective representations of the 4 letters in each array.

2258. Manelis, Leon. (Stanford U) **The effect of meaningfulness in tachistoscopic word perception.** *Perception & Psychophysics*, 1974(Aug), Vol 16(1), 183-192.—Reviews studies of tachistoscopic word perception under 2 theoretical headings: the structural approach, in which the variables of interest were linguistic relations among letters, and the lexical approach, where the interest was in the availability of words in lexical memory. Results of a recent tachistoscopic recognition study question the importance of lexical availability by finding no difference in performance between meaningful words and well-structured, pronounceable nonwords. In the present 3 experiments with a total of 64 university students, further comparisons between words and pronounceable nonwords were performed, and a meaningfulness effect was demonstrated. The generality of this finding is discussed, and alternative models accounting for the effect are considered. 2 of these are capable of explaining structural effects as well as the meaningfulness effect: a translation model and a lexical discrimination net. (39 ref)—*Journal abstract.*

2259. Mial, R. P.; Smith, P. C.; Doherty, M. E. & Smith, O. W. (Bowling Green State U) **The effect of memory color on form identification.** *Perception & Psychophysics*, 1974(Aug), Vol 16(1), 1-3.—Previous studies have demonstrated that a form's identity affects the phenomenal hue of that form. This effect has been attributed to the operation of the "memory color" phenomenon. The present study with 6 female undergraduates was proposed to assess the effect of memory or characteristic color on form identification. Results indicate that memory color, rather than interacting with the object in such a manner as to aid identification, induces a bias toward identification of an object of the memory color.—*Journal abstract.*

2260. Monk, Timothy H. (U Nottingham, England) **Sequential effects in visual search.** *Acta Psychologica*, 1974(Aug), Vol 38(4), 315-321.—Demonstrated 2 types of repetition effect in a visual search situation with a total of 5 female university students and employees. A target dot of 1 of 4 possible brightnesses was randomly placed in a field of nontarget dots. A target repetition effect caused search time to be significantly reduced if the trial had a target dot of the same brightness as was used in the immediately preceding trial. An "edge effect" caused targets in the outer part of the display to have longer search times than those in the inner part. A spatial sequential effect caused targets appearing in the inner part of the display to have reduced search times if the target in the immediately preceding trial had also appeared in the inner part. Possible implications and mechanisms of the sequential effects are discussed.—*Journal abstract.*

2261. Munsinger, Harry & Banks, Martin S. (U California, San Diego) **Pupillometry as a measure of visual sensitivity among infants, young children, and**

**adults.** *Developmental Psychology*, 1974(Sep), Vol 10(5), 677-682.—Proposes pupillometry as an objective measure of visual sensitivity for infants, young children, and adults. To study the possible close relationship between pupillary contraction and perceived brightness for infants and young children, photopic pupillary sensitivity was measured for 5 1-yr-olds, 5 3-yr-olds, and 5 adults. Results support the utility of pupillometry as a sensitivity measure for infants and children, based on the demonstrated close agreement between the children's and adults' data in the study and adult data obtained by more traditional psychophysical techniques. (39 ref)—*Journal abstract*.

2262. Murch, Gerald M. & Paulson, James. (Portland State U) **An extension of the Riggs projection colorimeter.** *Behavior Research Methods & Instrumentation*, 1974(Jul), Vol 6(4), 403-406.—Describes a method for the construction and calculation of CIE chromaticity coordinates from a simple and inexpensive projection colorimeter. The device allows variation along the dimensions of hue, saturation, and brightness and specification of these variations in terms of chromaticity coordinates, dominant wavelength, relative luminance, and excitation purity.

2263. Olson, Richard K. (U Colorado) **Slant judgments from static and rotating trapezoids correspond to rules of perspective geometry.** *Perception & Psychophysics*, 1974(Jun), Vol 15(3), 509-516.—Compared the apparent static slant of trapezoids aligned in the O's frontal plane with the apparent plane of reversal for the same trapezoids when rotated. Slant responses of 9 paid undergraduate Os were similar in both static and rotation conditions, thus allowing description of the trapezoidal window illusion in terms of projective geometry. Linear perspective was systematically varied in the stimulus series to geometrically imply slants of 50, 60, 70, and 80°. Perceived slant corresponded remarkably well with these values. Results show that with the proper viewing conditions and response measures, Os may be rather good perspective geometers. (28 ref)—*Journal abstract*.

2264. Oyama, Tadasu. (Chiba U, Japan) **Perceived size and perceived distance in stereoscopic vision and an analysis of their causal relations.** *Perception & Psychophysics*, 1974(Aug), Vol 16(1), 175-182.—Effects of visual angle and convergence upon the perceived sizes and perceived distances of a familiar object (playing card) and a nonrepresentational object (blank white card) were investigated with 6 undergraduate psychology majors by means of a projector stereoscope with polarizing filters. Results indicate that size estimates increased nearly proportionally as the visual angle increased and decreased nearly linearly as the convergence increased. Distance estimates decreased nearly linearly as either the visual angle or the convergence increased. The ratio of the size estimate to the distance estimate for a given visual angle was almost constant irrespective of convergence. In this sense, the size-distance invariance hypothesis held. No clear effect of familiarity was found. Partial correlations were used to discriminate direct and indirect causal relationships between the stimulus variables and perceptual estimates. Both perceived size and perceived distance were found to

be determined directly by the 2 stimulus variables but mutually related only indirectly. (31 ref)—*Journal abstract*.

2265. Papaioannou, J. **Effects of retinal adaptation on brightness estimation in humans: Temporal considerations.** *Quarterly Journal of Experimental Psychology*, 1974(Aug), Vol 26(3), 514-519.—Asked 10 young adult volunteers to identify 1 of 7 possible luminance levels under Ganzfeld conditions. The luminance range investigated was .5-500.0 ft lm. Earlier findings on the subjective effects of a Ganzfeld on humans were verified. Ss performed significantly better under nonadapted than under adapted conditions. Under both conditions Ss tended to perform better after pupillary diameter had been fixed. Errors never exceeded 1 log<sub>10</sub> unit in magnitude.—*Journal abstract*.

2266. Pitt, I. T. & Winter, L. M. (Kodak Ltd, Research Div, Harrow, England) **Effect of surround on perceived saturation.** *Journal of the Optical Society of America*, 1974(Oct), Vol 64(10), 1328-1331.—Examined the effects of having a light or dark surround around a color, and, in particular, the effect these surrounds have on the perceived saturation of the color. Results of the experiments, with a total of 5 Os, show that a dark surround not only increased the apparent brightness of a color but also reduced its apparent saturation. It is concluded that for equivalence with a light-surrounded color, a color with a dark surround must have a higher purity.—*Journal abstract*.

2267. Plack, Jerelyn J. & Shick, Jacqueline. (U Minnesota) **The effects of color on human behavior.** *Journal of the Association for the Study of Perception*, 1974(Spr), Vol 9(1), 4-16.—Reviews the literature on the effects of color on physical, perceptual, and emotional responses and color preferences. Because color is related to many of these variables (e.g., blood pressure, pulse rate, judgments of size, weight, and distance, and personality characteristics) and since these variables have also been linked to motivation and motor performance, several hypotheses concerning the effects of color on motor performance are suggested. Implications for educational equipment and facilities are also examined. (75 ref)—*L. Gorsev*.

2268. Pressey, Alexander W. (U Manitoba, Winnipeg, Canada) **Evidence for the role of attentive fields in the perception of illusions.** *Quarterly Journal of Experimental Psychology*, 1974(Aug), Vol 26(3), 464-471.—Predicted, on the basis of the concept of attentive fields, that the position of the comparison line would systematically affect the amount of illusion displayed in the Ponzo configuration and in 2 impoverished forms of the Müller-Lyer illusion. In an experiment with 30 normally seeing undergraduates 10 of 12 predictions which seemed to be unique to assimilation theory were verified statistically, and the remaining 2 predictions were in the correct direction. A reversed Ponzo illusion, which was expected from the concept of attentive fields, was not exhibited. This latter result is explained by the fact that the Müller-Lyer illusion of elongation is normally greater than the Müller-Lyer illusion of shrinkage. (16 ref)—*Journal abstract*.

2269. Pressey, Alexander. (U Manitoba, Winnipeg, Canada) **Effect of size of angle on the ambiguous**

**Müller-Lyer illusion.** *Acta Psychologica*, 1974(Oct), Vol 38(5), 401-404.—Measured the ambiguous Müller-Lyer illusion as a function of the angle formed by the oblique lines. 60 undergraduates served as Ss. The illusion increased with an increase in the size of the angle, confirming the validity of the attentive field postulate of the assimilation theory of geometric illusions.

2270. **Putz, Vernon R. & Rothe, Robert.** (National Inst of Occupational Safety & Health, Cincinnati, OH) **Peripheral signal detection and concurrent compensatory tracking.** *Journal of Motor Behavior*, 1974(Sep), Vol 6(3), 155-163.—Introduced a Mackworth-clock monitoring task into a standard compensatory tracking task located at different lateral positions in the visual field of 48 right-handed undergraduates, while the tracking task was located in the center of the visual field. The variables tracking frequency and monitor position were hypothesized to produce mutual interference in the dual-task arrangement, and the spatial separation of the 2 tasks was assumed to adversely affect peripheral signal detection. As the tracking frequency increased, peripheral monitoring performance remained high, while tracking accuracy was reduced. The position of the monitor task did not affect monitoring performance but did influence tracking accuracy at the low tracking frequency. A divided-attention effect was found with respect to the monitoring task when both tasks were located directly in S's field of view. Eye-movement data provides some support for the notion of a functional visual field. (16 ref) —*Journal abstract.*

2271. **Pynte, Joël.** (U Provence, Lab de Psychologie Experimentale, Aix-en-Provence, France) **Readiness for pronunciation during the reading process.** *Perception & Psychophysics*, 1974(Aug), Vol 16(1), 110-112.—Required 24 French psychology students to read a series of 3 numbers projected on a screen. Depending on the series presented, the number projected at the center (test) required one or more syllables to be pronounced. Results show that the more syllables it took to pronounce it, the longer the eye fixation on that number lasted. This suggests that a mechanism of readiness for pronunciation co-occurs with visual processing.—*Journal abstract.*

2272. **Roufs, J. A.** (Inst voor Perceptie Onderzoek, Eindhoven, Netherlands) **Dynamic properties of vision: V. Perception lag and reaction time in relation to flicker and flash thresholds.** *Vision Research*, 1974(Sep), Vol 14(9), 853-869.—In order to relate perception lag to flicker thresholds, both were measured by the same 2 Ss under the same conditions. Perception lag obtained by 3 methods—double flash, eye and ear, and reaction time—were compared for foveal flashes at a dark background. The course of perceptive delay was measured as a function of the intensity of long flashes over a large intensity range. At medium intensities the results of the 3 methods agree. At low intensities, decreasing the intensity towards the threshold increased reaction time progressively faster than double-flash settings in the 1st decade above the threshold. In a 2nd series of experiments with 2 Ss, reaction times and double-flash settings at a low and a high background level were compared. The flicker fusion characteristics of the same stimuli were determined by modulating them harmonically. The change of perception lag at the low background level was

considerably greater than that at the high level on varying the flash intensity over a comparable range. Visual latency and flicker thresholds were related on the basis of 3 hypothetical general system properties. The course of perception lag obtained by double-flash settings is in agreement with that calculated from the flicker fusion curve. Latency curves at different background levels can be found from a generalized function and 2 parameters which are characteristic for sensitivity and inertia and which can be found either from flicker or flash thresholds. (French, German, & Russian summaries) (54 ref)—*Journal abstract.*

2273. **Roufs, J. A.** (Inst voor Perceptie Onderzoek, Eindhoven, Netherlands) **Dynamic properties of vision: IV. Thresholds of decremental flashes, incremental flashes and doublets in relation to flicker fusion.** *Vision Research*, 1974(Sep), Vol 14(9), 831-851.—3 experiments with a total of 3 Ss measured the thresholds of pairs of incremental and decremental flashes as a function of their duration, those of doublets as a function of the flash interval, and those of incremental flashes over a very large range of durations. The incremental and decremental threshold characteristics did not differ significantly, from which it is concluded that the excursion of the system responses to the flashes in the positive and negative direction must be approximately equally large if the flashes are to be detected. The doublet characteristics confirmed that the response to short flashes contained a definite 2nd phase. At low and high levels, however, they were practically isomorphous, which represents a deviation from the characteristics calculated from the De Lange flicker fusion curves. Measurements over a large range of duration showed that under certain conditions the threshold characteristics of rectangular increments displayed a minimum and that they were remarkably isomorphous at low and high levels. A refinement of the model introduced in order to explain these results yields a transmission curve which differs from the De Lange characteristics in the direction of greater attenuation at the very low frequencies and which is also isomorphous for the various background levels. (French, German, & Russian summaries) (40 ref) —*Journal abstract.*

2274. **Sekuler, Robert & Pierce, Scott.** (Northwestern U) **Perception of stimulus direction: Hemispheric homology and laterality.** *American Journal of Psychology*, 1973(Dec), Vol 86(4), 679-695.—Used response times to measure the difficulty of discrimination between various simple geometric figures in 3 experiments with a total of 40 undergraduates. Response times for "right-left" stimuli (3-sided squares with their open sides to the right or left) were not affected by vertical misalignment between the stimuli; those for "up-down" stimuli were affected. Left-right discriminations were no more affected by contralateral vs ipsilateral projection than were up-down discriminations. (17 ref)—*Journal abstract.*

2275. **Simmonds, M. B.** (U Canterbury, Christchurch, New Zealand) **Stereopsis and subjective contours.** *Perception & Psychophysics*, 1974(Jun), Vol 15(3), 401-404.—10 undergraduate volunteers rated perceived depth and contour clarity of figures containing binocularly disparate subjective contours. There was no tendency for stereoscopic depth cues to enhance the

perceived clarity of subjective contours. Disparity cues that were incompatible with monocular depth cues reduced the depth sensation but did not affect contour clarity. It is concluded that, although subjective contours can be perceived stereoscopically, they are seen in less depth than real contours with the same degree of horizontal disparity.—*Journal abstract.*

2276. Skowbo, D.; Gentry, T.; Timney, B. & Morant, R. B. (Brandeis U) **The McCollough effect: Influence of several kinds of visual stimulation on decay rate.** *Perception & Psychophysics*, 1974(Aug), Vol 16(1), 47-49.—Conducted an experiment to determine whether the decay rate of the McCollough effect could be differentially influenced by the type of visual stimulation that followed its induction. After acquiring this effect, each of 3 trained Os was exposed to achromatic gratings, homogeneous chromatic fields, natural visual stimulation, or complete darkness. Exposure to achromatic gratings caused a marked fading of the effect; the other types of stimulation were associated with similar and much less rapid decay.—*Journal abstract.*

2277. Taylor, M. M. & Aldridge, K. D. (Defence & Civil Inst of Environmental Medicine, Downsview, Ontario, Canada) **Stochastic processes in reversing figure perception.** *Perception & Psychophysics*, 1974(Aug), Vol 16(1), 9-25.—Measured the timing patterns of figural reversals, using as a stimulus figure a 3-dimensional surface which could be seen as dented or as bubbly. Transitions between the 2 forms were clear and abrupt and could not be voluntarily controlled by even a practiced O. The timing distributions of reversals, for 4 female adult Os who worked for 5 sessions of 36 min each, were incompatible with theories based on satiation-like effects; neither did they conform with a simple random-walk model. A random-walk model based on a finite majority decision device with memory described the data better than either. Data from 20 90-min observation periods for each of 2 Os were analyzed in detail according to this model, and it was found that the gross behavioral changes that sometimes occurred from period to period could usually be accounted for by a change of exactly 1 unit in one or another of the 3 parameters of the majority detector. The mathematical description of the model is given in a separate appendix to the paper. (20 ref)—*Journal abstract.*

2278. Thompson, Jack G. & Schiffman, H. R. (Rutgers State U) **The influence of figure size and orientation on the magnitude of the horizontal-vertical illusion.** *Acta Psychologica*, 1974(Oct), Vol 38(5), 413-420.—Performed 2 experiments to examine the effect of display size and figure orientation on the horizontal-vertical illusion. A total of 50 college students served as Ss. According to the visual field hypothesis of T. M. Künnapas (1957), if the relation of the figure components to the surrounding frame is held invariant neither experimental manipulation should exert an appreciable influence. However, both manipulations produced significant effects, indicating that the visual field hypothesis is untenable as the primary determinant of the horizontal-vertical illusion. An alternative explanation is discussed. (16 ref)—*Journal abstract.*

2279. Tynan, Paul & Sekuler, Robert. (Northwestern U, Cresap Neuroscience Lab) **Perceived spatial frequen-**

**cy varies with stimulus duration.** *Journal of the Optical Society of America*, 1974(Sep), Vol 64(9), 1251-1255.—Conducted 4 experiments with a total of 22 observers in which a sinusoidal grating appeared of higher spatial frequency when briefly flashed than when presented for longer durations. This effect was restricted to gratings of low spatial frequency. Time-dependent changes in the response of spatial frequency channels are a likely cause.

2280. Uhlarik, John J. & Osgood, Alan G. (Kansas State U) **The role of some spatial parameters of gratings on the McCollough effect.** *Perception & Psychophysics*, 1974(Jun), Vol 15(3), 524-528.—110 undergraduates with normal color vision were alternately adapted to vertical and horizontal gratings that consisted of black bars and colored slits. The slits of one grating were green and of the other, magenta. The widths of the black bars and the colored slits were varied independently during adaptation and testing. This design separates the relative influence of bar width, slit width, and spatial frequency on an orientation specific color aftereffect known as the McCollough effect. Black bar width had the major influence on the strength of the aftereffect, suggesting that the neurophysiological mechanism underlying the McCollough effect might consist of orientation specific units that are sensitive to both the widths of black bars and the chromatic characteristics of their surrounds.—*Journal abstract.*

2281. Van der Meer, H. C. (Catholic U, Psychological Lab, Nijmegen, Netherlands) **Aniseikonia: II. The influence of vertical and horizontal aniseikonia on the orientation of longitudinal horopters.** *Acta Psychologica*, 1974(Aug), Vol 38(4), 303-314.—Conducted a study with 7 advanced psychology students with normal vision to investigate the influence of vertical and horizontal aniseikonia on the orientation of the longitudinal horopter. Results indicate that vertical disparity had some influence on the orientation of the horopter formed by equating the primary subjective visual directions of the 2 eyes. This seems at variance with the hypothesis of a stable system of corresponding retinal elements.—*Journal abstract.*

2282. Van der Meer, H. C. (Catholic U, Psychological Lab, Nijmegen, Netherlands) **Aniseikonia: I. The influence of the magnification percentage of afocal meridional lenses on the magnitude of the stereoscopic depth effect.** *Acta Psychologica*, 1974(Aug), Vol 38(4), 283-302.—In 1964 K. N. Ogle postulated that the magnitude of the stereoscopic depth effect at horizontal aniseikonia is a linear function of the magnification percentage of meridional size lenses (axis at 90°). For vertical aniseikonia Ogle proposed the operation of 2 processes: an excitation process directly proportional to the vertical disparity and an inhibitory process that increases exponentially with the vertical disparity. In the present investigation with 22 normal-vision undergraduates these rules could not be confirmed. With horizontal aniseikonia most Ss showed, apart from a significant linear trend, also significant quadratic and/or cubic trends; furthermore, significant linear trends in opposite direction occurred. With vertical aniseikonia, a depth experience opposite to the expected direction occurred very frequently. Here, individual differences in the course of the curves representing the relationship

between the degree of the stereoscopic depth effect and the magnification percentage of the lens were particularly great. Results suggest that the processes which, according to Ogle, occur under aniseikonia are not compatible with the idea of a stable preformed structure of corresponding retinal elements, but that the lawfulness in the relationship disparity-depth experience arises only after a process of learning. (19 ref)—*Journal abstract*.

2283. Wildman, Kenneth N. (Nathaniel Hawthorne Coll) **Visual sensitivity at an edge.** *Vision Research*, 1974(Sep), Vol 14(9), 749-755.—In 3 experiments with a total of 3 Ss, the threshold for a small spot of light rose as it approached the edge of an illuminated area and gradually fell in the dark. The threshold rise on the illuminated side of the edge was dependent on the intensity of the illuminated field, absent at low intensity. Short duration flashes of both edge and test spot abolished the threshold elevation on the illuminated side of the edge regardless of field intensity. While the threshold rise may be associated with lateral inhibitory effects, the fall in the dark was due to stray light in the eye. (French, German, & Russian summaries) (16 ref)—*Journal abstract*.

2284. Worrall, Norman & Firth, Diane. (U London, Inst of Education, England) **The components of the standard and reverse Müller-Lyer illusions.** *Quarterly Journal of Experimental Psychology*, 1974(Aug), Vol 26(3), 342-354.—Experimental results show that the major factor in the Müller-Lyer reverse illusion is the apex-in and not the apex-out figure as previously supposed, and that for both standard and reverse figures there is a visual field effect. It is concluded that the Müller-Lyer oblique figures operate as 2 of many possible examples of a single underlying mechanism, and recent arguments that the Müller-Lyer is really 2 separate constituent illusions are not supported. (17 ref)

### Motor Processes & Performance

2285. Boucher, Jean-Louis. (U Ottawa, Ontario, Canada) **Higher processes in motor learning.** *Journal of Motor Behavior*, 1974(Sep), Vol 6(3), 131-137.—Used a linear displacement task to study the effects of verbal activity after knowledge of results (KR) and the time of its introduction in the learning process on the acquisition of a simple discrete motor task. The temporal occurrence of the interpolated act was systematically varied (3 and 10 sec immediately following KR) with 160 male right-handed undergraduate Ss. Reading polysyllables during the post-KR delay interval interfered with the learning process. Interference occurred whether the post-KR delay interval lasted 3 or 10 sec.—*Journal abstract*.

2286. Colegate, Robert L. & Hoffman, James E. (U Illinois) **Monitoring small eye movements with averaged EOG.** *Bulletin of the Psychonomic Society*, 1974(Aug), Vol 4(2-B), 149-151.—Studied the feasibility of measuring small ( $1-1\frac{1}{2}^\circ$  of visual angle) eye movements by small averaged electrooculograms (EOGs). Data from the 2 authors who served as Ss show that the latencies and amplitudes obtained by this procedure are in good agreement with results reported using other methods. The additional finding of different waveforms due to movement and voicing components makes the procedure

useful for studying the role of eye movements in reaction-time investigations of visual selective attention.—*Journal abstract*.

2287. de Lannoy, Jacques D. & Leyn, Guy. (U Louvain, Faculty of Psychology & Sciences of Education, Belgium) **[Body movements and sociometric status in male adolescents.]** (Fren) *Psychologica Belgica*, 1973, Vol 13(3), 239-245.—Recorded spontaneous body movements of 24 male 12-16 yr old adolescents during a 50-min observation period and classified them into 10 categories. Average duration of different types of body movement was related to the sociometric status of each S. The difference between "popular" and "isolated" Ss was significant only for movements involving contact with the S's own body, the amount of such movement being almost 3 times greater for the isolated Ss. Motivational aspects of spontaneous movements are discussed. (English abstract)—S. Slak.

2288. Golin, Sanford. (U Pittsburgh) **Effects of stress on the performance of normally anxious and high-anxious subjects under chance and skill conditions.** *Journal of Abnormal Psychology*, 1974(Oct), Vol 83(5), 466-472.—Studied whether a belief in personal control over a stressor would improve the performance of high-anxious Ss. Ss were 30 normal-anxious and 30 high-anxious undergraduates, classified according to Taylor Manifest Anxiety scale scores. The 2 groups did not differ on a complex learning task under nonstress conditions. Under a stress-chance condition, in which Ss were told they had no control over a shock stressor, the performance of high-anxious Ss was disrupted while that of the normals was not. In a stress-skill condition, Ss were told that they could control the stressor through their performance. Normals showed a marked improvement in performance in the stress-skill condition, but high-anxious Ss showed no significant improvement. (32 ref)—*Journal abstract*.

2289. Ishikawa, Takado. (Tokyo U of Education, Japan) **[Effect of the redundancy of stimulus events on speed and accuracy of motor response.]** (Jpn) *Japanese Journal of Educational Psychology*, 1973(Jun), Vol 21(2), 90-101.—4 age groups of 20 children and 1 group of 5 college students performed keypressing under 6 different stimulus conditions with high redundancy of approximately 70% in varying orders. In each condition, 300 trials with a 5-sec intertrial interval were given. Reaction time and error frequency were measured. Results indicate that the effect of the 2nd-order redundancy was stronger than that of the 3rd-order redundancy ( $p < .01$ ), that the 2nd-order components were used effectively in the 3rd-order redundancy, but that the 3rd order components were not used effectively under conditions in any order containing low redundancy. (English summary) (19 ref)—S. Choe.

2290. Kelso, J. A. & Stelmach, George E. (U Wisconsin) **Behavioral and neurological parameters of the nerve compression block.** *Journal of Motor Behavior*, 1974(Sep), Vol 6(3), 179-190.—Used the nerve-compression block with 10 male right-handed university students to investigate movement control in the absence of kinesthetic information. Implicit was the assumption that tactile and kinesthetic sensation were eliminated 5-10 min prior to motor function. Motor fibers in the ulnar

and median nerves of the upper preferred limb were tested at systematic intervals throughout the duration of the block application. When kinesthetic cut-off was assigned, Ss performed 3 tapping trials with vision and audition eliminated. Progressive reduction in nerve-conduction parameters (motor nerve conduction velocity and amplitude of the muscle action potential) occurred across and below the block, with significant decrements occurring as early as 15 min. Results indicate that motor impairment was a confounding factor in the use of the nerve block technique. (29 ref)—*Journal abstract*.

2291. Meijers, L. M. & Eijkman, E. G. (U Nijmegen, Lab of Medical Physics & Biophysics, Netherlands) **The motor system in simple reaction time experiments.** *Acta Psychologica*, 1974(Oct), Vol 38(5), 367-377.—Presents evidence that the variability of the motor system does not play an important role in the variability of simple reaction time. A model is proposed for the operation of the motor system in simple reaction-time experiments which consistently links single-cell neuronal activity with electromyographic activity and with response time. (15 ref)

2292. Merchant, John; Morrisette, Richard & Porterfield, James L. (Honeywell Radiation Ctr, Lexington, MA) **Remote measurement of eye direction allowing subject motion over one cubic foot of space.** *IEEE Transactions on Biomedical Engineering*, 1974(Jul), Vol 21(4), 309-317.—Describes the remote oculometer, a new instrument in which the video processing is performed by a minicomputer. This processor provides automatic calibration and linearization to each S and can supply the output eye-direction information in the form of either fixation-point coordinates on any specified fixation plane, azimuth and elevation, or direction cosines.

2293. Pack, D. Michael; Cotten, Doyce J. & Biasiotto, Judson. (Georgia Southern Coll, Marvin Pittman Lab School) **Effect of four fatigue levels on performance and learning of a novel dynamic balance skill.** *Journal of Motor Behavior*, 1974(Sep), Vol 6(3), 191-197.—Investigated the effect of fatigue on the performance and learning of the Bachman ladder task to determine if the relationship between activation and both the performance and learning data would support the inverted-U theory. 48 male college physical education students were randomly assigned to 4 groups. A level of fatigue as determined by heart rate (control, 120, 150, and 180 bpm) was assigned to each group. Each S was fatigued to his assigned level prior to the task and following each trial, was given 20 trials on Day 1 to learn the task while at his designated level, and then was given 20 additional trials on Day 2 under control conditions. On Day 1, 150 and 180 bpm impaired performance of the motor task. The learning score data indicated that 150 and 180 bpm had a detrimental effect on learning of the task. Both the activation-performance and the activation-learning relationships partially support the inverted-U theory. (16 ref)—*Journal abstract*.

2294. Sharp, R. H. & Whiting, H. T. (U Leeds, England) **Exposure and occluded duration effects in a ball-catching skill.** *Journal of Motor Behavior*, 1974(Sep), Vol 6(3), 139-147.—48 male university students attempted single-handed catches of lawn tennis balls delivered

by a mechanical projection machine. The within- and between-S variables in a split-plot factorial design were the period for which the ball was illuminated (VP) and the subsequent period of occlusion (OP). Both variables and their interaction were significant sources of variation. Generally the effect of VP diminished as OP was extended. This result is discussed in terms of (a) information processing time and (b) motion prediction. With respect to the 1st issue, the most important variable was not VP but a composite term  $VP + OP$ . On the 2nd issue, support is provided for an hypothesis to account for prediction error raised in a previous study. (17 ref)—*Journal abstract*.

2295. Sheerer, Nancy & Berger, Richard A. (Temple U) **Effects of various levels of fatigue on reaction time and movement time.** *American Corrective Therapy Journal*, 1972(Sep), Vol 26(5), 146-147.—Studied the effects of 3 different levels of fatigue on reaction time (RT) and movement time (MT). 16 college males were subjected to fatigue by doing a varying number of shoulder flexions. RT and MT were evaluated using the same response. Results show that fatigue had no significant effect on either variable. The techniques of analysis are discussed. It is concluded that the evidence suggests an adverse effect on RT and MT by increasing fatigue.—R. S. Albin.

2296. Shephard, Roy J. (U Toronto, School of Hygiene, Ontario, Canada) **Work physiology and activity patterns of circumpolar Eskimos and Ainu: A synthesis of I.B.P. data.** *Human Biology*, 1974(May), Vol 46(2), 263-294.—The International Biological Programme (IBP) collected data on the working capacity and activity patterns of 3 Eskimo populations and 1 Ainu group. All groups were of short stature, but showed a rapid secular trend towards increase of standing height. In the relatively acculturated Alaskan Eskimos, skinfold readings have apparently increased since 1963; the other groups remain thin, and total body fat is poorly correlated with skinfold readings. Strength of leg muscles and lean body mass were well developed in Igloolik; lean mass was relatively lower at Wainwright, but anaerobic power was still better than in a white population. In 3 of the 4 groups, aerobic power and related measures of work tolerance were much as in the sedentary white population. Figures for the Igloolik population were at least 20% greater, particularly marked in men who adhered to the traditional pattern of nomadic hunting. This is mainly attributed to the bursts of intense work and the high total energy demands of traditional hunting. Previous reports of poor working capacity in hunters may reflect the immediate influence of advanced chest disease. (21 ref)—S. L. Warren.

2297. Thorsheim, Howard I.; Houston, Lanning & Badger, Christopher. (Saint Olaf Coll) **Visual and kinesthetic components of pursuit-tracking performance.** *Journal of Motor Behavior*, 1974(Sep), Vol 6(3), 199-203.—Trained 74 paid undergraduates on a pursuit rotor for 10 trials with ambient illumination from a strobe light flashing at frequencies of either 2, 5, 10, 15, or 20/sec. A transfer trial followed, with a strobe-flashing frequency of 10/sec for all Ss. Results support hypotheses derived from J. A. Adams's (see PA, Vol 48:2177) closed-loop theory of motor learning that (a)

performance would improve during training as a function of amount of visual feedback available and (b) if after training visual feedback was reduced, performance would be maintained to the extent that reliance upon kinesthetic feedback had been learned as an alternate compensatory feedback loop.—*Journal abstract.*

## COGNITIVE PROCESSES AND MOTIVATION

2298. Bear, Gordon. (U Wisconsin, Madison) **Cognition of the relation between an event and a circumstance understood to explain the event.** *Memory & Cognition*, 1974(Jul), Vol 2(3), 491-496.—Proposes a model for the process of explanation, according to which (a) an event to be explained is understood to be a value on a particular dimension of variation, (b) a circumstance believed to explain the event is understood to be a value on another dimension of variation, and (c) the 2 dimensions are understood to be related such that the dimension whose value is to be explained is more likely to take that value when the dimension of circumstance takes its obtaining value than when the dimension of circumstance takes an alternative value. Evidence for the model is reported from a 2-part study in which a total of 65 university students made 2 judgments about a human action—which of 2 statements of circumstance specifying alternative values for a certain dimension was the better explanation for the action, and which of the same 2 statements described the case in which the action, or for certain items the opposite action, was more likely to occur. For each of 5 different actions, the judgments were significantly related as required by the model. (19 ref)—*Journal abstract.*

2299. Blum, Gerald S. & Porter, Marcia L. (U California, Santa Barbara) **Effects of the restriction of conscious awareness in a reaction-time task.** *International Journal of Clinical & Experimental Hypnosis*, 1974(Oct), Vol 22(4), 335-345.—Investigated the ascription of a proper role to consciousness in mental functions in the context of a visual-choice reaction-time task involving the presentation of an irrelevant auditory signal. 3 paid, high-hypnotic undergraduates were programed hypnotically in advance "not to hear" the irrelevant tone on half the trials; 3 paid, nonhypnotic undergraduate controls were given waking instructions to ignore the tone. The posthypnotic "ablation" of conscious awareness of the tone significantly attenuated its influence upon reaction time, whereas the control instruction had no effect. Results are suggestive in their implication of consciousness as a factor in the processing of cognitive events. (German, French, & Spanish summaries)—*Journal abstract.*

2300. Briggs, George E. (New Mexico State U) **On the predictor variable for choice reaction time.** *Memory & Cognition*, 1974(Jul), Vol 2(3), 575-580.—A survey of published research using the S. Sternberg information reduction task (1966, 1969) was made for the period 1966 to early 1973. It is proposed that a majority of the data are better described by a linear equation involving log positive set size than by one involving set size per se as the scale of the predictor variable. (47 ref)

2301. Briggs, George E.; Johnsen, Arthur M. & Shinar, David. (New Mexico State U) **Central processing uncertainty as a determinant of choice reaction time.** *Memory & Cognition*, 1974(Jul), Vol 2(3), 417-425.—Demonstrated in an experiment with 80 paid, right-handed undergraduates that central processing uncertainty ( $H_c$ ) can be derived to provide a single valued statement of the reaction-time (RT) information hypothesis  $RT = a + b(H_c)$  across test-stimulus sets and across several levels of test-stimulus probability in an information reduction task. The derivation procedure assumes successive tests of stimulus hypotheses with Bayesian revision of stimulus probabilities after failure of an initial test. Results show that the procedure could be generalized to data from single test stimuli in an information conservation task. Stimulus and response repetition effects were estimated for the information reduction task data. (17 ref)—*Journal abstract.*

2302. Coltheart, Max & Glick, Marcia J. (U Reading, England) **Visual imagery: A case study.** *Quarterly Journal of Experimental Psychology*, 1974(Aug), Vol 26(3), 438-453.—Describes a female student who, when presented with a word or a sentence, is abnormally proficient at spelling this material in reverse order. It is suggested that her superiority in this and in tachistoscopic performance is achieved principally because her internal visual representations are extremely resistant to disruption by other mental activities.

2303. Eckert, Ed & Kanak, N. Jack. (U Oklahoma) **Verbal discrimination learning: A review of the acquisition, transfer, and retention literature through 1972.** *Psychological Bulletin*, 1974(Sep), Vol 81(9), 582-607.—This review of the literature pertaining to verbal discrimination acquisition, transfer, and retention includes discussions of frequency theory, extensions to the frequency theory, and hypotheses independent of the frequency theory. It is generally concluded that the frequency theory is suitable for the explanation and prediction of data in experiments which require only recognition memory, and that other theoretical accounts or extensions are needed to predict and explain verbal discrimination problems which require processes other than simple recognition memory. (118 ref)—*Journal abstract.*

2304. Forster, Kenneth I. & Olbrei, Ilmar. (Monash U, Clayton, Vic, Australia) **Semantic heuristics and syntactic analysis.** *Cognition*, 1973, Vol 2(3), 319-347.—Conducted 5 experiments with a total of 90 Ss (most of whom were undergraduates) to investigate the hypothesis that the component of sentence processing time directly attributable to syntactic processing depends critically on certain semantic properties of the sentence. Using 2 different procedures, little evidence was found to support this view. Syntactic processing time tended to be constant for sentences of varying semantic plausibility but constant syntactic structure, and reversibility failed to affect sentence processing in a systematic way. Results indicate that the recovery of the underlying structure of a sentence is controlled by purely syntactic properties of the input. (French summary) (20 ref)—*Journal abstract.*

2305. Galin, David & Orstein, Robert. (Langley Porter Neuropsychiatric Inst, San Francisco, CA) **Individual differences in cognitive style: I. Reflective eye move-**

ments. *Neuropsychologia*, 1974(Jul), Vol 12(3), 367-376.

—Studied reflective eye movements in Ss whose vocations emphasize either verbal/analytic or spatial/holistic cognitive modes in 2 experiments. In Exp I, 18 male lawyers and 17 male artists (ceramicists) were asked questions demanding verbal or spatial thought; the 1st eye movement following the question was scored for both vertical and lateral directions. Ss differed only in the vertical direction, with ceramicists showing more "up" movements than lawyers. In Exp II, the effects of question type (verbal or spatial) were studied in the 2 original groups of Ss and in 19 nonspecialized undergraduates. Verbal questions evoked more right and more down movements than spatial questions. (French & German summaries) (18 ref)—*Journal abstract*.

2306. Hock, Howard S.; Gordon, Gregory P. & Whitehurst, Robert. (Florida Atlantic U) **Contextual relations: The influence of familiarity, physical plausibility, and belongingness.** *Perception & Psychophysics*, 1974(Aug), Vol 16(1), 4-8.—Obtained individual differences in a task requiring the same-different comparison of multiobject scenes. For some of the 32 paid university student Ss, performance depended on whether the objects were in a physically plausible arrangement. It was inferred that these Ss used internalized rule systems to interrelate arrays of objects into organized scenes. For the other Ss, performance depended on whether the objects belonged together, and whether their arrangement was familiar. It was inferred that these Ss dealt with each object on an individual basis, using information concerning belongingness and familiarity of arrangement to anticipate which objects would be present and where they would be located.—*Journal abstract*.

2307. Paivio, Allan & Begg, Ian. (U Western Ontario, London, Canada) **Pictures and words in visual search.** *Memory & Cognition*, 1974(Jul), Vol 2(3), 515-521.—A total of 102 university students in 3 experiments searched through an array of pictures or words for a target item that had been presented as a picture or a word. In Exps I and II, the pictures were line drawings of familiar objects and the words were their printed labels; in Exp III, the stimuli were photographs of the faces of famous people and their corresponding printed names. Search times in Exps I and II were consistently faster when the array items were pictures than when they were words. Search was also faster with pictures than with words as targets when the search array also consisted of pictures. Exp III yielded a completely different pattern of results: Search time with names as targets and faces as search array items was significantly slower than in the other 3 conditions. Results are most consistent with a dual-coding interpretation. That is, items that are cognitively represented both verbally and as nonverbal images can be searched and compared in either mode, depending on the demands of the task. The mode actually used depends on whether the search must be conducted through an array of pictures or words. (19 ref)—*Journal abstract*.

2308. Potts, George R. (Dartmouth Coll) **Incorporating quantitative information into a linear ordering.** *Memory & Cognition*, 1974(Jul), Vol 2(3), 533-538.—Required a total of 236 undergraduates in 3 experiments to learn linear orderings of 4 terms ( $A > B > C > D$ ).

Each pair of terms was described as being either "just barely," "moderately," or "very much" different on some meaningful dimension. 2 distinct strategies for coding this information were observed. Some Ss varied the spacing of the terms along some continuum, while others spaced the terms evenly along a continuum and inserted verbal tags to represent the quantitative information (e.g., A just barely B moderately C very much D). The former strategy was consistently superior. Performance did not vary as a function of the quantitative difference between the terms.—*Journal abstract*.

2309. Ray, Colette. (University Coll, Cardiff, Wales) **The manipulation of color response times in a color-word interference task.** *Perception & Psychophysics*, 1974(Aug), Vol 16(1), 101-104.—The relationship between word and color response times and color-word interference is of theoretical importance for understanding the interference phenomenon. In this experiment with 16 undergraduate Ss, color response times were manipulated by varying the size of the color-word set, but there was no corresponding change in interference. Since the manipulation of word response times consistently leads to such changes, this result has certain implications which are briefly discussed. (23 ref)—*Journal abstract*.

2310. Stone, George C. & Peeke, Shirley C. (U California, Langley Porter Neuropsychiatric Inst, San Francisco) **Relative frequency of attribute relevance and response times in visual search.** *Memory & Cognition*, 1974(Jul), Vol 2(3), 453-462.—Conducted 2 experiments, one using a between-Ss and one a within-Ss design, with a total of 36 university students and staff with normal color vision. Results show that response latencies to single attribute probe stimuli were longer when the target stimulus embodied 2 attributes (form and color) rather than a single attribute. The magnitude of this mixed-attribute effect was influenced by the probability of attribute relevance, but the probability effect was mostly due to a repetition effect, such that latencies on trials involving repetitions of the same attribute were shorter than when the relevant attribute was shifted. Implications of these results are drawn for the issues of holistic vs attributized representation of the target stimulus and serial vs parallel search of a set of attributes. Although no class of models can be ruled out on the basis of these experiments, constraints can be imposed on the versions of each that are compatible with the data presented. (24 ref)—*Journal abstract*.

2311. Thomas, Ewart A. (Stanford U) **The selectivity of preparation.** *Psychological Review*, 1974(Sep), Vol 81(5), 442-464.—Examined the extent to which preparatory processes are selective (a) between 2 performance measures, speed and accuracy; (b) within a processing stage (e.g., stimulus encoding and response execution); and (c) among possible stimulus presentation times. Results of 3 experiments with 12 Ss show that the appearance of selectivity between speed and accuracy depended on whether these variables were considered over the possible preparatory states on a given trial, over the trials within an experimental condition, or over different conditions. The relevance of this result to the measurement of processing capacity is discussed. Selectivity within processing stages was demonstrated by

applying a parametric processing model to data from letter-matching tasks in which the identity of the 1st letter was probabilistically related to that of the 2nd letter. In these tasks, reaction time differences between physical and name matches and between *same* and *different* responses depended on the stimulus and response contingencies and on the stimulus presentation times. A method is presented for resolving observed error rates into components that reflect the accuracy of each processing stage. (42 ref)—*Journal abstract*.

2312. Travers, Jeffrey R. (Swarthmore Coll) **Word recognition with forced serial processing: Effects of segment size and temporal order variation.** *Perception & Psychophysics*, 1974(Aug), Vol 16(1), 35-42.—Serial processing was forced by displaying words 1 letter or letter cluster at a time to a total of 20 paid, normally seeing adult volunteers in 2 experiments. Letters or clusters appeared in adjacent spatial positions and in rapid sequence, followed immediately by a mask. Under these conditions, there was a sharp increase in the percentage of words correctly identified as the size of the letter clusters presented in series increased. In a control condition without masking, designed to permit parallel processing across clusters, words were identified near-perfectly regardless of the size of the clusters displayed. Words displayed 1 letter at a time without masking were identified fairly well even when letters were presented in random order. Results are interpreted as evidence that skilled readers tend to process letters within words in parallel.—*Journal abstract*.

2313. Ullrich, James R. & Painter, John R. (U Montana) **A conjoint-measurement analysis of human judgment.** *Organizational Behavior & Human Performance*, 1974(Aug), Vol 12(1), 50-61.—Obtained rank order preferences from 32 undergraduate judges for a set of hypothetical job applicants varying simultaneously on the 3 attribute dimensions of intelligence (IQ), experience (E), and motivation (M). The resulting ordinal matrices were analyzed by polynomial conjoint measurement techniques to determine if the judges were using a specific configural model, the distributive polynomial ( $IQ + E$ )M, or a nonconfigural additive model,  $IQ + E + M$ . It is concluded that few Ss utilized the configural strategy in this task, and that most judgments could be described with an additive model.—*Journal abstract*.

2314. Wannemacher, Jill T. (Bryn Mawr Coll) **Processing strategies in picture-sentence verification tasks.** *Memory & Cognition*, 1974(Jul), Vol 2(3), 554-560.—Investigated the encoding and comparison strategies used by 7 paid undergraduate Os in matching pictures and sentences in each of 2 experiments. The location of the mismatch or difference between a sentence and a picture was varied, and the latencies of same-different responses were compared as a function of whether the mismatch occurred in the sentence subject, verb, or object. Sentences were presented auditorily and varied in both voice and reversibility. Pictures either preceded or were presented simultaneously with the sentences. In all cases, Ss adopted a serial self-terminating comparison strategy and a surface structure encoding strategy. The comparison was terminated as soon as a mismatch was encountered, and actives were processed in the order

subject-verb-object, whereas passives were processed in the order object-verb-subject.—*Journal abstract*.

2315. Wyer, Robert S. (U Illinois) **Some implications of the "Socratic effect" for alternative models of cognitive consistency.** *Journal of Personality*, 1974(Sep), Vol 42(3), 399-419.—Views the Socratic effect, or the tendency for cognitions to increase in consistency once they have been made salient to an S in close temporal proximity, as a criterion for the validity of alternative theoretical formulations of cognitive organization. 3 experiments were performed to test the generality of this effect in a total of 75 paid undergraduate Ss. Beliefs hypothesized to be related in a manner described by 4 different laws of mathematical probability became more consistent over time; these changes were similar in magnitude regardless of the importance of the issue to which the beliefs pertained, and regardless of whether these beliefs were evaluative or nonevaluative. However, consistency as defined by congruity theory, balance theory, and the principles of symbolic psycho-logic did not increase once the cognitions involved were made salient. Implications of these findings for cognitive organization processes are discussed. (34 ref)—*Journal summary*.

### Learning & Thinking & Conditioning

2316. Barclay, J. R. et al. (U Colorado) **Comprehension and semantic flexibility.** *Journal of Verbal Learning & Verbal Behavior*, 1974(Aug), Vol 13(4), 471-481.—4 studies of cued recall using a total of 136 undergraduates as Ss produced evidence that interpretation of familiar, unambiguous words varied with their sentential contexts. Each recall cue mentioned some property of a target word's referent, a property which was not explicitly identified during input. Cues were more effective when the properties were relevant, rather than irrelevant, to the events described by corresponding acquisition sentences. Results raise considerations pertinent to theories of semantic encoding, to semantic theories in linguistics, and to the role of normative data in psycholinguistic theories of comprehension. (31 ref)—*Journal abstract*.

2317. Bracewell, R. J. & Hidi, S. E. (Ontario Inst for Studies in Education, Toronto, Canada) **The solution of an inferential problem as a function of stimulus materials.** *Quarterly Journal of Experimental Psychology*, 1974(Aug), Vol 26(3), 480-488.—Varied the stimulus materials presented in 3 ways to 96 graduate students to assess the effect on performance of problems involving implicational rules. The 3 factors were natural vs arbitrary relationship between the terms of the problem, concrete vs abstract problem material, and order of the presentation of the terms in the rules. The natural relationship condition facilitated performance compared with the arbitrary relationship condition. This difference is explained in terms of differential cognitive load. A significant interaction between materials and order factors is attributed to semantic differences in the rules.—*Journal abstract*.

2318. Branthwaite, Alan. (U Keele, England) **A note comparing three measures of subjective probability, their validity and reliability.** *Acta Psychologica*, 1974(Oct), Vol 38(5), 337-342.—Compared 3 measures of subjective probability—estimates out of 10, confi-

dence ratings, and time to decide—with 12 male undergraduates as Ss. The validity and reliability of these measures were also investigated. Estimates out of 10 and confidence ratings were found to be closely similar measures, but the results from decision times were not so closely comparable. However, the results might offer sufficient support for the use of decision time when there are strong advantages for a scale which does not require Ss' active participation and deliberation.—*Journal abstract.*

2319. Brehmer, Berndt. (U Umea, Sweden) **Effects of cue validity and task predictability on interpersonal learning of linear inference tasks.** *Organizational Behavior & Human Performance*, 1974(Aug), Vol 12(1), 17-29.—Conducted an experiment where 32 pairs of undergraduate Ss learned 2-cue linear inference tasks from each other and from the feedback from the task. Results show that (a) Ss did not develop optimal inference policies, (b) the degree of optimality was inversely related to task predictability, and (c) Ss' performance in tasks which required them to use only 1 cue did not exceed that in tasks which required them to use 2 cues. The latter result is interpreted in terms of the Ss' tendency to develop policies in interpersonal learning that served both to increase achievement and to decrease the differences between the judgments made by the Ss in the pair. (20 ref)—*Journal abstract.*

2320. Bujak, Franciszek. [Subjective evaluation of probability of events by school children.] (Polh) *Roczniki Filozoficzne: Annales de Philosophie*, 1972, Vol 20(4), 143-150.—Asked primary school children to show the arrangement of various events of a 2-colored disk with different proportions of green and blue fields. The test revealed 3 stages in the development of appreciating the probability of perceptively legible events: deterministic-mechanistic, purely deterministic, and indeterministic. Results are discussed in terms of the principle of cognitive conservatism.—*English summary.*

2321. Chlewiński, Zdzisław. [Three models of concept identification.] (Polh) *Roczniki Filozoficzne: Annales de Philosophie*, 1972, Vol 20(4), 85-100.—Presents basic information regarding the 3 most recent mathematical models of concept identification: (a) the model of conditioning and adaptation developed by L. E. Bourne and F. Restle, (b) the model of selection and strategy by F. Restle, and (c) the model of selecting hypotheses and conditioning by G. H. Bower and T. Trabasso. (19 ref)

2322. Coleman, Edmund B. & Miller, Gerald R. (U Texas, El Paso) **The simplest experimental design that permits multiple generalization.** *Journal of Reading Behavior*, 1974(Apr), Vol 6(1), 31-40.—Several methodological critiques have pointed out that most experiments in verbal learning fail to present statistical evidence that their results could be replicated using a different sample of language materials. Consequently, many of the studies have little scientific point because their conclusions have to be restricted to the specific language items used in the experiment. All these critiques are summarized, the various solutions to the problem are evaluated, and procedures to arrive at the simplest solution are described. This solution should present no difficulties to anyone who has had a course in analysis of variance. (17 ref)—*Journal abstract.*

2323. de Jorio, Lucio & Rossi, Serena. (U Urbino, Inst of Psychology, Italy) **Effects of frequency and the schedule of reinforcement on measures of learning.** [Ital] *Rivista di Psicologia*, 1972(Jan), Vol 66(1-2), 107-118.—Randomly assigned 41 male and 49 female high school students 13-15 yrs old to 5 experimental groups, homogeneous as to intelligence and personality. Ss were given a task requiring the evaluation of plane geometric figures. It was hypothesized, on the basis of Skinner's theory, that the capacity to give correct judgments depends on the frequency and the schedule of reinforcement. The 5 experimental groups received reinforcement on 100% of the occasions, on 50% and 25% of the occasions in a regularly alternating pattern, on 25% of the occasions randomly selected or not at all (control group). Results show that, as previously reported in the literature, reinforcement is more effective when it is less frequent and more irregular, since it is thus less predictable by the Ss. (20 ref)—*English summary.*

2324. Duncan, Carl P. (Northwestern U) **Word frequency in problem solving.** *Bulletin of the Psychonomic Society*, 1974(Aug), Vol 4(2-A), 93-94.—In a modification of an earlier study by N. H. Jurca and C. P. Duncan (see PA, Vol 43:12160), 60 Ss were presented with problems consisting of 5 words varying in printed language frequency. In different groups, Ss tried to guess the word at a particular frequency level in each problem. The words used within a problem were structurally more similar to each other than had been the case in the previous study. The result was that the word-frequency dimension emerged even more clearly as a habit strength variable in problem-solving.—*Journal abstract.*

2325. Einhorn, Hillel J. (U Chicago, Graduate School of Business) **Cue definition and residual judgment.** *Organizational Behavior & Human Performance*, 1974(Aug), Vol 12(1), 30-49.—Examines the problem in naturalistic studies of whether the residual portion of judgment has functional value (i.e., whether it adds to the clinician's predictive efficiency). Cue definition is shown to be related to the "bootstrapping" phenomenon, and conditions are delineated where bootstrapping will work. The issue depends on the correlation of the residual and the criterion. Furthermore, psychological achievement is a weighted sum of the modeled and residual parts of judgment where the weight parameters are interpreted as environmental complexity. The present 2 naturalistic studies with 29 clinicians and 3 pathologists, respectively, as Ss investigated the residual contribution to achievement. Results show that the residual entered into achievement most prominently in situations where the model of man was poor. For certain cases the residual correlated higher with the criterion than either the model of the man or the global judgment. (28 ref)—*Journal abstract.*

2326. Ellis, Henry C. & Shaffer, Ronald W. (U New Mexico) **Stimulus encoding and the transfer of stimulus differentiation.** *Journal of Verbal Learning & Verbal Behavior*, 1974(Aug), Vol 13(4), 393-400.—3 experiments with a total of 128 Ss investigated the transfer of stimulus differentiation in an A-B, A-D paradigm using trigram, random shape, and letter-matrix stimuli, respectively. Consistent with previous findings, no transfer of differentiation in the form of a paradigm by stimulus

similarity interaction was obtained with trigram stimuli. In contrast, transfer of differentiation was obtained in accord with the classic hypothesis using shapes and letter matrices. The transfer results are interpreted in terms of an encoding stability hypothesis. (18 ref)—*Journal abstract*.

2327. Gilhooly, K. J. & Falconer, W. A. (U Aberdeen, Scotland) **Concrete and abstract terms and relations in testing a rule.** *Quarterly Journal of Experimental Psychology*, 1974(Aug), Vol 26(3), 355-359.—Tested each of 200 undergraduates in 4 experimental groups. Ss had more difficulty in correctly testing a conditional rule stated in abstract form than the same rule given in "thematic" form. The thematic form of the rule involved both concrete terms and a concrete relation. 4 conditions were formed by combining concrete and abstract terms and relations. Results indicate that concreteness of the terms was the main factor leading to improved performance with thematic, as compared with abstract, material in the rule testing task.—*Journal abstract*.

2328. Ingison, Linda J. (U Wisconsin, Madison) **Effects of attribute identification training on rule effects in an attribute identification transfer task.** *Bulletin of the Psychonomic Society*, 1974(Aug), Vol 4(2-B), 133-134.—Tested the hypothesis that attribute identification (AI) pretraining would reduce or eliminate rule effects in AI tasks. 36 12th graders were given 0, 4, or 8 AI problems based on the same rule prior to transfer to a final AI problem. Results indicate that familiarity with AI problems was not a key factor in eliminating rule effects in transfer. Implications for a 2-component model of concept learning are discussed.—*Journal abstract*.

2329. Janssen, Wiel H. & Nodine, Calvin F. (Inst for Perception TNO, Soesterberg, Netherlands) **Eye movements and visual imagery in free recall.** *Acta Psychologica*, 1974(Aug), Vol 38(4), 267-276.—Notes that the relationship between eye movements and visual imagery has almost exclusively been studied by treating eye movements as the dependent variable while an imagery task is being performed. In the present experiment with 18 college students, 3 within-S eye-movement treatment conditions were manipulated as the independent variable to study their effects on the free recall of nouns which Ss had to store by means of imagery. The imagery-evoking capacity (I) of nouns was varied over 3 levels within lists of Dutch nouns (low, medium, and high I). Ss were instructed to generate a visual image to each separate noun under each of the following treatment conditions: (a) while they looked over and scanned their image as if they were looking at the real object, (b) while they received concurrent visual stimulation from a checkerboard pattern, and (c) while they fixated on a target. Reliable, but minor effects of treatment conditions on the recall scores were found. Results are discussed in the terms of possible theories about the nature of the relationship between eye movements and visual imagery. (16 ref)—*Journal abstract*.

2330. Kajita, Masami. [Experimental study on the mediational processes in discrimination shift learning: An alternative view.] (Japn) *Japanese Journal of Educational Psychology*, 1972(Sep), Vol 20(3), 137-146.—Tested an alternative model of mediation and its relevant stimulus dimension which is based on set theory, as

contrasted with T. S. Kendler and H. H. Kendler's (1959) emphasis on the verbal mediational process. 30 college students learned pairs of Japanese nonsense bigrams and single-digit numbers. Ss were assigned to 3 groups which were exposed to 3 different learning conditions: reversal shift, nonreversal shift, and the control task. After completion of the learning tasks, E questioned Ss as to what learning strategies they used. Results indicate that the model, which involves unrelated stimuli and logical mediation, can also be applied to rapid reversal shift. (English summary) (22 ref)—s. Choe.

2331. Kauffman, Dan; Johnson, Mike & Knight, Gene. (Arizona State U) **The empirical derivation of equations for predicting subjective textual information.** *US AFHRL Technical Report*, 1974(Jul), No 74-55, 38 p.—Derives an equation for predicting the subjective textual information contained in a text of material written in the English language. Specifically, this investigation describes, by a mathematical equation, the relationship between the subjective information content of written textual material and the relative number of errors committed by a learner when asked to predict, letter by letter, the content of given textual material. This relationship shows that the subjective information of a given text for a specific learner is directly proportional to the number of wrongly guessed signs made by that learner. The application of C. Shannon's guessing procedure (1951) in this study permits the measurement of the subjective information of a given text for a specific learner. The derived equation permits the measurement of information in terms of a value that is dependent not only upon the inherent qualities of the subject matter, but also upon the internal state of the learner. (16 ref)—*Journal abstract*.

2332. Klemp, George O. (Yale U) **The influence of selected verb characteristics on the acceptance of generic assertions.** *Journal of Verbal Learning & Verbal Behavior*, 1974(Aug), Vol 13(4), 355-364.—R. P. Abelson and his associates (1965, 1966) have shown that the tendency of people to agree with generalizations is dependent upon the verbs employed rather than the subjects or objects of assertions. The present 2 experiments investigated the effects on generalization power (probability of generic agreement) of a total of 77 undergraduates of selected inherent and transfer features of 32 subjective-state verbs. Generic assertions, based on inductive and deductive evidence providing varying degrees of support, were presented to Ss for their acceptance or rejection. Results show that generalization power was influenced primarily by inherent verb characteristics. The notion that transfer features depend on assertion-related evidence for their effect was substantiated, while an implicit-quantifier interpretation of the findings was rejected. (19 ref)—*Journal abstract*.

2333. Kobayashi, Eva L. & Cantor, Joan H. (U Iowa, Inst of Child Behavior & Development) **The effects of dimensional naming upon children's performance in a modified optional shift problem.** *Memory & Cognition*, 1974(Jul), Vol 2(3), 401-405.—Administered shift and test tasks concurrently to 120 2nd graders. Those Ss required, during shift learning, to verbalize the values of the previously relevant dimension showed an increase in reversal responding in the test task, whereas those

required to verbalize the values of the previously irrelevant dimension showed an increase in nonreversal responding. Results are in good agreement with predictions made from an extension of Hull-Spence discrimination learning theory. (15 ref)—*Journal abstract*.

2334. Koenig, Karl P. & Henriksen, Kermit. (U New Mexico) **Cognitive manipulation of GSR extinction: Analogues for conditioning therapies.** In H. London & R. E. Nisbett (Eds), *Thought and feeling: Cognitive alteration of feeling states*. Chicago, IL: Aldine, 1974. 239 p. \$8.95.—Data from 70 undergraduates show that (a) conditioned galvanic skin responses (GSRs) extinguished rapidly when Ss were informed that the unconditioned stimulus would not be administered again and (b) high false feedback about S's responsivity to the conditioned stimulus during extinction maintained a higher level of GSR activity than did low false feedback. (17 ref)

2335. Kramar, M. [Aspects of critical thinking in pupils of grades I-IV.] (Romn) *Studia Universitatis Babes-Bolyai*, 1972, Vol 17, 63-70.—Studied children's critical thinking as applied to solving arithmetical problems. Ss were given problems with incomplete data, problems without a stated requirement, and problems containing redundant data. Critical thinking was shown most often by calling attention to the presence of redundant data, less often by noticing the lack of sufficient data. Noncritical thinking was most often observed as lack of awareness of redundant or incomplete data. (Russian & English summaries)—R. A. Meyer.

2336. Kuhara, Keiko. [Equivalence in verbatim memory: II. Learning of German words using English words as standard.] (Japn) *Japanese Journal of Educational Psychology*, 1972(Sep), Vol 20(3), 155-161.—4 groups of 60 college Ss who were familiar with English but had no previous knowledge of German were exposed for 3 10-sec periods to lists of Japanese-German word pairs, and tested afterward. Rules of consonant correspondence between English and German were given to the 1st 3 groups at different times between or after the 1st and 3rd presentation; the 4th group did not receive rules. Results of a retest indicate that rules given immediately before testing increased memory; however, instruction between the learning exposures facilitated the transfer effect on learning new words. (English summary)—S. Choe.

2337. Legrenzi, Paolo. (Higher Inst of Social Science, Lab of Psychology, Trento, Italy) [Recent research on the psychology of deductive reasoning.] (Ital) *Rivista di Psicologia*, 1972(Jan), Vol 66(1-2), 67-106.—Reviews findings on deductive reasoning arising from the experimental situation, "if . . . then" (e.g., "if p is on one side then q is on the other"; "if p, then no q"; "if no p, then . . ."; etc). 2 schematic models represent (a) J. Piaget's sequential strategies for deductive reasoning and (b) the strategies of "natural thought" (problem solving) developed by P. N. Johnson-Laird and P. C. Wason. It is suggested that the 2 models may be complementary, the former describing thought processes in concrete, familiar circumstances and the latter, thought processes in abstract, unfamiliar material. (79 ref)—J. W. Black.

2338. Levin, Irwin P. (U Iowa) **Averaging processes and intuitive statistical judgments.** *Organizational Be-*

*havior & Human Performance*, 1974(Aug), Vol 12(1), 83-91.—Required undergraduates to make numerical judgments based on a brief inspection of a pair of samples of IQ scores. In Exp I each sample within a pair contained 20 scores, and the values of the 2 sample means were varied factorially. Each of 25 Ss was to infer the mean IQ of the school from which the samples were taken. In Exp II sample size was varied within a pair of samples. In 1 group each of 25 Ss was to infer the mean IQ of the entire school. In another group, 25 Ss judged the mean IQ if the 2 samples were combined into a single sample. The data of Exp I were in agreement with a model that assumes that the judgment of population mean is a simple average of the subjective values of the sample means. The data of Exp II could be described by a weighted average model where sample means are differentially weighted as a direct function of sample size.—*Journal abstract*.

2339. Levin, Joel R. & Divine-Hawkins, Patricia. (U Wisconsin, Madison) **Visual imagery as a prose-learning process.** *Journal of Reading Behavior*, 1974(Apr), Vol 6(1), 23-30.—Examined the effects of visual imagery on recall of short passages. 48 4th graders served as Ss in Exp I and 112 5th graders in Exp II. Experimental conditions were (a) reading or listening to a passage and (b) receiving or not receiving instructions for imagery. Except for differences in rate of presentation, procedures were the same in both experiments. Results indicate that the effect of imagery instruction in recall was statistically greater under listening than under reading conditions. Several interpretations of the findings are presented. (16 ref)—W. L. Chovan.

2340. London, Perry; Cooper, Leslie M. & Engstrom, David R. (U Southern California) **Increasing hypnotic susceptibility by brain wave feedback.** *Journal of Abnormal Psychology*, 1974(Oct), Vol 83(5), 554-560.—Presents a reanalysis of earlier studies by D. R. Engstrom et al (1970) as well as additional findings which show that successful training to increase alpha rhythm duration raises people's hypnotic susceptibility. Ss in the previous studies were 30 volunteers who had low to moderate hypnotic susceptibility and low alpha production. It was found, subsequent to publication, that some Ss had had previous exposure to alpha training. When they were eliminated in reanalysis, the previous findings were still confirmed; alpha training was more effective for experimental than for control Ss, and hypnotic susceptibility accordingly increased more among experimentals than among controls. In addition, base-rate alpha production in each training session was correlated with feedback alpha output among experimental Ss but not among controls. (24 ref)—*Journal abstract*.

2341. Manning, Susan K. & Clark, Elisabeth O. (Hunter Coll, City U New York) **Response effects of equated values of event frequency, repetition, and alternation in one- and two-cue probability learning.** *Quarterly Journal of Experimental Psychology*, 1974(Aug), Vol 26(3), 417-424.—An experiment using 50 college students equated cue values of frequency, repetition, and alternation in 1- and 2-cue partially random sequences in order to determine whether the cues were responded to independently or in combination and to test earlier

results concerning cue saliency. Using improved methods of data analysis, previous findings that repetition is more salient than frequency and frequency more salient than alternation were replicated. In spite of the saliency differences, the design employed demonstrated that both cues in 2-cue sequences were responded to and that responses to 1-cue appeared to be independent of responses to the other.—*Journal abstract.*

2342. Matsuda, Michihiko & Matsuda, Fumiko. [The effects of verbal reinforcement combinations on three-alternative discrimination learning and extinction in infants and the analysis of error factors.] (Japn) *Japanese Journal of Educational Psychology*, 1972(Sep), Vol 20(3), 147-154.—60 kindergartners responded to 3-alternative learning tasks in which color, shape, and position were randomly combined. E gave 3 different verbal reinforcement combinations: right-wrong, right-silence(wrong), and silence(right)-wrong. Results indicate that the right-wrong combination was the most effective, and that alternation with respect to position was the strongest error factor. (English summary)—S. Choe.

2343. Mazzocco, Alberto. (Higher Inst of Social Science, Lab of Psychology, Trento, Italy) [Two experiments on deductive reasoning: The problem of the converse.] (Ital) *Rivista di Psicologia*, 1972(Jan), Vol 66(1-2), 47-65.—Tested the ability of university students to distinguish between a positive statement and its converse. 50 different Ss participated in each experiment, 25 following the positive statement (controls), and 25 the experimental. No student had studied logical calculus. Each experiment contained 3 phases: (a) both red boxes contained marbles (no white box); (b) 1 red box contained a marble (no white box); (c) 1 white box contained a marble. The statement was: "All the red boxes contain marbles." The required reasoning was "all a's are b's" and the converse. The task was "true or false." Ss were shown guiding situations and asked to apply the reasoning. Exp II was similar but used 4 cards, 2 of each central figure and 2 of each border. The instructions called for the reasoning "if p, then q" and the converse. The converse of the statements were the more difficult for the students when responding to the same instructions that accompanied the affirmative statements. Exp II was more difficult than Exp I. (26 ref)—J. W. Black.

2344. McConkie, George W. & Rayner, Keith. (Cornell U) *Investigation of reading strategies: I. Manipulating strategies through payoff conditions.* *Journal of Reading Behavior*, 1974(Apr), Vol 6(1), 9-18.—Studied the effects of reading strategies and payoff conditions or reward systems on reading rate and retention. 70 undergraduates served as Ss. Passages extracted from *Scientific American* were used to test performance under 4 conditions: (a) information about payoff, (b) type of payoff, (c) specificity of instructions, and (d) presence or absence of test questions. Results indicate that the conditions primarily affected reading rates. Applications of payoff conditions for future study of reading strategies are presented.—W. L. Chovan.

2345. Mendelsohn, Gerald A. & O'Brien, Anne T. (U California, Inst of Personality Assessment & Research, Berkeley) *The solution of anagrams: A reexamination of*

*the effects of transition letter probabilities, letter moves, and word frequency on anagram difficulty.* *Memory & Cognition*, 1974(Jul), Vol 2(3), 566-574.—Related word frequency (WR), number of letter moves, and solution word transition letter probabilities (TP) to anagram solution by 60 undergraduate Ss. The solution word TP measure was based on the relative frequencies of correct to incorrect bigrams within the pool of bigrams defined by the letters of the anagram rather than on the absolute frequencies of the correct bigrams. This bigram rank measure, which also took word length and letter position into account, was a powerful predictor of anagram difficulty ( $p < .001$ ). Number of letter moves predicted anagram solution strongly ( $p < .001$ ), but WF was only a marginal predictor ( $.05 < p < .10$ ). There were no significant interactions among the 3 variables, nor was anagram TP consistently related to anagram difficulty. Results are interpreted in terms of an approach which combined elements of an hypothesis and a stimulus-response mediational theory. (24 ref)—*Journal abstract.*

2346. Meyers, Lawrence S.; Gilman, Dennis & Halpern, Joseph. (California State U, Sacramento) *Small-trials partial reinforcement effects in humans: The role of sequential variables.* *American Journal of Psychology*, 1973(Dec), Vol 86(4), 729-737. Conducted 2 experiments with a total of 104 undergraduates. The acquisition sequences in Exp I combined light-off (-) trials with either 46 or 71% light-on (+) trials; those in Exp II had either 2 or 4 - transitions, or run lengths of the - event of 1, 2, or 3. Extinction, administered after very limited acquisition training, consisted of only trials. It was found that resistance to extinction increased as a direct function of the number of + transitions and the length of the run of - trials.—*Journal abstract.*

2347. Moffat, Gene H. & McGown, William. (U Southern Mississippi) *Effect of three extinction procedures following avoidance conditioning in preschool children.* *Bulletin of the Psychonomic Society*, 1974(Aug), Vol 4(2-B), 116-118.—Following acquisition of an instrumental avoidance response, 36 preschool children were given 200 extinction trials. Omission of children's songs served as the aversive event. 3 extinction procedures were established: (a) a conditioned stimulus (CS) only procedure in which the music was never omitted, (b) a punishment procedure in which music omission was response contingent, and (c) a procedure whereby music omission was unavoidable and inescapable. Results are dependent upon the extinction procedures being compared; however, the CS-only procedure was most resistant to extinction.—*Journal abstract.*

2348. Mueller, John H.; Kanak, N. Jack & Flanagan, John L. (U Missouri, Columbia) *The strength of implicit associative responses in verbal-discrimination learning.* *American Journal of Psychology*, 1973(Dec), Vol 86(4), 777-784.—Manipulated the strength of implicit associative responses in the right and wrong terms of verbal-discrimination lists given to 48 undergraduates. The frequency-theory predictions for these manipulations were not supported, despite the presence of false recognitions in a subsequent recognition test. In view of these and earlier equivocal results, it is suggested that implicit associative responses contribute to situational

experience less than other frequency units.—*Journal abstract.*

2349. Ney, Richard C. & Solso, Robert L. (Loyola U, Chicago) **Associative symmetry as measured in the B-Ar paradigm: A stage analysis.** *Bulletin of the Psychonomic Society*, 1974(Aug), Vol 4(2-B), 139-140.—Studied the principle of associative symmetry by using the indirect measure of the B-Ar transfer paradigm. 60 undergraduates were randomly assigned to 3 paradigmatic conditions (C-D, A-Br, or B-Ar). Results indicate that bidirectional learning may be asymmetrical when the learning is viewed in stages.

2350. Oleron, G. & Nosjean, M. (École Pratique des Hautes Études, Lab of Experimental Psychology, Paris, France) **[Effect of vocalization on mnemonic encoding.]** (Fren) *Psychologie Française*, 1972(Jun), Vol 1(1-2), 11-21.—Studied the processes of encoding vocal elements (vowels and consonants) into more complex units (words) when the rules of transformation are known by the S. The hypotheses were that (a) the vocal articulation of each element interferes with the central processes of control and thus delays production of the complex unit, and (b) delays will be longer for more complex coding rules. The 3 coding rules were (a) to maintain the order of presentation (simple rule), (b) to exchange the 1st with the 2nd vowel, and (c) to exchange the 1st with the 2nd consonant (complex rules). Ss were 12 male and female students. Each was presented with all the tasks in a counterbalanced order. Results did not support the hypotheses. Under simple coding rules, it was the order of the tasks which had a significant effect: the 1st tasks given to S (to vocalize or not to vocalize) produced the shortest reaction times. Under complex coding rules, vocalization produced significantly better results than the lack of it, but only when the 1st task was to vocalize.—A. Blasi.

2351. Olson, James N. & MacKay, Donald G. (U Texas Permian Basin, Odessa) **Completion and verification of ambiguous sentences.** *Journal of Verbal Learning & Verbal Behavior*, 1974(Aug), Vol 13(4), 457-470.—Cites alternative models which have been offered to explain the mechanisms underlying the processing of ambiguous sentences. One model contends that the meanings of an ambiguity are processed one at a time, without interaction between them. A rival model contends that to some extent both meanings of an ambiguity can be processed simultaneously, competing with one another until one is perceived. The present 2 experiments with a total of 69 university students tested these theories by systematically varying the probability that a given meaning of an ambiguous sentence will be perceived, and measuring the time to complete or verify the sentences. Results question the adequacy of the noninteraction model and suggest that parallel processing and reciprocal interactions at the semantic feature level are important psychological processes underlying the comprehension of ambiguous sentences.—*Journal abstract.*

2352. Osborne, Bruce; Roach, Tom; Gendreau, Lorna & Gendreau, Paul. (Trent U, Peterborough, Ontario, Canada) **An electrode hookup for eyelid conditioning.** *Behavior Research Methods & Instrumentation*, 1974(Jul), Vol 6(4), 416-418.

2353. Payne, R. B. & Richardson, E. T. (U Georgia) **Control of supplementary feedback cue properties by differentiation and extinction procedures.** *Bulletin of the Psychonomic Society*, 1974(Aug), Vol 4(2-A), 100-102.—Previous studies have suggested that classically pre-differentiated supplementary feedback cues promote psychomotor learning through the operation of conditional properties. The present study with 88 right-handed female undergraduates examined whether such effects could be nullified by conventional extinction procedures. After preliminary tracking practice under common conditions, Ss were assigned in equal numbers to the following conditions: (a) aversive differentiation of to-become supplementary error (positive conditioned stimulus—CS+ and targeting (CS-) cues, (b) differentiation followed immediately by extinction trials, (c) CS-only controls, and (d) neutral controls. Subsequently, all groups tracked under common conditions of cue availability and withdrawal. Once again, predifferentiation transformed otherwise ineffective cues into significant learning supports. Contrary to expectation, however, extinction trials failed to nullify their effects on performance. This failure was rationalized in terms of the known resistance of aversive conditioned responses to extinction and/or possible reconditioning of the cues during the tracking trials.—*Journal abstract.*

2354. Peters, Joan T.; Hammond, Kenneth R. & Summers, David A. (U Colorado) **A note on intuitive vs analytic thinking.** *Organizational Behavior & Human Performance*, 1974(Aug), Vol 12(1), 125-131.—Investigated E. Brunswik's 1956 propositions concerning intuitive vs analytic thinking by assessing performance of 45 young adult Ss in a 3-cue inference task presented in 1 of 3 ways. In Condition 1, cues were presented only as points on a blank, 2-dimensional field, thus encouraging an intuitive, or perceptual, mode of thinking. In Condition 2, Ss were given only the numerical equivalents of the 3 cues. In Condition 3, the cues were presented both perceptually and numerically. The resulting error distributions are consistent with Brunswik's theoretical propositions.—*Journal abstract.*

2355. Peterson, Christopher & Rubel, Carol. (U Colorado) **Associability and anagram solution.** *Bulletin of the Psychonomic Society*, 1974(Aug), Vol 4(2-A), 83-84.—10 undergraduates solved 11 word anagrams that had been scaled for associability. Partialling out the effect of solution associability, solution time and anagram associability were negatively correlated. Partialling out the effect of anagram associability, solution time and solution associability were positively correlated. These results were replicated in a 2nd experiment in which 10 additional undergraduates solved the 11 word anagrams in the opposite direction. It is concluded that associability mediates the ease with which a solver breaks down a given anagram and conversely, the difficulty with which a solver finds a given solution. (15 ref)—*Journal abstract.*

2356. Richardson, Jack. (State U New York, Binghamton) **Stimulus selection and the number of stimulus components.** *Memory & Cognition*, 1974(Jul), Vol 2(3), 463-466.—Conducted 2 experiments with a total of 264 college students in which the number of word components in the compound stimuli of paired-associate lists were varied, and the words within a compound were

presented either in a constant or in a variable order from trial to trial. The number of components, above one, had no appreciable effect on the difficulty of learning, and the variable-order lists were more difficult than the constant-order. Recall with the word components as cues showed that the amount of selection decreased with the variable-order lists as the number of components increased. With the constant-order lists, selection tended to remain constant as number of components increased. This is interpreted as the result of the availability of a rule for selection in the constant order conditions. —*Journal abstract.*

2357. Rothkopf, Ernst Z. (Bell Lab, Murray Hill, NJ) **Barbarism and mathemagenic activities: Comments on criticism by Carver.** *Journal of Reading Behavior*, 1974(Apr), Vol 6(1), 3-8.—Analyzes and rejects Carver's recent objections to the concept of mathemagenic activities. Flaws in Carver's arguments, both logical and empirical, are pointed out. Comments are focused on Carver's remarks about the relationship between mathemagenic activities and reading time, his concept of current theoretical possibilities, and his esthetic of language. (20 ref)—*Journal abstract.*

2358. Rychlak, Joseph F.; Carlsen, Nancy L. & Dunning, Larry P. (Purdue U) **Personal adjustment and the free recall of materials with affectively positive or negative meaningfulness.** *Journal of Abnormal Psychology*, 1974(Oct), Vol 83(5), 480-487.—Conducted 2 experiments on the role of affective assessment in human verbal learning. In Exp I, 40 high school students grouped according to Tennessee Self-Concept Scale scores were given consonant-vowel-consonant trigrams as learnable items. Ss with high self-concepts learned the trigrams they liked more rapidly than disliked trigrams. Ss with low self-concepts reversed this customary pattern and learned disliked trigrams more rapidly than liked trigrams. In Exp II, 64 undergraduates who had completed the Barron Ego-Strength scale were given real words as learnable materials. Results showed that it was possible for the same S to learn certain words along a negative and other words along a positive reinforcement-value sequence. This depended upon whether the word meanings involved reflected a problem area or an area of competence for the Ss being studied. (34 ref)—*Journal abstract.*

2359. Salatas, Harriet & Bourne, L. E. (U Colorado) **Learning conceptual rules: III. Processes contributing to rule difficulty.** *Memory & Cognition*, 1974(Jul), Vol 2(3), 549-553.—Compared 8 unique bidimensional conceptual rule forms in a rule-learning paradigm. Ss were 96 college students. It was predicted that rule difficulty order and error distributions across stimulus class defined by a truth table would be a function of Ss' preexperimental experience predominantly with conjunctive concepts. The hypothesis stated specifically that loci of difficulty with rules derive from (a) assignment of TT of stimuli (those with both relevant attributes) to the negative category, (b) assignment of FF stimuli (those with neither relevant attribute) to the positive category, and (c) assignment of TT and FF stimuli to the same category. The main effects of rule and truth table class were and the interaction of rule and truth table class were statistically significant. Results confirm all predictions

about rule order and error distributions.—*Journal abstract.*

2360. Sanford, A. J. & Seymour, P. H. (U Dundee, Scotland) **The influence of response compatibility on a semantic classification task.** *Acta Psychologica*, 1974(Oct), Vol 38(5), 405-412.—56 students had to decide whether or not a target word was a member of a prespecified semantic category. Poorly representative, or low conjoint frequency (LCF), exemplars were accepted less rapidly than representative, or high conjoint frequency (HCF), exemplars. This effect was considerably enhanced by requiring an incompatible response in which the Ss were asked to say "No" when the target was a member of the category. Results show that the category membership judgment is a natural affirmative, and that the semantic distance effect of conjoint frequency has a magnitude dependent upon the processing demands of the task in which it is measured. Results are discussed in relation to theories of the mechanisms of category membership judgments. It is suggested that the influence of compatibility may be in load-sharing between activation of a response rule and the judgment task per se. (17 ref)—*Journal abstract.*

2361. Smith, Donald B. & Noland, J. Dennis. (Ohio State U) **Reversal and extradimensional shifts with continuous and discontinuous stimulus dimensions.** *American Journal of Psychology*, 1973(Dec), Vol 86(4), 757-768.—32 junior high and 32 college students learned discriminations based on continuous (weight-length) or discontinuous (color-form) dimensions; they then learned reversal and intradimensional and/or extradimensional shifts in an experimentally varied order. Both reversal and intradimensional shifts were learned more readily than extradimensional ones, and junior-high students required more training than college students. Neither order of shift, type of stimulus, nor any interactions were significant. (21 ref)—*Journal abstract.*

2362. Steinmann, Derick O. (U Colorado, Inst of Behavioral Science) **Transfer of lens model training.** *Organizational Behavior & Human Performance*, 1974(Aug), Vol 12(1), 1-16.—Assessed the effects of training on the ability to learn probabilistic cue-criterion relationships as a function of differential feedback and previous tasks. 4 paid female undergraduates received outcome feedback (the correct answer), 4 others received feedforward (statistical information about the task), and 8 more received lens model feedback (statistical information about the task and statistical information about performance). Compared with outcome feedback, both feedforward and lens model feedback led to increases in the consistency and knowledge components of accuracy. There was no systematic effect of the 8 different tasks on increased effectiveness of feedforward or lens model feedback. Judges who received lens model feedback subsequently used outcome feedback more effectively. The effects of previous tasks on accuracy were due to increases in consistency, and not knowledge. (20 ref)—*Journal abstract.*

2363. Vezin, Liliane & Radiguet, Chantal. (U Paris VIII, France) **[Effect of concrete examples on the assimilation of scientific knowledge.]** (Fren) *Psychologie Française*, 1972(Jun), Vol 1(1-2), 61-70.—Investigated the role of differently structured examples in the learning

of abstract concepts. 2 types of examples were considered: homologous examples, illustrating only the fundamental properties of a definition; and examples transformed by extension, i.e., containing details which were unrelated to the essence of a concept. Dependent variables were the ability to apply the concept to a similar context and the ability to transfer it to a different context. 48 boys about 12 yrs old were divided into 3 groups and were taught Archimedes' law under 3 experimental conditions: without examples (Group 1), with homologous examples (Group 2), or with extended examples (Group 3). Application of the learning (to a liquid context) and transfer of learning (to a gas context) were tested. Results show that the performance of both experimental groups was significantly superior to that of Group 1, the controls ( $p < .001$ ). Group 3 was superior to Group 2 in the application task ( $p < .001$ ), but inferior in the transfer task ( $p < .01$ ).—A. Blasi.

2364. White, Richard T. (Monash U, Clayton, Vic, Australia) **The validation of a learning hierarchy.** *American Educational Research Journal*, 1974(Spr), Vol 11(2), 121-136.—Describes 9 stages in the validation of a learning hierarchy. The stages, an amendment to previous methods of validation, lead to strong evidence in support of F. Gagné's postulate that generalized intellectual skills are learned hierarchically while specific individual facts, termed verbalized knowledge, are not. (20 ref)

2365. Williams, Richard L. & Moffat, Gene H. (U Southern Mississippi) **Escapable/inescapable pretraining and subsequent avoidance performance in human subjects.** *Bulletin of the Psychonomic Society*, 1974(Aug), Vol 4(2-B), 144-146.—Tested 72 undergraduates in an escape/avoidance task in which omission of entertaining material served as the aversive stimulus event. Prior to these trials, Ss received 0, 15, or 30 escapable trials and either 0 or 100 inescapable trials with the same aversive stimulus. Results indicate that inescapable trials interfered with performance on the escape/avoidance task and that escapable trials negated the interference effect. The pretraining conditions more directly affected escape rather than avoidance performance.—*Journal abstract*.

2366. Wilson, Robert A.; Fuhrer, Marcus J. & Baer, Paul E. (Midwestern U) **Differential conditioning of electrodermal responses: Effects of performing a masking task during the interstimulus and intertrial intervals.** *Biological Psychology*, 1974, Vol 2(1), 33-46.—Assessed differential conditioning of electrodermal responses (EDRs) in 3 groups of male university students ( $n = 29$ ) which were assigned a probability learning procedure as a masking task. One group performed the task during the interstimulus interval, another during the intertrial interval, and a 3rd during both intervals. A 4th group of 15 Ss did not perform the masking task. Consistent with M. J. Fuhrer and P. E. Baer's findings (see PA, Vol 43:15172), inaccurate verbalizers in the group which performed the masking task during the interstimulus interval exhibited reliable differential conditioning of 1st-interval EDRs during the late acquisition trials. Substantial conditioning effects were observed in all groups of accurate verbalizers. Results confirm that differential EDR conditioning can occur without awareness of the stimulus relations, but only

when relatively restricted masking operations are used.—*Journal abstract*.

### Attention & Memory

2367. Anderson, John R. & Bower, Gordon H. (Human Performance Ctr, Ann Arbor, MI) **Interference in memory for multiple contexts.** *Memory & Cognition*, 1974(Jul), Vol 2(3), 509-514. Remembering that an item occurred in several different lists is formulated here in terms of retrieval of corresponding list tags associated to the item. Therefore, associative interference should operate upon remembering the several list contexts in which an item appeared. In 2 experiments a total of 74 paid university students studied 4 (or 5) overlapping lists of 16 words with a given word exemplifying one of the 16 (or 32) possible sequences of appearances and nonappearances over the 4 (or 5) lists. Later, Ss rated from memory for each word and for each list whether that word had occurred in that list. Indices of discriminative memory revealed strong proactive interference and weaker retroactive interference. Discriminative memory that an item occurred in a given list was poorer the more prior or more subsequent the lists in which that item had also occurred. Thus, list differentiation appears explicable in terms of item-specific associative interference.—*Journal abstract*.

2368. Anderson, John R. & Bower, Gordon H. (U Michigan) **A propositional theory of recognition memory.** *Memory & Cognition*, 1974(Jul), Vol 2(3), 406-412.—Modifies J. R. Anderson and G. H. Bower's (see PA, Vol 49:10383) theory of recognition memory for words. A propositional representation is outlined for the contextual information underlying word recognition. Logical arguments are offered for preferring this representation over the undifferentiated associative representation used earlier. The propositional representation is used to interpret effects of verbal context upon recognition memory. Implications of these context effects are considered for 2-process models of recall and recognition. (21 ref)—*Journal abstract*.

2369. Anderson, Richard C. (U Illinois, Training Research Lab) **Substance recall of sentences.** *Quarterly Journal of Experimental Psychology*, 1974(Aug), Vol 26(3), 530-541.—73 high school girls who received either imagery or repetition instructions attempted to recall a once-exposed series of 16 sentences shortly after exposure or 1 day later. Both the absolute and relative frequency with which semantically related words were substituted for the verbatim language of the sentences increased over the retention interval. This fact is explained in terms of transfer from a phonological to a semantic store. Sentences were almost always recalled as a whole if they were recalled at all, which is interpreted as evidence that sentences are learned and recalled as propositions rather than sets of independent associations among words or concepts. (16 ref)—*Journal abstract*.

2370. Bahrack, Harry P. (Ohio Wesleyan U) **The anatomy of free recall.** *Memory & Cognition*, 1974(Jul), Vol 2(3), 484-490.—Inferred the relative importance of various covert cues used in free recall on the basis of conditional probabilities of free recall given success vs failure of cued recall of the same material in a 2-part experiment with a total of 96 undergraduate Ss. 36 names

associated with pictures arranged in a  $6 \times 6$  matrix were learned. A free-recall test of names was followed by cued recall of names, with pictures, positions, or joint pictures and positions used as cues. Matching tests based on these cues were also administered. The tests were given at 1 of 2 stages of training, immediately or after 2 days. Pictorial and position cues were equally well encoded, but pictorial cues were less accessible and, therefore, relatively more useful in cued than in free recall. Position and pictorial information related to the names appeared to be encoded and forgotten independently, and there was no evidence for summation of subthreshold encoding effects.—*Journal abstract.*

2371. Bellezza, Francis S. & Poplawsky, Alex J. (Ohio U) **The function of one-word mediators in the recall of word pairs.** *Memory & Cognition*, 1974(Jul), Vol 2(3), 447-452.—Conducted 2 experiments using cued-recall (Exp I with 32 undergraduates) and free-recall (Exp II with 32 Ss) learning tasks. Ss were requested to add a 1-word mediator to some of the pairs of concrete nouns presented. The mediated pairs were learned better than the control pairs in both tasks. Both words were recalled only when the mediator was also recalled. Also, 1-word mediators were the most effective recall cues and were the best recalled words in free recall. A 2-stage learning model adequately describes the data. However, a counterargument can be made which considers the mediator to be a high associate of one of the words presented and actually has no direct link to the other presented word. A possible experimental resolution of the problem is discussed.—*Journal abstract.*

2372. Brink, John H. (Purdue U) **Impression order effects as a function of the personal relevance of the object of description.** *Memory & Cognition*, 1974(Jul), Vol 2(3), 561-565.—Tested the influence of different target stimuli on impression order effects. 60 undergraduates evaluated bivalent sets of personality-trait adjectives which purportedly described a hypothetical stranger, the E, or the Ss themselves. Under unwarned recall conditions, variations in the object of description significantly influenced impression order effects ( $p < .01$ ). It is suggested that this effect may have been a function of attention decrements and of implicit evaluations associated with various levels of personal relevance of the impression formation task. Analyses of adjective recall support the verbal memory hypothesis of impression formation for only the unfavorable-favorable sets in the forewarned recall conditions. Recall analyses, however, suggest the importance of recall measurement criteria used in tests of the verbal memory hypothesis. (24 ref)—*Journal abstract.*

2373. Burrows, David & Okada, Ronald. (State U New York, Brockport) **Scanning temporally structured lists: Evidence for dual retrieval processes.** *Memory & Cognition*, 1974(Jul), Vol 2(3), 441-446.—Presented lists of memory items containing 1 temporal pause to a total of 73 undergraduates. After each list, Ss were asked to classify a test item as positive or negative based on the memory information. In Exps I and II, the test item was to be classified as positive if it occurred in the memory set at all, and mean reaction times for the decision were longer than for a no-pause control. In Exp III a positive response was required provided that the test item was in

a relevant portion of the list as defined by a postlist cue. Reaction times were longer and showed a somewhat different pattern than for a no-pause control. An interpretation is offered based on the hypothetical existence of 2 simultaneously executed serial scans, one "exhaustive" and the other "self-terminating," as defined by S. Sternberg (1966, 1969).—*Journal abstract.*

2374. Carpenter, Patricia A. (Carnegie-Mellon U) **On the comprehension, storage, and retrieval of comparative sentences.** *Journal of Verbal Learning & Verbal Behavior*, 1974(Aug), Vol 13(4), 401-411.—Tested a methodology that permits the separate examination of sentence comprehension processes and subsequent sentence memory processes. 44 undergraduate Ss were timed as they read a comparative sentence like "Giraffes are taller than goats" and decided whether the sentence was true or false. The response latencies indicated that sentences with unmarked adjectives like "taller" or "larger" were verified faster than sentences with marked adjectives like "shorter" or "smaller." A subsequent recall or recognition procedure tested incidental memory for the previously verified sentences. Recall performance was superior for sentences with unmarked adjectives. The similarity between the results of comprehension and recall is discussed in terms of a retrieval process that may be similar in both tasks. This process retrieves the representations of objects from memory and places them appropriately along the dimension on which they are being compared. (21 ref)—*Journal abstract.*

2375. Cohen, David B. & MacNeilage, Peter F. (U Texas, Austin) **A test of the salience hypothesis of dream recall.** *Journal of Consulting & Clinical Psychology*, 1974(Oct), Vol 42(5), 699-703.—Tested the hypothesis that dream salience (subjective impact of the generated dream) would be greater for frequent than infrequent dream recallers. Dream recall data from 8 frequent and 8 infrequent recallers (male undergraduates) were obtained under 2 conditions: tape-recorded verbal reports given to the E after interruption of rapid eye movement (REM) sleep and written diary reports after awakening by alarm clock in the absence of the E. Analysis of the verbal reports confirmed the hypothesis. The relatively greater difference between the 2 groups in mean percentage of dream diary recall for Stage 2 (non rapid eye movement; NREM) than for REM awakenings suggests that salience differences between the 2 groups may be greater following NREM than REM awakenings. Although salience may be affected by dream recall as well as dream generation processes (imagery ability seems related to both), the higher frequency of temporal references to past and future in the dreams of frequent recallers appears to relate to the generation processes alone.—*Journal abstract.*

2376. Corballis, Michael C.; Roldan, Carlos E. & Zbrodoff, Jane. (McGill U, Montreal, Quebec, Canada) **Response set effects in recognition memory.** *Memory & Cognition*, 1974(Jul), Vol 2(3), 501-508.—In 3 experiments with 12 university students in each, Ss responded to individual digits or letters according to whether or not each was in some prememorized list. There were either possible responses (yes-no condition) or a single response (yes-only and no-only conditions). With memorized sets of 1, 2, or 4 digits, reaction time was a linear

function of memory set size. The slope of the function was least under the yes-only condition and greatest under the yes-no condition. With memory sets of 4, 8, or 12 letters, the slopes under the yes-only and yes-no conditions did not seem to differ, and practice with specific sets flattened the function considerably in both cases. Overall, the errors under the yes-no condition were mostly false alarms, those under the no-only condition mostly misses, and those under the yes-no condition were divided about equally. Results are interpreted partially in terms of a multiple-observations model of decision time. (19 ref)—*Journal abstract*.

2377. Derks, Peter L. (Coll of William & Mary) **The length-difficulty relation in immediate serial recall.** *Journal of Verbal Learning & Verbal Behavior*, 1974(Aug), Vol 13(4), 335-354.—6 experiments examined the time a total of 46 graduate and undergraduate students and 52 other Ss spend studying arrays of items before they tried to recall the items in order. Within and across experiments the relation between study time and amount of material to be recalled was most generally a power function with an exponent of approximately 2.6. Thus, arrays doubled in size were studied about 6 times as long. Experimental manipulations and individual differences, however, suggest some limitations on the generality of the power function. The power, logarithmic, and exponential functions observed are suggested as possible indicators of the interaction of associative and organizational processes in serial learning. (45 ref)—*Journal abstract*.

2378. Duffy, Thomas M. & Kearn, David. (US Navy Personnel Research & Development Ctr, San Diego, CA) **Mnemonics and intralist interference: A reexamination.** *American Journal of Psychology*, 1973(Dec), Vol 86(4), 749-755.—120 undergraduates learned a list of nonsense syllables paired with words and presented with a relational, a nonrelational, or no mnemonic. The stimulus syllables formed 3 subgroups of similarity. It was predicted that mnemonics would reduce error responses more to similar than to distinctive stimuli. Results, however, indicate that mnemonics reduced confusions only between distinctive stimuli. Interpretations based on transfer of associative strength and grouping of similar pairs are discussed. (15 ref)—*Journal abstract*.

2379. Duncan, Carl P. (Northwestern U) **Retrieval of low-frequency words from fixed lists.** *Bulletin of the Psychonomic Society*, 1974(Aug), Vol 4(2-B), 137-138.—Presented either a list of high- or a list of low-frequency words (unmixed lists), or lists containing equal numbers of words from the 2 frequency levels (mixed lists) to a total of 248 Ss in 2 experiments. In recall there was a significant Frequency  $\times$  List interaction: in unmixed lists high-frequency words were better recalled; in mixed lists low-frequency words were better recalled.

2380. Flores, Luis M. & Brown, Sam C. (Kansas State U) **Comparison of output order in free recall.** *Behavior Research Methods & Instrumentation*, 1974(Jul), Vol 6(4), 385-388.—Examines 2 measures of output order in free recall and shows them to vary with characteristics of recall unrelated to output order. The output location of a subset of items in recall, using the standard recall rank measure and the "observed minus expected" score, varies

both with number of items in the subset and total number of items recalled. A new measure of output order (the relative index of priority or RIP score) is proposed that is invariant with these characteristics of recall, providing an uncontaminated empirical index of the output location of a subset of items in the recall sequence.—*Journal abstract*.

2381. Folkard, Simon & Greeman, Adrian L. (MRC Applied Psychology Unit, U Sussex, Brighton, England) **Salience, induced muscle tension, and the ability to ignore irrelevant information.** *Quarterly Journal of Experimental Psychology*, 1974(Aug), Vol 26(3), 360-367.—Examined the effects of salience and induced muscle tension on 24 adult volunteers (Exp I) and on 16 paid university students (Exp II) in card sorting tasks. Results of Exp I suggest that even though the responses appropriate to the relevant and irrelevant information were unrelated there was an effect of irrelevant information, but only when it was more salient than the relevant information. Induced muscle tension improved performance based on less salient attributes but degraded performance based on more salient attributes. Exp II confirmed this latter finding using a version of the Stroop Color-Word Test. It is tentatively suggested that induced muscle tension may inhibit naming responses. (15 ref)—*Journal abstract*.

2382. Gerver, David. (U Stirling, Scotland) **Simultaneous listening and speaking and retention of prose.** *Quarterly Journal of Experimental Psychology*, 1974(Aug), Vol 26(3), 337-341.—Examined the effects of simultaneous listening and speaking on comprehension and recall, requiring 9 trainee simultaneous interpreters to shadow, listen to, and simultaneously interpret into English 3 French prose passages. Subsequent tests of comprehension and recall showed that higher scores were obtained in the listening condition than in simultaneous interpretation, which in turn yielded significantly higher scores than shadowing.—*Journal abstract*.

2383. Glass, Arnold L. & Holyoak, Keith. (Stanford U) **The effect of some and all on reaction time for semantic decisions.** *Memory & Cognition*, 1974(Jul), Vol 2(3), 436-440.—Tested a model proposed by D. E. Meyer (see PA, Vol 45:7411) to account for the times required to verify semantic-memory statements quantified by *all* or *some*. Each S was presented with both *all* and *some* statements in a mixed list, and the discriminability of false statements of the 2 quantifier types was controlled. In Exp I with 24 female undergraduates positive subset statements were verified more quickly when quantified by *all* rather than *some*; the reverse ordering occurred for negative subset statements. Sentences with pseudowords in subject or predicate position took longer to reject than false real-word sentences. Findings contradict Meyer's theoretical predictions and suggest that his earlier results were artifactual. Exp II with 18 paid undergraduates replicated the faster verification of positive subset statements quantified by *all*. The production frequency of predicates which form subset statements was lower when the quantifier was *some* rather than *all*. Holding predicate production frequency constant, sentences with different quantifiers were verified equally quickly.—*Journal abstract*.

2384. Glass, Arnold L.; Cox, Julia & LeVine, Susan J. (Stanford U) **Distinguishing familiarity from list search responses in a reaction time task.** *Bulletin of the Psychonomic Society*, 1974(Aug). Vol 4(2-A), 105-108. —Tested the claim of the model proposed by R. C. Atkinson and J. F. Juola that recognition responses in a reaction-time (RT) task are a mixture of fast responses on the basis of the item's familiarity and slower responses based on a list search for the item. 24 undergraduates had to learn 2 16-word lists (A and B). Then they had to respond alternately to "Is the following a List A word?" and "Is the following a List B word?" In the control task, the members of one list served as distractors for the other. Hence, the familiarity values of the targets and distractors were equal, and the only basis for response was a list search. In the experimental task, the distractors were not list words. Consequently their familiarity was lower, and familiarity responses could be made. There were no differences between 2 groups of Ss when they all responded in the control task. But when half the Ss were switched to the experimental task, they responded significantly faster than the Ss who continued in the control task. In the experimental task distractors were rejected quicker than targets were identified, but in the control task the reverse was true. Results support the hypothesis that the control task required a list search while a familiarity judgment was possible in the experimental task.—*Journal abstract*.

2385. Gold, Paul E. & King, Richard A. (U California, Irvine) **Retrograde amnesia: Storage failure versus retrieval failure.** *Psychological Review*, 1974(Sep). Vol 81(5), 465-469.—Retrograde amnesia is generally taken as evidence for the disruption of memory storage processes. Recently, R. R. Miller and A. D. Springer (see PA, Vol 50:263) proposed that retrograde amnesia is the result of a (usually) reversible retrieval block and not the result of interference with memory storage processes. "Reminder" studies provide the principal data on which their theory is based. The reminder studies are reviewed, as well as other recent studies which are purported to support the retrieval block hypothesis. It is concluded that the findings of these studies are compatible with storage interpretations of retrograde amnesia and have little bearing on the interpretation of retrograde amnesia. (29 ref)—*Journal abstract*.

2386. Grober, Ellen H. & Loftus, Elizabeth F. (Johns Hopkins U) **Semantic memory: Searching for attributes vs searching for names.** *Memory & Cognition*, 1974(Jul). Vol 2(3), 413-416.—Investigated whether searching for a word that has a particular attribute (a fruit that is yellow) involves a different process than searching for a word whose name has a particular form (a fruit whose name begins with "p"). 20 graduate students saw category nouns paired with adjectives or letter restrictors presented on a series of blocked trials and on a series of mixed trials. Ss had to produce a word that fell in the space defined by the noun and the restricting adjective or letter. Reaction time was fastest when trials were blocked and when a letter followed the presentation of the noun. This finding suggests the existence of 2 retrieval plans that can be executed when S has knowledge of the forthcoming type of item. (20 ref)—*Journal abstract*.

2387. Gruneberg, Michael M. & Monks, Joseph. (University Coll Swansea, Wales) **"Feeling of knowing" and cued recall.** *Acta Psychologica*, 1974(Aug). Vol 38(4), 257-265.—Investigated the relationship between an individual's "feeling of knowing" (FOK) that a memory response is stored and evidence of later retention. Immediately following the presentation of a test list in which 36 undergraduates were required to recall capitals of countries, unretrieved items were subject to a further retrieval attempt. Items still unretrieved were then subject to 1st-letter cuing. Finally, items still unretrieved were subject to 1st- and 2nd-letter cuing. Results indicate that degree of expressed FOK was significantly related to later retrieval following both 1st- and 2nd-letter cuing. This finding thus extends the findings of J. T. Hart (1965) and of J. L. Freedman and T. K. Landauer (1966) concerning the relationship between FOK and later measured retention, as in both these studies retention was measured by a recognition procedure. Where Ss reported "not knowing" a capital on the test list, there was nevertheless a substantial probability of recall following cuing. Wrong responses given during the test list presentation were highly indicative of a correct response following cuing.—*Journal abstract*.

2388. Hall, James W. & Pierce, Jean W. (Northwestern U) **Recognition and recall by children and adults as a function of variations in memory encoding instructions.** *Memory & Cognition*, 1974(Jul). Vol 2(3), 585-590.—Conducted 4 experiments with a total of 96 3rd graders, 102 4th graders, 108 5th graders, and 224 undergraduates. Ss were instructed to learn a set of 40 words by producing implicit associative responses to each item (association instructions), by repeating items over and over (repetition instruction), or by using their own devices (neutral instructions). Exp I showed that recognition memory (RM) accuracy was greatest under association instructions for adults and children and least under repetition instructions for children. Implications of these results for a frequency theory analysis for RM are discussed. Exps II, III, and IV examined free recall (FR) as a function of encoding instructions at short (1-min) and long (either 90-min or 24-hr) retention intervals. FR was worst under repetition instructions, with little overall difference between the association and neutral conditions. However, in Exps III and IV, using children, the neutral condition exceeded the others in FR after 90 min but not after 1 min.—*Journal abstract*.

2389. Hitch, Graham J. (U Stirling, Scotland) **Short-term memory for spatial and temporal information.** *Quarterly Journal of Experimental Psychology*, 1974(Aug). Vol 26(3), 503-513.—Examined the probed recall of visually presented letter sequences in which the items appeared at different spatial locations. 3 types of probe were compared: spatial position, temporal association, and combined position and association. In Exp I with 11 naval ratings, in which the spatial locations of the items were correlated with their temporal order, spatial probes were more effective than temporal association probes. In Exp II with 36 housewives, spatial location was uncorrelated with temporal order, and spatial probes were less effective than temporal association probes. Regardless of the probe, errors tended to be items presented close in time to correct responses. Results are discussed in terms

of a storage system in which items and their spatial locations are organized within a temporal format. Both experiments showed superior combined probe performance, demonstrating that short-term retrieval is not limited to the use of 1 type of cue at a time.—*Journal abstract.*

2390. Holmes, David S. (U Kansas) **Investigations of repression: Differential recall of material experimentally or naturally associated with ego threat.** *Psychological Bulletin*, 1974(Oct), Vol 81(10), 632-653.—Reviews the wide variety of relatively recent research conducted to test predictions derived from the theory of repression. It is found that none of the investigations provided support for the predictions. Changes in recall when threat was experimentally introduced and then eliminated were due to increases and decreases in distraction, and differences in recall of material identified as threatening and nonthreatening by the word association technique could not be used as evidence because threat and association value (which can be related to recall but independent of threat) were confounded in the word association measure. Research employing personally conflictual material or material identified as threatening on the basis of a theory also failed to provide evidence for repression. Theoretical implications and alternative approaches for understanding differential recall in the applied setting are discussed. (64 ref)—*Journal abstract.*

2391. Hopkins, Ronald H. (Washington State U) **Retrieval problems in successive short-term retention trials.** *Journal of Verbal Learning & Verbal Behavior*, 1974(Aug), Vol 13(4), 424-429.—Tested a total of 196 undergraduate Ss in 4 experiments for short-term retention of different triads of month names on 4 successive trials. Results show that (a) though apparently recallable across trials; (b) this decrement in recall was much smaller with 20-sec than with 4-sec periods for recall, and a shift from 4-sec to 20-sec recall periods produced an abrupt improvement in recall performance; (c) response latency for correctly recalled words increased across trials. Results are interpreted as support for the hypothesis that proactive interference in this task is primarily due to retrieval, as opposed to encoding or storage, processes. (16 ref)—*Journal abstract.*

2392. Johnson, Ronald E. (Purdue U) **Learners' predictions of the recallability of prose.** *Journal of Reading Behavior*, 1974(Apr), Vol 6(1), 41-52.—Attempted to determine whether learners of textual prose know which portions of the text are likely to be difficult to recall. For each of 2 textual passages, samples of college students (107 and 114, respectively) were able to predict accurately the prose subunits which were actually recalled by various samples of learners attempting immediate or delayed reproductions. Multiple regression analyses provided evidence that the predictions of recall showed considerable congruence with independent ratings of the meaningfulness and comprehensibility of the subunits.—*Journal abstract.*

2393. Klein, Raymond & Kerr, Beth. (U Oregon) **Visual signal detection and the locus of foreperiod effects.** *Memory & Cognition*, 1974(Jul), Vol 2(3), 431-435.—Determined the effect of alertness on S's sensitivity to external signals by varying the foreperiod in

a visual signal detection task with 5 paid, normally seeing young adults. Discriminability increased with increasing foreperiods up to an optimal foreperiod, beyond which it decreased slightly. This pattern of results parallels closely that of many foreperiod studies in which reaction time was the dependent variable. Because no speeded response was required in this signal detection task, it is concluded that alertness must be affecting an information processing stage prior to those associated with responding. Other evidence indicates that alertness does not affect sensory stages either. Alertness, by elimination, must be affecting the operation of a central stage. The view of alertness of M. I. Posner et al (see PA, Vol 50:6196) which implicates the central stages is discussed. (28 ref)—*Journal abstract.*

2394. Loftus, Elizabeth F.; Wiksten, Sif & Abelson, Robert P. (U Washington) **Using semantic memory to find vs create a mood.** *Memory & Cognition*, 1974(Jul), Vol 2(3), 479-483.—In 3 experiments a total of 52 college students produced words from semantic memory which satisfied certain constraints. In Exp I a noun category plus a number and a letter were presented, and S produced an instance of the category which had the given letter in the position designated by the given number. Faster responses occurred when the position cue occurred before the letter rather than after it. In Exps II and III Ss saw only a number and a letter and were required to produce any word that had the given letter in the position designated by the given number. Order of the position and letter cues did not influence response times. The effect of order in one case and not the other strongly suggests that producing a word that satisfies certain semantic constraints involves a different process from producing a word that satisfies only certain orthographic restrictions.—*Journal abstract.*

2395. Loftus, Geoffrey R. & Loftus, Elizabeth F. (U Washington) **The influence of one memory retrieval on a subsequent memory retrieval.** *Memory & Cognition*, 1974(Jul), Vol 2(3), 467-471.—18 paid adult Ss produced an instance of a category and following zero or 2 intervening items produced a 2nd instance of the same category. Results show that the 2nd instance was produced more quickly than the initial instance. This finding, in conjunction with other data reported in the paper, indicates that the reduction in latency for the 2nd instance is due mostly to a reduction in the rate with which the category is searched.—*Journal abstract.*

2396. Loftus, Geoffrey R. (U Washington) **Acquisition of information from rapidly presented verbal and nonverbal stimuli.** *Memory & Cognition*, 1974(Jul), Vol 2(3), 545-548.—2 experiments with a total of 10 adult Ss tested recognition memory for rapidly presented stimuli. In Exp I, 16 words were presented at exposure times ranging from 25 to 500 msec followed by a yes-no recognition test. Results show a strong dependence of memory performance on both exposure time and serial position. In Exp II, 16 random forms were presented at exposure times ranging from 125 to 2000 msec followed by a yes-no recognition test. Results for random forms show that memory performance was strongly dependent on exposure time but not on serial position. Taken together, the results of Exps I and II suggest qualitative

encoding differences between verbal vs nonverbal stimuli.—*Journal abstract.*

2397. Mark, Richard. (Monash U, Clayton, Vic, Australia) **Memory and nerve cell connections: Criticisms and contributions from developmental neurophysiology.** Oxford, England: Clarendon, 1974. x, 156 p. \$10.95.—Presents a comprehensive review of the literature on mechanisms of electrical signaling in the nerve system, the development and maintenance of brain structure, and the behavioral expression of memory. Experimental data from the fields of neurophysiology, neuroembryology, and learning and memory, and a theory of modifiable brain cell networks are included. (14½ p ref)

2398. Melnick, Gerald I. & Wexler, Harry K. (Yeshiva U) **Two modes of association.** *American Journal of Psychology*, 1973(Dec), Vol 86(4), 845-850.—144 undergraduates were presented unitary or nonunitary stimuli (formed of consonant-vowel-consonants of low and middle association value) and then given recognition or recall tests equated for availability of the stimuli. For both association values, there was a significant interaction between the type of test and the stimulus conditions. The procedures provide a means of experimentally distinguishing unitary and nonunitary forms of association.—*Journal abstract.*

2399. Miller, Ralph R. & Springer, Alan D. (Brooklyn Coll, City U New York) **Implications of recovery from experimental amnesia.** *Psychological Review*, 1974(Sep), Vol 81(5), 470-473.—Examines 2 alternative explanations of experimental amnesia reversal following a noncontingent reminder trial. On the basis of a review of research data, it is concluded that a retrieval failure hypothesis is the more plausible. In either case, both models are predicated on the existence of physiological mechanisms capable of consolidating information in intervals (seconds or fractions of a second) shorter than typical estimates of consolidation times. The generality of retrieval failure as a source of a variety of behavioral deficits is discussed. (15 ref)—*Journal abstract.*

2400. Peterson, Richard G. & McIntyre, Curtis W. (U Minnesota) **The influence of semantic "relatedness" on linguistic integration and retention.** *American Journal of Psychology*, 1973(Dec), Vol 86(4), 697-706.—Manipulated semantic "relatedness" of sentences in an attempt to clarify the relationship between R. N. Shepard's (1967) demonstration of specific recognition memory and J. D. Bransford and J. J. Franks's (1971) integrated recognition memory. Ss were 40 undergraduates. Accurate specific recognition memory for sentences occurred when semantic intersentential relations were not present but virtually disappeared when they were present. (18 ref)—*Journal abstract.*

2401. Ray, Colette. (University Coll, Cardiff, S Wales) **Some components of colour-word interference and their relationship with field dependence.** *Acta Psychologica*, 1974(Aug), Vol 38(4), 323-330.—Hypothesized that a standard color-word interference situation involves a number of distinct factors, each of which contribute to the overall delay. A total of 30 undergraduate and graduate students were given a color-word test and D. N. Jackson's short form of the Embedded Figures Test. Interference was analyzed in terms of the delay associat-

ed with particular characteristics of different interfering stimuli. These measures were found to be unrelated and were thus held to represent distinct components of the interference effect. Field dependence was primarily related to the component which was described as "perceptual distraction."—*Journal abstract.*

2402. Reitman, Judith S. (U Michigan) **Without surreptitious rehearsal, information in short-term memory decays.** *Journal of Verbal Learning & Verbal Behavior*, 1974(Aug), Vol 13(4), 365-377.—Cites J. S. Reitman's (see PA, Vol 46:10198) finding that Ss could retain 3 words perfectly for 15 sec while detecting tones in noise and supposedly avoiding rehearsal. These results were taken to indicate lack of support for the decay principle of short-term memory. The present 2 studies with a total of 52 male paid undergraduates tested 2 assumptions in the Reitman study: that 100% recall reflects not a ceiling effect but the absence of forgetting, and that lack of disruption of interpolated detection performance indicates lack of rehearsal. Major results indicate that (a) the 1971 study did involve a ceiling effect; (b) tonal detection was measurably disrupted when subjects rehearsed; and (c) when Ss detected equally well in the retention interval as in a control interval they forgot 33% of what they could recall immediately, and when they detected syllables instead of tones, they forgot about 44% more. There is clear evidence for both decay and simple interference in short-term memory.—*Journal abstract.*

2403. Richards, Larry G. (U Virginia) **"Vexilver-such" revisited: A reexamination of Goldiamond and Hawkins' experiment.** *American Journal of Psychology*, 1973(Dec), Vol 86(4), 707-715.—Replicated I. Goldiamond and W. F. Hawkins's (see PA, Vol 34:805) experiment on the log relationship between word frequency and recognition, using L. Postman and M. R. Rosenzweig's (1956) dual-modality design. Ss were 20 undergraduates. A postexperimental interview assessed the Ss' perceptions of and reactions to the task. Goldiamond and Hawkins's results were replicated and extended to auditory training and test conditions. However, results of the postexperimental interview call into question the relevance of this type of study to the debate about the source of the standard word-frequency effect.—*Journal abstract.*

2404. Richards, Larry G. (U Virginia) **On perceptual and memory processes in the word-frequency effect.** *American Journal of Psychology*, 1973(Dec), Vol 86(4), 717-728.—Pretrained a total of 30 undergraduate and graduate students on a task involving recognition of artificial words by R. L. Solomon and L. Postman (see PA, Vol 27:4218). Ss were then given both a memory (recall) and a tachistoscopic (recognition) test either immediately, after 1 wk, or both. Recognition and recall both improved with increased pretraining, but this effect on recognition was greatly attenuated after 1 wk. Recognition improved with repeated testing. The number of letters correctly recognized was also analyzed. Findings support a response-bias interpretation of the word-frequency effect in the Solomon and Postman paradigm.—*Journal abstract.*

2405. Rothstein, Lee D. (Stanford U) **A simplified procedure for the study of memory retrieval processes.**

*Bulletin of the Psychonomic Society*, 1974(Aug), Vol 4(2-A), 73-75.—Presents a simplified and inexpensive procedure for the conduct of research on recognition memory retrieval. The procedure is a card sorting analog to S. Sternberg's item recognition task. An experiment is reported with 15 undergraduates which demonstrates the validity of the card sorting task. The suitability of the task for the undergraduate laboratory is discussed. Suggestions are given for how card sorting may be used to study psycholinguistic processing and semantic memory.—*Journal abstract*.

2406. Routh, D. A. & Mayes, J. T. (U Bristol, England) **On consolidation and the potency of delayed stimulus suffixes.** *Quarterly Journal of Experimental Psychology*, 1974(Aug), Vol 26(3), 472-479.—Notes that, in a strictly serial recall task, increasing the temporal separation of a spoken memory list and a spoken distractor (stimulus suffix) reduces the latter's potency as a source of interference. This phenomenon was studied further with 20 university personnel and student volunteers using suffix delays in the range of .8-6.4 sec and a transcription task to minimize rehearsal during the suffix delay. Results indicate that the probability of correct recall from the terminal serial position, of a sequence of 8 digits, is a linearly increasing function of the logarithm of the suffix delay, over the range studied. Results are discussed in terms of their value as evidence for the existence of a consolidation process. (21 ref)—*Journal abstract*.

2407. Runquist, Willard N. (U Alberta, Edmonton, Canada) **The assessment of discriminative encoding in memory for paired associates.** *Memory & Cognition*, 1974(Jul), Vol 2(3), 472-478.—Designed a technique for providing for the measurement of encoding stability and intralist stimulus discrimination. An experiment with 78 undergraduate Ss applied the technique to the analysis of some paired-associate data. Essentially, the measure involved a recall test for all stimuli in the list except one, then presenting either a previously tested stimulus or the missing stimulus. Recognition of repeated stimuli reflected code stability, and recognition of the missing stimulus reflected stimulus discrimination.—*Journal abstract*.

2408. Sales, Bruce D.; Cole, Ronald A. & Haber, Ralph N. (U Nebraska) **Mechanisms of aural encoding: VIII. Phonetic interference and context-sensitive coding in short-term memory.** *Memory & Cognition*, 1974(Jul), Vol 2(3), 596-600.—In previous experiments Ss were presented with sequences of 5 consonant phonemes paired with /a/ in which the middle 3 consonant phonemes shared the same manner of articulation, the same place of articulation, or neither. The middle consonant phoneme was always more difficult to recall in manner of articulation sequences but not in place of articulation sequences. Results suggest that consonant phonemes were not remembered in terms of their place of articulation. In the present experiment, sequences of consonant-vowel (CV) or vowel-consonant (VC) syllables were presented to 50 undergraduates for recall in which each consonant phoneme was paired with a different vowel. When consonant phonemes in the different sequence types were presented for recall with different vowels, phonetic interference was observed for the middle consonant in place as well as manner of

articulation sequences, and the effect was observed in both CV and VC groups. It is suggested that vowels are encoded in short-term memory in terms of their place of articulation and that presenting consonant phonemes for recall with different vowels caused Ss to use this dimension to code consonant phonemes in short-term memory.—*Journal abstract*.

2409. Salzarulo, P. & Cipolli, C. (Hôpital Henri-Rousselle, Paris, France) **Spontaneously recalled verbal material and its linguistic organization in relation to different stages of sleep.** *Biological Psychology*, 1974, Vol 2(1), 47-57.—Performed 104 sleep recordings in 7 20-25 yr old students who were awakened once in each recorded sleep session, either during slow-wave or fast-wave sleep. Recalled verbal material (RVM) reported on these awakenings was submitted to linguistic analysis. Semantic RVMs were obtained in both conditions in the same proportion. Syntactic RVMs were rarely obtained in slow-wave sleep compared to fast-wave sleep. The length of evoked RVMs depended on the type of sleep (fast-wave sleep; phasic events at the time of awakening) and on its location during the night (last fast-sleep phase). The complexity of RVMs remained identical during the 1st few kernel sentences regardless of the type of sleep. Data suggest that during sleep, different, although probably interrelated, mechanisms underlie RVM evocation and their complexity and control their length.—*Journal abstract*.

2410. Santa, John L. & Lamwers, Linda L. (Rutgers State U, Douglass Coll, New Brunswick) **Encoding specificity: Fact or artifact.** *Journal of Verbal Learning & Verbal Behavior*, 1974(Aug), Vol 13(4), 412-423.—Examined the encoding specificity principle which suggests that Ss can retrieve information from memory only via cues encoded for retrieval at the time of study. 45 undergraduates participated in Exp I and 9 paid Ss in Exp II. Contrary to the encoding specificity hypothesis both experiments suggested that Ss were able to make use of semantic cues which were not likely to have been encoded at time of study. Contrasts of recognition and recall were also examined. Several theoretical problems were noted in such comparisons, and it is concluded that differences between recall and recognition provide no measure of support for encoding specificity.—*Journal abstract*.

2411. Schwartz, Steven & Witherspoon, Kirk D. (Northern Illinois U) **Decision processing in memory: Factors influencing the storage and retrieval of linguistic and form identification.** *Bulletin of the Psychonomic Society*, 1974(Aug), Vol 4(2-B), 127-129.—Attempted to replicate a study by J. D. Bransford and J. J. Franks (see PA, Vol 48:4191) which tested the idea that sentence meaning is stored in a schematic fashion and found that new sentences containing all information conveyed by simpler sentences were more likely to be misidentified as having been seen earlier than sentences containing only part of the information. The present study, using a signal detection framework with 15 undergraduates as Ss, demonstrated that this effect was due not only to schematic organization, but to the retention of the "new" form of the originally presented sentences as well. This form of new sentences conveying only part of the earlier information was remembered better (and less frequently

confused) than new, complex sentences.—*Journal abstract.*

2412. Thompson, Janet T. & Clayton, Keith N. (Vanderbilt U) **Presentation modality, rehearsal-prevention conditions, and auditory confusions in tests of short-term memory.** *Memory & Cognition*, 1974(Jul), Vol 2(3), 426-430.—Describes an experiment with 6 paid graduate students in which Ss were presented four-letter sequences either auditorily or visually and asked for ordered recall after 0, 2.1, 4.2, 8.4, or 12.6 sec of digit categorization. 3 different rehearsal-prevention conditions were required during presentation of the memory set: categorizing, suppressing (saying "ah"), or pronouncing each letter. Recall was worst after categorizing, best after pronouncing. Auditory presentation led to better recall after no delay, but to more rapid forgetting than visual presentation, regardless of the rehearsal-prevention condition. These results, and analyses of auditory confusions, are inconsistent with a view of memory which asserts that sensory information is encoded auditorily regardless of presentation modality or vocalization behavior during presentation. (23 ref)—*Journal abstract.*

2413. Tulving, Endel & Watkins, Michael J. (U Toronto, Ontario, Canada) **Continuity between recall and recognition.** *American Journal of Psychology*, 1973(Dec), Vol 86(4), 739-748.—Discusses (a) the discontinuity hypothesis that recall and recognition are in some sense fundamentally different memory processes; and (b) the continuity hypothesis that retrieval in both modes is essentially the same, a joint product of the information stored in the past and that in the immediate environment. Data from a simple experiment with 20 undergraduates and a brief discussion of other studies in the literature support the proposal that the continuity view is both more parsimonious and more fruitful than the discontinuity view. (20 ref)—*Journal abstract.*

2414. Tversky, Barbara. (Hebrew U, Jerusalem, Israel) **Breadth of pictorial and verbal codes in memory.** *Bulletin of the Psychonomic Society*, 1974(Aug), Vol 4(2-A), 65-68.—Examined the breadth of pictorial and verbal encoding modalities by using reaction times to a same-different task in 4 bilingual Hebrew-English college students. For each of the 4 geometric figures, there were 2 pictorial representations (outline or filled drawings) and 2 verbal representations (the figure names in 2 languages). While the pictorial code was broad enough to allow unmediated comparison of 2 pictures with no visual components in common, the verbal code was not semantic, as had been previously maintained, and did not allow direct comparison of equivalent words in different languages.—*Journal abstract.*

2415. Underwood, Geoffrey. (U Nottingham, England) **Moray vs. the rest: The effects of extended shadowing practice.** *Quarterly Journal of Experimental Psychology*, 1974(Aug), Vol 26(3), 368-372.—Notes that the processing requirements of the shadowing response have led to criticism of its use in selective attention experiments. The present experiment tested a single highly skilled shadower using a task requiring the detection of digits embedded in dichotic lists of letters, with attention being directed to 1 list by use of the shadow technique. This S was able to detect considerably

more digits in both the attended and unattended messages than were groups of unskilled shadowers previously tested. Although performance to the unattended message was high, it remained below performance to the attended message.—*Journal abstract.*

2416. Watkins, Michael J. (U Toronto, Ontario, Canada) **Concept and measurement of primary memory.** *Psychological Bulletin*, 1974(Oct), Vol 81(10), 695-711.—The recency effect in free recall remains relatively constant over experimental conditions that have large and systematic effects on overall level of recall. The effect is commonly attributed to a distinct memory system, known as primary memory. 3 views of primary memory are discussed: the 1st conceptualizes primary memory as a limited capacity store from which information is transferred to a more permanent store, the 2nd equates primary memory with consciousness, the 3rd sees primary memory as a limited capacity retrieval system. Methods for measuring primary memory have been suggested by N. C. Waugh and D. A. Norman (1965), B. Raymond (1969), B. B. Murdock (1967), and E. Tulving (1968, 1970). These methods are critically evaluated, and their relative merits are assessed with a combination of rational and empirical arguments. (63 ref)—*Journal abstract.*

2417. Watkins, Michael J.; Watkins, Olga C. & Crowder, Robert G. (Yale U) **The modality effect in free and serial recall as a function of phonological similarity.** *Journal of Verbal Learning & Verbal Behavior*, 1974(Aug), Vol 13(4), 430-447.—28 undergraduates read lists of phonologically similar or dissimilar words under instructions either for free or for serial recall; additionally, reading was either silent or overt. In free recall primary memory capacity was not affected by phonological similarity, whereas an advantage for the overt over the silent presentation mode was observed with the dissimilar but not the similar lists. Further, phonological similarity reduced the size of the modality effect in serial recall. Apart from its interactive effects with mode of presentation, the effect of similarity on free recall was beneficial for all except the recency items, whereas similarity reduced performance in serial recall. Results allow dismissal of some hypotheses for the modality effect, and in general pose a problem for theories of how similarity affects memory. (58 ref)—*Journal abstract.*

2418. Wells, J. Elisabeth. (Massey U, Palmerston North, New Zealand) **Strength theory and judgments of recency and frequency.** *Journal of Verbal Learning & Verbal Behavior*, 1974(Aug), Vol 13(4), 378-392.—Argues that strength theory can account for certain memory phenomena only if strength is regarded, not as the basic unit of memory, but as some overall measure of the amount of information in store about a particular item. However, not all information need be stored directly.—information about recency and frequency of presentation is potentially derivable from the strength of an item rather than from recency or frequency information per se. This paper examines the evidence for and against such strength theories of recency and frequency, and reports 2 experiments with a total of 28 paid adult Ss. Strength theories of frequency were almost completely discredited. The case against strength theories of recency was less compelling—Ss reverted to using strength as the

basis for recency judgments if specific temporal or serial information was lacking. (41 ref)—*Journal abstract.*

2419. Wickens, Delos D. & Contrucci, Joyce J. (Ohio State U) **The effects of formal and acoustic repetition in the Brown-Peterson paradigm.** *Memory & Cognition*, 1974(Jul), Vol 2(3), 581-584.—Presented the trigram B, K, T to 432 undergraduate Ss on a given trial in L. R. Peterson and M. J. Peterson's (see PA, Vol 34:5499) paradigm. For 1 group this same trigram had been presented 3 trials earlier (exact repetition). For another group the critical item which had preceded the consonant trigram was BEE, KAY, TEA (homophonic repetition). Both groups showed a repetition facilitation significant beyond that of the appropriate control groups. The exact repetition group excelled the homophonic repetition group. Postexperimental questionnaires on awareness of the experimental manipulation did not precisely clarify the results obtained. The data support the view of multiple encoding.—*Journal abstract.*

2420. Wright, P.; Holloway, C. M. & Aldrich, A. R. (MRC Applied Psychology Unit, Cambridge, England) **Attending to visual or auditory verbal information while performing other concurrent tasks.** *Quarterly Journal of Experimental Psychology*, 1974(Aug), Vol 26(3), 454-463.—Investigated the effect of a word recognition task on concurrent nonverbal tasks performed by a total of 48 paid adults in 3 experiments. Results show that (a) auditory verbal messages affected visual tracking performance but not the detection of brief light flashes in the visual periphery, and (b) greater impairment, both of tracking and light detections, when verbal messages were visual rather than auditory. With a kinesthetic tracking task, errors increased significantly during auditory messages but were greater during visual messages. There was no interaction between the modality of tracking error feedback (auditory or visual) and the modality of the verbal message. It is suggested that different temporal characteristics of visual and auditory information affect the attentional demands of verbal messages.—*Journal abstract.*

### Motivation & Emotion

2421. Berkowitz, Leonard & Turner, Charles. (U Wisconsin) **Perceived anger level, instigating agent, and aggression.** In H. London & R. E. Nisbett (Eds), *Thought and feeling: Cognitive alteration of feeling states*. Chicago, IL: Aldine, 1974. 239 p. \$8.95.—80 undergraduates were moderately provoked by 1 of 2 confederates. Ss were then led to believe they had either low, medium, or high anger toward the confederate and were required to give shocks to either the provoker or the neutral confederate. Anger-level feedback was related to the intensity of aggression only when the provoker was the available target.

2422. Bria, Pietro. (U Cattolica del Sacro Cuore, Facoltà di Medicina e Chirurgia, Milan, Italy) **The relationship between thinking and emotion in the works of Ignacio Matte Blanco.** (Ital) *Archivio di Psicologia, Neurologia e Psichiatria*, 1974(Jan), Vol 35(1), 36-49.—The relation between thought and emotion represents a fundamental "modes of being," the atemporal and nispacial mode of being that plays a leading role in motion. This mode of being is based on coercive

thinking. The latter uses spatial-temporal parameters while the former does not. The rich and various psychical phenomenology of human beings emerges from the dynamic interrelation between these 2 modes.—L. L'Abate.

2423. Hill, C. G. (Massey U, Palmerston North, New Zealand) **A psychological view of corporal punishment.** *Delta*, 1973(Jun), No 12, 2-5.—Reviews literature related to effects of reward, punishment, and reinforcement on behavior, and identifies problems associated with study of corporal punishment. It is suggested that punishment has minimal desirable effects on changing behavior, but may reinforce the behavior of the person administering punishment.

2424. Klemp, George O. & Leventhal, Howard. (U Wisconsin) **Self-persuasion and fear reduction from escape behavior.** In H. London & R. E. Nisbett (Eds), *Thought and feeling: Cognitive alteration of feeling states*. Chicago, IL: Aldine, 1974. 239 p. \$8.95.—Replicated a study by R. J. Bandler et al (see PA, Vol 42:13090) which showed that Ss rated a shock as more painful when they chose to escape it than when they chose to sustain their exposure or when E controlled their exposure. Results support the hypothesis that the self-persuasion effect occurs only when S has a high tolerance for shock. (15 ref)

2425. Laird, James & Crosby, Melvin. (Clark U) **Individual differences in self-attribution of emotion.** In H. London & R. E. Nisbett (Eds), *Thought and feeling: Cognitive alteration of feeling states*. Chicago, IL: Aldine, 1974. 239 p. \$8.95.—Hypothesized that people differ in the relative importance of situational and self-produced cues in inferring attributes. Data from 2 replications, in which the expressive behavior of undergraduates was manipulated without their awareness, support the hypothesis of differences in the importance of self-produced cues in the attribution of emotional experience.

2426. London, Harvey & Monello, Lenore. (Long Island U) **Cognitive manipulation of boredom.** In H. London & R. E. Nisbett (Eds), *Thought and feeling: Cognitive alteration of feeling states*. Chicago, IL: Aldine, 1974. 239 p. \$8.95.—High school and college students were led to believe by a rigged clock that a task, actually lasting 20 min, lasted either 10 or 30 min. Ss in the 10-min condition were more bored by the task because from S's viewpoint, time passed more slowly than in the 30-min condition. Data extend S. Schacter's theory of cognitive labeling of bodily states. (17 ref)

2427. London, Harvey & Nisbett, Richard E. (Eds.). (Long Island U) **Thought and feeling: Cognitive alteration of feeling states.** Chicago, IL: Aldine, 1974. 239 p. \$8.95.

2428. Navarick, Douglas J. & Fantino, Edmund. (California State U, Fullerton) **Stochastic transitivity and unidimensional behavior theories.** *Psychological Review*, 1974(Sep), Vol 81(5), 426-441.—Notes that unidimensional theories of choice behavior assume that an S evaluates stimuli on the basis of a common parameter or scale. The unidimensionality assumption is prevalent in theories of human and animal choice behavior, but its empirical implications have been tested infrequently. The major implication of unidimensionality is weak stochastic transitivity, confirmation of which

would suggest that a single factor controls the direction of binary choice. Many theories also assume that a single factor controls choice probability, an assumption requiring confirmation of a stringent form of strong stochastic transitivity (functional equivalence). Methods of testing 5 behaviorally oriented theories, all of which assume unidimensional control of choice probability, are discussed. (44 ref)—*Journal abstract*.

2429. Steele, Daniel G. & Walker, C. Eugene. (Los Alamos Schools, NM) **Male and female differences in reaction to erotic stimuli as related to sexual adjustment.** *Archives of Sexual Behavior*, 1974(Sep), Vol 3(5), 459-470.—100 male and 100 female undergraduates viewed erotic slides depicting a wide range of human sexual behaviors. Each S rated the stimuli on 3 criteria: sexual stimulation, liking for the slide, and extremeness of the behavior portrayed. Ss also completed Thorne's Sex Inventory, which theoretically measures psychosexual adjustment. Males and females reported minimal sexual stimulation and minimal liking for the slides, but males reported greater sexual stimulation and liking than did females. In terms of rated extremeness, males and females showed quite close agreement, differing significantly on only 1 slide. Males rated a greater number of the slides considered to be the more extreme as more sexually stimulating and more liked than did females. Both males and females, however, tended overall to rate the more extreme slides as less sexually stimulating and less liked; this relationship was stronger for females than for males. Scales on the Sex Inventory did not correlate positively with ratings of sexual stimulation and liking for the slides, and scales theoretically indicating sexual maladjustment failed to consistently correlate negatively with ratings of sexual stimulation and liking for the slides for males and females. (29 ref)—*Journal abstract*.

2430. Taylor, Shelley E. & Huesmann, L. Powell. (Yale U) **Replication report: Expectancy confirmed again: A computer investigation of expectancy theory.** *Journal of Experimental Social Psychology*, 1974(Sep), Vol 10(5), 497-501.—Conducted a computerized attempt to replicate E. Aronson's and J. M. Carlsmith's (see PA, Vol 38:10033) expectancy theory. Ss performed consistent with their expectancy, although the effect of expectancy was strongly attenuated by an overall achievement orientation. Results contradict the hypotheses that experimenter bias, demand characteristics, or differential recall of performance mediate the effects of expectancy upon performance.

2431. Valins, Stuart. (State U New York, Stony Brook) **Persistent effects of information about internal reactions: Ineffectiveness of debriefing.** In H. London & R. E. Nisbett (Eds), *Thought and feeling: Cognitive alteration of feeling states*. Chicago, IL: Aldine, 1974. 239 p. \$8.95.—Male undergraduates viewed slides of nude females while hearing about their alleged heart-rate reactions and were then informed that these reactions were part of a deception manipulation. Although Ss accepted the debriefing, the false information continued to exert an influence on their attitudes toward the nudes in that debriefed and nonbriefed Ss had the same attitudes.

2432. Weil, John L. (Harvard U, Medical School, Boston) **A neurophysiological model of emotional and**

**intentional behavior.** Springfield, IL: Charles C Thomas, 1974. xii, 189 p.—Presents flow charts and experimental data which propose a neurophysiological basis of emotion as a function of upper limbic-hypothalamic-reticular discharge through ascending and descending nonspecific activation, and extrapyramidal, visceral and pituitary reactions. A neurophysiological conceptualization of intentional behavior as a function of emotional and cognitive processes is also presented. (9 p ref)

## NEUROLOGY AND PHYSIOLOGY

2433. Cain, Donald P. (McGill U, Montreal, Quebec, Canada) **The role of the olfactory bulb in limbic mechanisms.** *Psychological Bulletin*, 1974(Oct), Vol 81(10), 654-671.—Reviews recent data obtained after peripheral olfactory system damage which, when compared with bulbectomy data, suggest that the olfactory bulb has certain general modulatory functions in addition to its specific sensory role as initial processor of olfactory information. It is proposed that the olfactory bulb is involved in a forebrain arousal mechanism comprised mainly of hypothalamus and limbic system. Behavioral and electrophysiological evidence is discussed that supports the idea that the olfactory bulb may modulate the excitability of forebrain regions. Anatomical details of the system are considered, and its relationship to reinforcement mechanisms and to A. Routtenberg's (see PA, Vol 42:5112 and 47:244) Arousal System II is outlined. (5 p ref) *Journal abstract*.

2434. Hécaen, Henry. (National Inst of Health & Medical Research, Research Unit of Neuropsychology & Neurolinguistics, Lab of Pathology of Language, Paris, France) **[Functional hemispheric asymmetry and behavior.]** (Fren) *Social Science Information*, 1973(Dec), Vol 12(6), 7-23.—Reviews research on morphology and function of cerebral hemispheres. Handedness preference relates to differences between right and left in interhemispheric functional organization. The left hemisphere is more involved in language symbol meanings. Using different sounds to each ear, B. Kimura found retention better for right ear (left hemisphere) than for left ear (right hemisphere). The right hemisphere, classically mute, mediates body awareness and the recognition of human faces. Split-brain research indicates the same. Damage to the left affects sound symbol identification, to the right, perceptual discrimination and patterns. The left temporal is larger than the right in adults, in the newborn, and in the fetus. When the left is damaged, some recuperation is possible through takeover by the right. Disruption by lesions was described by H. Lissauer as apperceptive in the right and associative in the left hemisphere. The author postulates an interhemispheric gradient: at subcortical levels there is more interhemispheric tie-in. Inherent predisposition undergoes rapid maturation; at 1 mo infants show fine discrimination of verbal sounds. (57 ref) *R J Anderson*

2435. Rodieck, R. W. (U Sydney, NSW, Australia) **The vertebrate retina: Principles of structure and function.** San Francisco, CA: W. H. Freeman, 1973. 1044 p.—Presents a comprehensive text about the organization of the vertebrate retina, following the

temporal sequence of events in retinal function. Findings are based on physical, chemical, and structural foundations. The part played by the retina in adaptation and in color vision is included. (52 p ref)

2436. University of Edinburgh. (Scotland) **Recent advances in methods for studying the pharmacology of single central neurones: A symposium held at the University of Edinburgh, 8-9 October 1973.** *Neuropharmacology*, 1974(Jun), Vol 13(6), 401-573.—Discusses attempts to quantify the effects of drug dosages by using dose-response curves, and summarizes drug effects in their action on glial cells and blood vessels and the possibility of interneural connections and transneuronal responses. Evidence is presented for multiple receptor sites with different types of drug responses. Advances concerning the nature and type of cell that is fired, including a hypothesized interneuron, are discussed, and a technique which anatomically identifies cells at the electrode-tip site using histochemical methods is described. Advantages and disadvantages (a) of new techniques for coupling between the recording electrode and the iontophoresis or conductance-measuring electrodes, (b) of stimulus-secretion coupling and the effect of this on membrane conductance, and (c) of the use of ion-selective electrodes are explored.—*B. McLean*.

### Neuroanatomy & Electrophysiology

2437. Armington, John C. & Bloom, Marie B. (Northeastern U) **Relations between the amplitudes of spontaneous saccades and visual responses.** *Journal of the Optical Society of America*, 1974(Sep), Vol 64(9), 1263-1271.—Electroretinograms and visually evoked cortical potentials, dependent on the occurrence of spontaneous saccadic eye movements, were recorded from 3 human Os. A computer system was used to isolate average-response waveforms that resulted from saccadic displacements of the retinal image. The responses were recorded as the O fixed his eye on the center of a steady pattern of vertical stripes presented in maxwellian view. The responses depended on the spatial frequency of the pattern being viewed; in all cases, they were proportional to the extent of saccadic movement. Results are interpreted in terms of response additivity and the numbers of cones stimulated by the image displacement. (40 ref)—*Journal abstract*.

2438. Buchsbaum, Monte S.; Henkin, Robert I. & Christiansen, Richard L. (NIMH, Bethesda, MD) **Age and sex differences in averaged evoked responses in a normal population, with observations on patients with gonadal dysgenesis.** *Electroencephalography & Clinical Neurophysiology*, 1974(Aug), Vol 37(2), 137-144.—Studied visual and auditory average evoked responses (AERs) in 166 normal 6-60 yr old males and females and in 10 14-43 yr old patients with chromatin negative gonadal dysgenesis (45 XO). Females of all ages and patients with 45 XO exhibited larger amplitude AERs than males. No correlation between cephalometric roentgenographs and AER amplitude was found to explain these differences. Younger Ss exhibited larger AER amplitude, and greater increases in amplitude with increasing stimulus intensity; latencies were shorter and increased with increasing intensity rather than decreasing as in older Ss. These findings suggest that levels of

follicle stimulating hormone, luteinizing hormone, or gonadal steroids cannot be the only determinants of the sex differences observed. From the data on patients with 45 XO, it may be hypothesized that the absence of the Y chromosome may be associated with the female AER pattern. (French summary) (34 ref)—*Journal summary*.

2439. Butler, S. R. & Glass, A. (U Birmingham, Medical School, England) **Asymmetries in the CNV over left and right hemispheres while subjects await numeric information.** *Biological Psychology*, 1974, Vol 2(1), 1-16.—Recorded the contingent negative variation (CNV) from frontal and central electrodes in 1 left-handed and 12 right-handed medical students. The CNV was elicited by tachistoscopically exposed visual stimuli comprising a warning spot followed by a numeral. Numerals so exposed had to be memorized (cumulative condition), added (arithmetic condition), or checked to ensure that all were zeros (repetitive condition). The arithmetic and cumulative tasks were designed to potentiate any expectancy mechanisms in the hemisphere dominant for verbal processes. The repetitive task was intended as a neutral control. All 3 tasks elicited CNVs whose amplitude was greater over the hemisphere contralateral to the preferred hand. Results are discussed in terms of possible relationships with handedness and the lateralization of cerebral function. (43 ref)—*Journal abstract*.

2440. Cael, William W.; Nash, Allan & Singer, Jay J. (Florida Atlantic U) **The late positive components of the human EEG in a signal detection task.** *Neuropsychologia*, 1974(Jul), Vol 12(3), 385-387.—Attempted to replicate a study by S. Hillyard et al (1971) which used human Ss in a signal detection task and obtained a prominent late positive component (LPC) of the EEG only in the Hit category of responses. They concluded that the LPC reflected S's degree of certainty that a signal has occurred. In contrast the present study, which used 8 undergraduates, found that the LPC occurred in the Hit, Miss, and Correct Rejection categories of responses, thereby supporting the hypothesis that the LPC is a correlate of uncertainty reduction and does not directly depend on the physical presence of the signal. (French & German summaries)—*Journal abstract*.

2441. DeArmond, Stephen J.; Fusco, Madeline M. & Dewey, Maynard M. (Medical Coll Pennsylvania, Philadelphia) **Structure of the human brain: A photographic atlas.** New York, NY: Oxford U Press, 1974. ix, 166 p.

2442. Desmedt, J. E.; Brunko, E.; Debecker, J. & Carmeliet, J. (U Brussels, Brain Research Unit, Belgium) **The system bandpass required to avoid distortion of early components when averaging somatosensory evoked potentials.** *Electroencephalography & Clinical Neurophysiology*, 1974(Oct), Vol 37(4), 407-410.—Studied the effects of 14 filter conditions with cutoff ranging from 3 kc/sec to 50 c/sec and with either 6 or 24 db/octave roll off when averaging the somatosensory cerebral potentials evoked by electrical stimulation of fingers in 8 21-37 yr old normal adult men. Severe distortions of latencies and voltages were observed for low-pass filtering below 1 kc/sec. It is emphasized that the overall system bandpass should extend to 3 kc/sec when studying the early components and when estimating the onset latency of the surface negative N<sub>1</sub> component. Precise information about the system band-

pass used should be included in published reports.

2443. Doyle, Joseph C.; Ornstein, Robert & Galin, David. (Langley Porter Neuropsychiatric Inst, Inst for the Study of Human Consciousness, San Francisco, CA) **Lateral specialization of cognitive mode: II. EEG frequency analysis.** *Psychophysiology*, 1974(Sep), Vol 11(5), 567-578.—Conducted a frequency analysis of hemispheric EEG asymmetries in 10 normal right-handed adults performing cognitive tasks. Language and arithmetic tasks were expected to engage primarily the left hemisphere; spatial and musical tasks were expected to engage primarily the right hemisphere. Recordings from temporal leads and parietal leads referred to the vertex were subjected to discrete Fourier transforms; ratios of power from homologous leads were computed in conventional frequency bands. These ratios (right-left) were significantly higher in verbal and arithmetic tasks than in spatial tasks primarily in the alpha band. Considering the alpha band alone revealed a task dependence of the asymmetry 2-5 times greater than reported earlier for whole band power. Whenever a significant task dependence of asymmetry appeared in any band, it was in the same direction; the hemisphere primarily engaged in the cognitive activity developed proportionately less power. The requirement of motor output increased the task dependence of alpha asymmetry and lowered alpha power levels. (25 ref)—*Journal abstract.*

2444. Edwards, David C. (Iowa State U) **Stimulus intensity and recency contrasts and orienting response strength.** *Psychophysiology*, 1974(Sep), Vol 11(5), 543-547.—300 university students heard sequences of noise pulses. Skin conductance response (SCR) magnitudes revealed that intensity and recency effects remained effective during habituation trials. Habituation of the SCR magnitude occurred to stimuli that were presented in a pattern composed of 2 intensities and to stimuli in a pattern of 2 interstimulus intervals, though the specific differential effects of level of intensity and of recency remained clearly evident. There appeared an enhancement of response magnitude to intense stimuli (an apparent contrast effect) when they were presented in that pattern of 2 intensities and compared to response to suitable control sequences. After significant but not complete habituation occurred, a reduction in stimulus intensity or of interstimulus interval reduced SCR magnitude further. (16 ref)—*Journal abstract.*

2445. Eggermont, J. J. & Odenthal, D. W. (U Medical Ctr, Leiden, Netherlands) **Methods in electrocochleography.** *Acta Oto-Laryngologica*, 1974, Suppl 316, 17-24.—Human electrocochleography is reviewed and the significance of the recorded potentials is discussed, with special reference to the recording site. Response amplitude and threshold values for transtympanic action-potential recording are compared for various recording sites. In addition, click and tone-burst results are compared with respect to frequency specificity and accordance with subjective thresholds. (49 ref)

2446. Eggermont, J. J. & Odenthal, D. W. (U Medical Ctr, Leiden, Netherlands) **Action potentials and summing potentials in the normal human cochlea.** *Acta Oto-Laryngologica*, 1974, Suppl 316, 39-61.—Describes

the properties of both the compound action potential and summing potential, based on a study of 18 normal human cochleas. The summing potentials are discussed with respect to the input-output behavior and occurrence of positive and negative summing potentials. The compound action potential is discussed with respect to (a) amplitude-intensity and latency-intensity behavior, (b) the action potential waveform, (c) adaptation and masking properties, and (d) amplitude-latency and width-latency relations describing the internal synchronization for the components of the compound action potential. A regression analysis was performed for the amplitude-latency scattergrams to provide adequate data reduction. Detailed properties of the 2 populations of neural units are given, and a morphological substrate is proposed. A comparison is made between results obtained in humans and guinea pigs.—*Journal abstract.*

2447. Eggermont, J. J. (U Medical Ctr, Leiden, Netherlands) **Basic principles for electrocochleography.** *Acta Oto-Laryngologica*, 1974, Suppl 316, 7-16. Describes the stimulus-related cochlear potentials in terms of their usefulness in human electrocochleography (ECOG). It is concluded that cochlear microphonics cannot provide information about the integrity of hair cells outside the most basal part of the cochlea and therefore are not useful for ECOG. Other considerations when performing clinical ECOG are also discussed. (39 ref)

2448. Flamm, Lois E. (Texas A&M U) **Electroretinogram and visually evoked potential associated with paced saccadic displacement of the stimulus.** *Journal of the Optical Society of America*, 1974(Sep), Vol 64(9), 1256-1262.—In a 3-part experiment with a total of 4 Ss, 2 Os made saccadic eye movements of specified distance horizontally across the central opaque stripe in circular patterns of vertically oriented stripes that differed in area or spatial frequency. Electroretinograms (ERGs) and visually evoked cortical potentials (VECPs) were recorded simultaneously. When the S moved his eye through either a fraction of a stripe width in a fixed-stimulus configuration or a complete stripe width across stimuli of various diameters, ERG amplitude increased linearly with the number of visual cells activated. When illuminance changes over equal numbers of receptors were produced by having the S make full-stripe saccades in fixed-diameter gratings of various spatial frequencies, the resulting ERGs were of approximately equal size. The VECPS showed monotonic increases of amplitude with increasing saccade size and area of stimulation. (20 ref)

2449. Foret, J. & Benoit, O. (Lab de Physiologie du Travail, Paris, France) **[Sleep patterns of workers on rotating shifts.]** (Fren) *Electroencephalography & Clinical Neurophysiology*, 1974(Oct), Vol 37(4), 337-344.—Recorded EEG activity and sleep patterns during nocturnal and diurnal sleep in workers who had been on rotating work shifts for several years. The duration of sleep was reduced when it took place during the daytime or at times other than usual sleep periods. The later S went to sleep, the shorter was the duration of daytime sleep. The amount of daytime paradoxical sleep (PS) was less than during the night, but the amount of slow wave sleep (SWS) was practically the same in these 2 conditions. PS

increased as a function of time in a given period of sleep during both the night and day, but increased more rapidly during the first cycles of daytime sleep. PS and SWS were dependent on the time when sleep began but in different manners: PS followed a circadian rhythm with the most favorable period in the nycthemeron at the end of the night and in the beginning of the morning, while SWS was more dependent on the duration of the previous waking period. It is concluded that the difficulties experienced by workers with alternating work schedules should be attributed more to the schedule shift than to the lack of sleep itself. (21 ref)—*English summary*.

2450. Furst, Charles J.; Gardner, Joanne & Kamiya, Joe. (Dartmouth Coll) **Posterior alpha-wave characteristics of eidetic children.** *Psychophysiology*, 1974(Sep), Vol 11(5), 603-606.—Investigated 4 5½–11 yr old right-handed children who reported having eidetic images. 10 other Ss served as controls. It was found that high-amplitude occipital alpha activity occurred during eidetic periods, contrary to the usual observation in adults that visual imagery tends to block alpha waves. In addition, these children had higher resting baseline alpha than the controls.—*Journal abstract*.

2451. Gentle, Michael J. (Poultry Research Ctr, Edinburgh, Scotland) **Changes in habituation of the EEG to water deprivation and crop loading in *Gallus domesticus*.** *Physiology & Behavior*, 1974(Jul), Vol 13(1), 15-19.—Recorded arousal changes in the EEGs of 10 implanted Brown Leghorn hens in response to successive oral stimuli with distilled water following either overnight water deprivation or previous loading of the crop with 50 ml of distilled water. From the EEG record it appeared that the Ss took longer to habituate to the distilled water after deprivation, and there was a very marked increase in the length of arousal following crop loading. This increase was accompanied by behavioral evidence that the water was aversive. It is concluded that the type of feedback from the oral receptors depends on the physiological state of the animal. (18 ref)—*Journal abstract*.

2452. Haaland, K. York. (VA Hosp. Albuquerque, NM) **The effect of dichotic, monaural and diotic verbal stimuli on auditory evoked potentials.** *Neuropsychologia*, 1974(Jul), Vol 12(3), 339-345.—To clarify the nature of the right ear preference in dichotic listening to speech stimuli, comparisons were made between evoked responses from the 2 hemispheres of 9 right-handed normal males when verbal input (dichotic, monaural, or diotic) and response accuracy varied. The positive component of the evoked response was significantly larger in the right hemisphere in all conditions. No significant asymmetry was seen in the negative component. Negative and positive components did not vary with response accuracy. However, the negative component was significantly larger in dichotic tasks than in all others. This difference may be related to complexity of dichotic input or to inhibition of the ipsilateral auditory pathway during dichotic stimulation. (French & German summaries) (21 ref)—*Journal abstract*.

2453. Hord, David; Tracy, Mary & Naitoh, Paul. (US Navy Medical Neuropsychiatric Research Unit, San Diego, CA) **Intra-hemispheric phase relationships during self-regulated alpha activity.** *Electroencephalography*

& *Clinical Neurophysiology*, 1974(Aug), Vol 37(2), 133-136.—Examined the phase angle of frontal-occipital alpha in 6 college students during 45-min alpha feedback sessions in which a contingent auditory reinforcer was used to maximize occipital alpha abundance. During the baseline and early part of the feedback session the mean phase angle for the Ss was approximately 40–42 msec with occipital alpha leading frontal alpha. During the latter part of the contingent feedback period the average phase angle increased significantly to approximately 47 msec. The results were consistent for repeated alpha feedback sessions separated by several days. (French summary)—*Journal summary*.

2454. Ikeda, Terutika. (Kyushu U, Faculty of Medicine, Fukuoka, Japan) [Later component of optic evoked potential during affective behavior in cats.] (Japn) *Kyushu Neuro-psychiatry*, 1971(Oct), Vol 17(2), 85-89.—Investigated evoked potential induced by optic nerve stimulation during conditioned avoidance behavior in cats. The later potential, whose negative peak occurred at the latency of 16 msec, appeared to follow the primary optic evoked potential under a high level of arousal. This potential was usually concealed by the myogenic extracerebral potential, and its full appearance was made under Flaxedil immobilization. A close correlation was found between the later potential and the reticular potential. The postsynaptic component of the optic evoked potential increased with the elevation of arousal level up to a given level, at which augmentation of the potential ceased. The relation of the optic evoked potential to the reticular arousal level is discussed.—*English summary*.

2455. Kasamatsu, Akira & Hirai, Tomio. (U Tokyo, Branch Hosp, Japan) **An electroencephalographic study on the Zen meditation (zazen).** *Journal of the American Institute of Hypnosis*, 1973(May), Vol 14(3), 107-114.—Studied alpha blocking by observing the EEG response to repetitive click stimulation in 48 priests and followers of Zen Buddhism. Results show that (a) Zen meditation with opened eyes produced a fairly constant alpha blocking time (3–5 sec) to every stimuli; and (b) while the habituation of alpha waves in 4 control Ss occurred very quickly, this was not the case in the 3 Zen masters. (32 ref)—*M. E. Pounzel*.

2456. Kimsey, Randall A.; Dyer, Robert S. & Petri, Herbert L. (U Delaware) **Relationship between hippocampal EEG, novelty, and frustration in the rat.** *Behavioral Biology*, 1974(Aug), Vol 11(4), 561-568.—In a single alternation runway task, hippocampal EEG's of 7 implanted male Sprague-Dawley rats changed with learning. At the goal cup, EEG frequencies varied depending upon whether a trial was reinforced or nonreinforced. Frequencies of 7.5–8.5 Hz accompanied nonreinforced trials while lower-frequency less synchronized activity accompanied reinforced trials. These EEG patterns did not appear closely related to novelty or frustrative nonreward.—*Journal abstract*.

2457. Kinkaide, Perry S. & Walley, Roc E. (U Alberta, Edmonton, Canada) **Visual evoked potentials during stimulus selection in eyelid conditioning in the rabbit (*Oryctolagus cuniculus*).** *Journal of Comparative & Physiological Psychology*, 1974(Sep), Vol 87(3), 481-494.—The eyeblinks of 24 New Zealand white rabbits were

conditioned in Exp I to either the visual or the nonvisual element of a compound conditioned stimulus. Evoked potentials (EPs) were simultaneously recorded from the visual cortex. Changes in the late negative component of the EP were related to nonspecific arousal effects. The initial surface positive component, however, was significantly enhanced during visual stimulus control. This enhancement was observed whether the visual stimulus was presented alone or in compound and with either photic or optic chiasma stimulation as the visual stimulus. The effect could not be attributed to arousal, sensitization, or to peripheral mechanisms. Some implications of the data were assessed through a subsequent investigation in Exp II of geniculostriate recovery cycles under the same conditions. (28 ref)—*Journal abstract.*

2458. Lynch, James L.; Paskewitz, David A. & Orne, Martin T. (U Maryland, Medical School, Inst of Psychiatry & Human Behavior, Baltimore) **Some factors in the feedback control of human alpha rhythm.** *Psychosomatic Medicine*, 1974(Sep-Oct), Vol 36(5), 399-410.—Conducted 3 experiments to explore factors involved in the biofeedback control of human alpha rhythm. 21 Ss were given either auditory or visual feedback regarding the occurrence of alpha activity in their EEG record; 8 Ss were run as a noncontingent feedback control group. Significant linear increases in alpha density across feedback trials were observed in all Ss given visual feedback, including the control group. Auditory feedback did not lead to significant increases in alpha density across feedback trials, and levels approached but did not exceed the initial preexperimental baseline levels. Data do not support the view that the feedback situation produces levels of alpha activity greater than those seen under natural baseline conditions or that accurate feedback is necessary to demonstrate gradual trial-to-trial increases in this rhythm. The data do suggest that alpha densities observed in the feedback situation have less to do with feedback per se or a learning process than with the experimental situation and S's own natural alpha densities. Results support the position that increases in human alpha activity occur in feedback situations when the individual disinhibits various stimulus, attentional, and arousal factors that normally block this rhythm. 2460. Mailloux, J. G. et al. (U Ottawa, Faculty of Medicine, Ontario, Canada) **Effects of differential rearing on cortical evoked potentials of the albino rat.** *Journal of Comparative & Physiological Psychology*, 1974(Sep), Vol 87(3), 475-480.—3 groups of Sprague-Dawley albino rats were reared in different environments from weaning to the age of 95 days. One group was in a visually enriched environment ( $n = 8$ ), a 2nd group was in an auditorily enriched environment ( $n = 8$ ) and a 3rd group, controls, received no enrichment ( $n = 16$ ). Photic and auditory evoked potentials were recorded in unanesthetized Ss from chronically implanted epidural electrodes over the visual and auditory cortex. Ss whose enrichment included visual stimulation yielded significantly

shorter latencies in their photic evoked responses recorded over the visual cortex than latencies recorded from controls or from Ss whose enrichment excluded visual stimulation. (17 ref)—*Journal abstract.*

2461. Milstein, Victor. (U Indiana, Medical Ctr, Indianapolis) **Alpha wave phase and alpha attenuation.** *Electroencephalography & Clinical Neurophysiology*, 1974(Aug), Vol 37(2), 167-172.—Examined habituation of the alpha attenuation response (AAR) to both visual and auditory stimuli to determine whether different degrees of habituation would be demonstrated when stimuli were presented at different phases of the alpha wave. Contingent alpha attenuation in a paired click-flash sequence was also examined. 60 hospital personnel and medical and nursing students with abundant, fairly high amplitude alpha activity were assigned randomly to 1 of 5 groups determined by the point on the alpha wave at which they were stimulated. The groups were further divided into 4 subgroups, each of which had the procedure repeated with stimuli presented at 1 of the other points on the alpha wave. The duration of the AAR decreased with successive blocks of trials to the least extent and most slowly for Ss stimulated randomly. Duration decreased most rapidly for the group stimulated at the peak of alpha wave with clicks and for the group stimulated midway on the up-going portion of the wave with flashes. In the paired condition, Ss stimulated at the trough of the wave tended to reach criterion in the fewest number of trials. Results suggest that phase of the alpha wave is associated with cortical excitability. (French summary)—*Journal summary.*

2462. Nakao, Hiroshi. (Kyushu U, Faculty of Medicine, Fukuoka, Japan) **[Brain mechanism of fear and anger.]** (Japn) *Kyushu Neuro-psychiatry*, 1971(Dec), Vol 17(3-4), 113-118.—Discusses basic brain functions of fear, anger, and conflict from the standpoint of "brain-behaviorism." Electrophysiological evidence shows that electrical stimulation of the hypothalamus and part of the limbic system can evoke both fear and anger; however, it is still not known whether each nerve cell in these areas has its own function. Behaviorally, the hypothalamus may be divided into 2 major parts, the lateral area and the medial area. The lateral area is related to sleep, pleasure, and self-stimulation while the medial area is related to fear and anger. It is concluded that conflict can be effectively studied by the use of a behavioral model based on concepts of physiological psychology.—S. Ashida.

2463. O'Brien, James H. & Packham, Steven C. (U Oregon, Medical School) **Habituation of cell activity in cat postcruciate cortex.** *Journal of Comparative & Physiological Psychology*, 1974(Oct), Vol 87(4), 781-786.—Recorded single cell activity in postcruciate cortex of 50 acutely prepared cats during habituation and classical conditioning. Background firing rate and evoked activity in light (conditioned stimulus) were examined. Based on P. M. Groves and R. F. Thompson's (1970) dual-process theory of habituation, it was hypothesized that neurons which exhibit habituation should also show the best conditioning. Neurons which exhibited response decreases during the habituation series produced slightly larger changes in response during conditioning, but the effect was essentially a maintained early change in response

rather than a response development analogous to learning. In contrast, neurons which exhibited response increases during the habituation series produced developmental response changes during conditioning. A single neuron exhibited both increases in response and habituation effects, but these effects were located at different response intervals following the stimulus.—*Journal abstract*.

2464. Ornitz, Edward M. et al. (U California, Medical School, Los Angeles) **The recovery cycle of the averaged auditory evoked response during sleep in normal children.** *Electroencephalography & Clinical Neurophysiology*, 1974(Aug), Vol 37(2), 113-122.—Studied the recovery cycle of the averaged auditory evoked response to paired clicks during Stage 2 and rapid eye-movement (REM) sleep in 23 normal 22-67 mo old children. Stimulus separations of 250, 160, 80, 40, 20, and 10 msec were used, and paired clicks were alternated with single clicks every 2.0 sec throughout the night. It was found that in Stage 2 sleep there was a significant reduction of amplitude recovery at stimulus separations of 250 and 20 msec, while this reduction occurred at all stimulus separations during REM sleep. The reduction of amplitude recovery was significantly greater during REM sleep than during Stage 2 sleep at stimulus separations of 80 msec or less. However, the amplitude recovery cycle in the 2 sleep stages was similar, and was best described by a combination of linear and cubic components. In Stage 2 sleep, the only significant effect on latency recovery was a slight delay at an 80-msec stimulus separation. During REM sleep significant delays in recovery occurred at 80, 40, and 20 msec. In both sleep stages, the latency recovery cycle showed a significant linear delay in recovery with shorter stimulus separations. Increased amplitude recovery and delay in recovery during REM sleep at a 250-msec stimulus separation occurred with increasing age. (French summary) (29 ref)—*Journal summary*.

2465. Peters, Michael. (British Columbia Mental Health Branch, Tranquille, Canada) **A schematic atlas of the cerebellum of the rat.** *Physiology & Behavior*, 1974(Jul), Vol 13(1), 133-141.—Shows 32 sagittal and 22 frontal sections of the Wistar AF/Han albino rat cerebellum. The selection of sections emphasizes areas of the cerebellum which contain the cerebellar nuclei. Each section is provided with stereotaxic coordinates.

2466. Pinson, Lewis J. & Childers, Donald G. (Auburn U) **Frequency-wavenumber spectrum analysis of EEG multielectrode array data.** *IEEE Transactions on Biomedical Engineering*, 1974(May), Vol 21(3), 192-206.—Analyzes EEG data consisting of (a) visual evoked responses monitored via an array of electrodes from humans and (b) penicillin-induced focal epileptic discharge data recorded from rat neocortex. This procedure, previously applied to seismic array data, offers a method by which high-resolution vector velocity, and thus the direction and speed of propagating wavefronts, can be estimated.

2467. Prevec, Tine S.; Lokar, Jože & Černeč, Smilja. (U Ljubljana Hosp, Inst of Clinical Neurophysiology, Yugoslavia) **The use of CNV in audiometry.** *Audiology*, 1974, Vol 13(6), 447-457.—Used the contingent negative variation (CNV) to design an objective test of the

threshold of perception of a simple acoustic stimulus by 8 volunteers with normal hearing. A tone of adjustable intensity was delivered by an audiometer to predict a 2nd stimulus (weak flash of light) to follow after a short interval. A CNV was generated during this interval if the S expected the 2nd stimulus. When the S did not perceive the tone, the CNV did not appear. Acoustic stimuli near the threshold frequently produced a CNV of higher amplitude than those following stronger stimuli. Comparatively short intervals between the conditioning and the test stimulus could be used. The advantages of the use of the CNV as an objective audiometric test as compared to evoked cerebral potential audiometry and the possibility of using the method in clinical practice are discussed. (French summary) (40 ref)—*Journal abstract*.

2468. Sano, Katsunori; Iwahara, Shinkuro & Sano, Atsuko. (Tokyo U of Education, Japan) **[Hippocampal electrical activity in spontaneous behavior and active avoidance conditioning in rats.]** (Japn) *Annual of Animal Psychology*, 1972, Vol 22(2), 70-81.—Investigated the frequency characteristics of the hippocampal EEG in relation to behavior patterns. Bipolar recording electrodes were implanted into the brain of 8 adult male rats, and the hippocampal EEG was continuously examined with an electronic frequency analyzer. Regular slow waves of 7-9 Hz (theta waves) appeared when the Ss were making head or body movements related to search and attention. During the acquisition of 1-way avoidance response, the theta waves appeared upon the presentation of a warning signal. The frequency shifted from 7 Hz to 10 Hz a few seconds before the occurrence of an avoidance response, and returned to 6-8 Hz after the response. The theta waves are more closely related to attention than to learning or voluntary responses. (English summary)—S. Nakajima.

2469. Schlehuber, Cameron J.; Flaming, Dale G.; Lange, G. David & Spooner, Charles E. (U California, Medical School, Davis) **Paradoxical sleep in the chick (*Gallus domesticus*).** *Behavioral Biology*, 1974(Aug), Vol 11(4), 537-546.—Classified states of sleep and wakefulness in 17 White Leghorn cockerel chicks by computerized monitoring of multiple unit activity, EEG, and electromyographic recordings. Ss of 1 day, 1 wk, 1 mo, and 4 mo of age, were monitored for paradoxical sleep (PS) on a 12-hr-day-12-hr-night cycle. No significant differences could be distinguished among the Ss 1 wk and older. Obvious PS periods were shorter and fewer for the day-old Ss, and total PS appeared to be less than half that of the older Ss. A trend in frequency of PS through the night was evident in the older Ss. As the sleep period progressed, PS increased from less than 5 to more than 25% of sleep by the termination of the night period. The PS increase was due to an increase in the frequency of occurrence of the periods, rather than a lengthening of each period. Percentage of total PS and the increase in the absolute amount of PS through the sleep period in the older chick is slightly similar to man, but the pattern is different. (17 ref)—*Journal abstract*.

2470. Schlue, Wolf R. (U Göttingen, W Germany) **[Central nervous system organization of the escape reflex in the cockroach (*Periplaneta americana*): II. Fatigue processes in cercal reflex arc.]** (Germ) *Zeitschrift für Tierpsychologie*, 1974(Mar), Vol 34(3), 224-238.

—Studied electrophysiological mechanisms of fatigue of the cockroach cercal escape response. Fatigue was associated with synaptic changes in the abdominal ganglion VI, and the synapses involved were those between sensory fibers and interneurons and not between sensory fibers and giant fibers. (English summary)

2471. Schlue, Wolf R. (U Göttingen, Zoological Inst, W Germany) [Central nervous system organization of the cercal escape reflex in the cockroach *Periplaneta americana*: I. Transformation of cercal excitation into leg motoneurone efferences.] (Germ) *Zeitschrift für Tierpsychologie*, 1974(Feb), Vol 34(2), 172-207.—Studied transformation of afferent signals into different patterns of motor response. Cercal sensillae, the cercal nerve, or the abdominal cord were stimulated and neural activity in various efferent nerves was recorded.

2472. Schmidt, P. H. & Spoor, A. U. (U Medical Ctr, Leiden, Netherlands) The place of electrocochleography in clinical audiometry. *Acta Oto-Laryngologica*, 1974, Suppl 316, 5-6.—Discusses the advantages and disadvantages of using electrocochleography (ECOG) compared to auditory-evoked-response and psychogalvanic-response audiometry. Major reasons for using ECOG are outlined, including the need to obtain objectively determined thresholds in patients for whom subjective audiometry is not feasible.

2473. Sharrard, G. A. (U Manchester, England) A study of auditory evoked responses during sleep. *Audiology*, 1974, Vol 13(6), 458-463.—Studied the evoked responses to tones in different stages of sleep in a group of 31 normally hearing medical and dental students. The stage of sleep was monitored by experienced workers in EEG and the responses recorded together with the stage of sleep in which they were elicited. Attention was paid to the shape, amplitude, latency, and clarity of responses. Statistical attention was paid to the relationship between stage of sleep and the above qualities of the responses. It was found most useful to stimulate with a 1,000-Hz tone of 75 db intensity since this gave a clear response without disturbing the depth of sleep. The most favorable periods appeared to be Stages 2 and 3; the least favorable were Stages 4 and that of rapid eye movement. (French summary)—*Journal abstract*.

2474. Smith, D. B. & Strawbridge, P. J. (U Southern California, Inst of Safety & Systems Management) Auditory and visual evoked potentials during hyperoxia. *Electroencephalography & Clinical Neurophysiology*, 1974(Oct), Vol 37(4), 393-398.—Recorded averaged evoked potentials (AEP) and contingent negative variations (CNV) in Ss who breathed air and oxygen at 1 atm. No effect of hyperoxia was found on the auditory AEP, visual AEP, or CNV, nor was a prior report of enhancement of the after-discharge of the visual AEP observed. (French summary) (25 ref)

2475. Spoor, A. (U Medical Ctr, Leiden, Netherlands) Apparatus for electrocochleography. *Acta Oto-Laryngologica*, 1974, Suppl 316, 25-36.—Describes the recording and stimulation components of an apparatus for electrocochleography, designed to be used in experimental work and in auditory evoked potential audiometry.

2476. Stark, Louis H. & Norton, James C. (U Kentucky, Medical Ctr) The relative reliability of average evoked response parameters. *Psychophysiology*, 1974(Sep), Vol 11(5), 600-602.—19 male alcoholic volunteers served as Ss in a study to determine the relative test-retest reliability of various average evoked response (AER) parameters. Slope was found to be the most reliable measure. Implications for group studies using AER techniques are drawn.

2477. Waters, William F. & McDonald, David G. (U Missouri) Effects of "below-zero" habituation on spontaneous recovery and dishabituation of the orienting response. *Psychophysiology*, 1974(Sep), Vol 11(5), 548-558.—20 male undergraduate Ss underwent habituation of the skin conductance component of the orienting response to a neutral tone, spontaneous recovery, rehabituation, and dishabituation (habituation, H condition). Another 20 Ss underwent the same procedure, except they received an additional 10 stimulus presentations immediately after initial habituation (extended habituation, EH condition). The EH condition resulted in more (nonsignificant) spontaneous recovery and trials to rehabituation than did the H condition, indicating that such a "below-zero" habituation procedure did not strengthen habituation. There were significant differences between the groups in response to a postrehabilitation buzzer (dishabituating stimulus), and in response to the subsequent re-presentation of the original tone stimulus (dishabituation), the EH group giving larger responses than the H group. These latter results are consonant with both Y. N. Sokolov's (1963) and P. M. Groves and R. F. Thompson's (1970) approaches to habituation.—*Journal abstract*.

2478. Zschocke, St. (U Hamburg, Neurology Clinic, W Germany) An electronic device for continuous counting of chemically induced epileptic discharges. *Electroencephalography & Clinical Neurophysiology*, 1974(Aug), Vol 37(2), 191-193.—The amplitude discriminating power for detection of epileptic interictal "spikes" can be increased by a preceding differentiation of the EEG, which enables a selective amplification of the seizure potentials with respect to their slope. A device is described which rejects the spurious pulses obtained with this procedure by using a monostable multivibrator. (French summary)

2479. Zuckerman, Marvin; Murtaugh, Thomas & Siegel, Jerome. (U Delaware) Sensation seeking and cortical augmenting-reducing. *Psychophysiology*, 1974(Sep), Vol 11(5), 535-542.—Presented 49 male undergraduates with 5 intensities of light flashes in randomly presented blocks of trials at each intensity. Averaged evoked response (AER) amplitudes were measured at each intensity of light. Augmenting-reducing was measured for each S as the slope of the relationship between stimulus intensity and amplitude of response. This slope measure correlated very significantly ( $r = .59$ ) with the Disinhibition subscale of the Sensation Seeking Scales and positively, but not significantly, with other subscales. Comparing the low and high scorers on the Disinhibition scale, a significant interaction between groups and stimulus intensities was found. The high disinhibitors did not differ from the lows at the low stimulus intensities but did differ significantly at the

highest intensity where the lows showed a marked reducing tendency. Results show an interesting convergence between the Disinhibition type of sensation seeking, manic tendencies, and the AER. (23 ref) —*Journal abstract.*

2480. Adamson, Robert. (Florida Atlantic U) **Count-sampling circuits for heart-rate conditioning and other applications.** *Behavior Research Methods & Instrumentation*, 1974(Jul), Vol 6(4), 407-408.—Describes count-sampling circuits which enable E to preset sample intervals and critical response rates (e.g., heart rates). The configurations are relatively inexpensive and easy to build.

2481. Axelrod, Julius. (National Inst of Mental Health, Lab of Clinical Science, Bethesda, MD) **The pineal gland: A neurochemical transducer.** *Science*, 1974(Jun), Vol 184(4144), 1341-1348.—Examines evidence from the literature which supports the existence of circadian rhythms in serotonin, serotonin N-acetyltransferase, N-acetylserotonin, and melatonin in the pineal gland which persist in continuous darkness and are abruptly abolished by exposure to light. These rhythms are generated by diurnal changes in the release of the neurotransmitter noradrenaline from sympathetic nerve terminals innervating the pineal. The responsiveness of the pineal  $\beta$ -adrenergic receptor changes and becomes supersensitive after decreased exposure to the catecholamines noradrenaline and isoproterenol and subsensitive after increased exposure to the catecholamines. It is concluded that the circadian rhythm in pineal amines appears to arise from a biological clock present in or near the suprachiasmatic nucleus in the hypothalamus. This clock is modulated by inhibition through environmental light. (62 ref)—*Journal summary.*

2482. Barbeau, André & Donaldson, John. (Clinical Research Inst of Montreal, Quebec, Canada) **Zinc, taurine, and epilepsy.** *Archives of Neurology*, 1974(Jan), Vol 30(1), 52-58.—Reviews recent findings that suggest that taurine, a nonessential amino acid, can prevent experimental seizures in mice, cats, and rats and some forms of seizure in man. Taurine and zinc metabolism seem closely related to epileptogenicity. Zinc, injected intraventricularly, leads to epileptic seizures in rats while taurine decreases seizures. Results suggest the need for conducting controlled therapeutic trials of taurine and detailed biochemical study of zinc metabolism in human epilepsy. (114 ref)—*E. A. Gavin.*

2483. Chouvet, Guy et al. (U Claude Bernard, Hôpital Neurologique, Lyon, France) **[Bicircadian period of sleep, waking cycle in "beyond time" isolation: A polygraphic study.]** (Fren) *Electroencephalography & Clinical Neurophysiology*, 1974(Oct), Vol 37(4), 367-380.—Reports data from polygraphic recordings of 3 young male Ss who were isolated "beyond time" in caves for 5-6 mo. Control recordings were obtained just before and after isolation. With variable latencies, all Ss reached a bicircadian rhythm (34 hrs of wakefulness followed by 14 hrs of sleep) which they subjectively considered to be a 24-hr cycle. Only 1 S was able to adapt completely to this new rhythm and maintain it over more than 2 mo. Several variations in sleep were observed, including (a)

the periodicity of paradoxical sleep (PS) remained unchanged while the sleep-waking rhythm was disrupted; (b) the total sleep duration was not correlated with the duration of the previous waking period, although both the duration of Stages 3 and 4 and PS remained in constant relationship with it; and (c) PS onset latencies in the 2 Ss unable to maintain a bicircadian rhythm were shortened. (19 ref)—*English summary.*

2484. Connor, William H. (State U New York, Binghamton) **Effects of brief relaxation training on autonomic response to anxiety-evoking stimuli.** *Psychophysiology*, 1974(Sep), Vol 11(5), 591-599.—Autonomic response effects of relaxation training are sometimes considered secondary to either cognitive or autonomic level change. In the present experiment, specific instruction and training were provided to 84 paid male undergraduates in making relaxation responses to a cue stimulus which was used subsequently in 2 mild anxiety conditions. Brief relaxation training did not significantly affect either verbal report of anxiety or autonomic level following training but did affect autonomic response in the anxiety conditions. Results suggest that autonomic response modification can be accomplished by instruction and relatively minimal training. Autonomic response effects need not be accompanied by either verbal report of greater relaxation or autonomic level modification. These results are difficult to account for by any theoretical model of desensitization which considers autonomic response change secondary to either cognitive or autonomic level change. (30 ref)—*Journal abstract.*

2485. DeLuca, Donald C.; Murphree, Oddist D. & Angel, Charles. (U Arkansas, Medical Ctr, Little Rock) **Biochemistry of nervous dogs.** *Pavlovian Journal of Biological Science*, 1974(Jul-Sep), Vol 9(3), 136-148.—Studied biochemical and behavioral differences between the A and E strains of pointer dogs. Nervous (E strain) dogs are more responsive to modification of serum creatine phosphokinase (CPK) in response to stress than are the normal (A strain) dogs. When not specifically subjected to stress, the serum CPK levels of both strains were highly related to age. Strain differences were also found for the cerebrospinal fluid acetyl cholinesterase activity levels in older animals. Tryptophan loading experiments, conducted in the presence and absence of tranlylcypromine, resulted in no readily observable behavioral modification in either strain, and the response of the cerebrospinal fluid 5-hydroxyindoleacetic acid levels was similar for the 2 strains. (36 ref)—*Journal summary.*

2486. Dement, William C. & Mitler, Merrill M. (Stanford U, Medical School) **An introduction to sleep.** In O. Petre-Quadens & J. D. Schlag (Eds), *Basic sleep mechanisms*. New York, NY: Academic Press, 1974. xix. 459 p. \$23.50.—Presents an overview of sleep, including discussions of the development of the EEG and study of the ascending reticular activating system, rapid eye movement sleep and sleep states, dissociative aspects of sleep and wakefulness, the temporal process in sleep, the psychology of sleep, and new directions in sleep research.

2487. Drewett, R. F. (Science Lab, Durham, England) **The meal patterns of the oestrous cycle and their motivational significance.** *Quarterly Journal of Experimental Psychology*, 1974(Aug), Vol 26(3), 489-494.

—Continuously monitored food intake throughout the estrous cycle of 6 female rats by operant methods. On the night of estrus the size of meals eaten was reduced, and the average intermeal interval was shorter; and even after meals of the same size, estrous Ss returned to eat again more quickly than dioestrous Ss. Results suggest that the way in which ovarian estrogens reduce food intake is by intensifying processes responsible for the short-term satiation of hunger without affecting the motivational processes responsible for its arousal. Signs of motivational arousal at estrus could thus be the result of a self-imposed nutritional deprivation, rather than a direct effect of ovarian hormones on sexual receptivity. (18 ref)—*Journal abstract*.

2488. Ely, Daniel L. & Henry, James P. (U Southern California) **Effects of prolonged social deprivation of murine behavior patterns, blood pressure, and adrenal weight.** *Journal of Comparative & Physiological Psychology*, 1974(Oct), Vol 87(4), 733-740.—Employed a behavioral monitoring technique using magnetic tagging for the prolonged observation of 6 colonies of control CBA mice ( $n = 102$ ) and 3 colonies of CBA mice that were socially isolated for 6 mo ( $n = 51$ ). After 40 days of social interaction in a population cage, several physiological and behavioral abnormalities were observed in the preisolated Ss. The males were hyperaggressive and failed to establish a stable social hierarchy, with a consequent high male mortality. Also, the preisolated Rank-1 males did not patrol their territory effectively in spite of greater overall activity. Phase drifts were found in both preisolated male and female circadian activity rhythms, together with elevated systolic blood pressures and adrenal weights. The females in the preisolated colonies had fewer pregnancies and an increased litter mortality compared with the control females. (20 ref)—*Journal abstract*.

2489. Fischel, Werner. [Problems of storage and synapse processes in the brain.] (Germ) *Psychiatrie, Neurologie und medizinische Psychologie*, 1974(Feb), Vol 26(2), 65-69.—Presents a theory regarding storage of information in the human cortex and basal ganglions. The probable functions of transmitter substances and enzymes are discussed. It is hypothesized that information is stored in the diencephalon in the form of excitatory circuits, motor activities are stored in the basal ganglions, and enzymes somehow relate the two.—K. J. Hariman.

2490. Fowles, Don C. & Schneider, Robert E. (U Iowa) **Effects of epidermal hydration on skin conductance responses and levels.** *Biological Psychology*, 1974, Vol 2(1), 67-77.—Obtained simultaneous recordings of skin conductance responses (SCRs) and levels (SCLs) from 4 sites. A glycol solution at one site produced minimal hydration while agar jelly at another site which was presoaked with water produced maximal hydration. The other 2 sites were recorded with 2 standard electrolytes (agar jelly and Unibase cream). In 2 experiments with 12 female undergraduates in each, rapid and slow recovery SCRs were elicited over a period of 20-25 min. It is concluded that Unibase and agar have very different effects on skin conductance (SC) measurements and that the relationship between SC measures

and hydration is not monotonic. (24 ref)—*Journal abstract*.

2491. Frankignoul, M.; Juchmes, J.; Cession-Fossion, A. & Juchmes-Ferir, A. M. (U Liège, Belgium) **A study of the urinary elimination of catecholamines during effective physical exercises by normal subjects in relation to their anxiety and their aggressivity.** (Fren) *Acta Psychiatrica Belgica*, 1973(May), Vol 73(3), 393-410.—In 18 male students, the urinary elimination of catecholamines during physical exercises on an endless belt was correlated with certain psychological test data on anxiety, emotional instability, and aggressiveness. Results show that anxiety and emotional instability correlated significantly with the amount of noradrenaline excretion during moderate physical exercise. They also correlated with the amount of noradrenaline excretion before, during, or after a moderate or exhausting exercise. No correlations were discovered between catecholamine excretion and aggressiveness. It is suggested that sympathomimetic stimulation induced by physical exercise may be partially influenced by emotional instability (i.e., neurotic trends). (French, Dutch, German, Italian, & Spanish summaries) (23 ref)—*Journal abstract*.

2492. Freund, Kurt; Langevin, Ron & Zajac, Yaroslav. (U Toronto, Ontario, Canada) **Heterosexual aversion in homosexual males: A second experiment.** *British Journal of Psychiatry*, 1974(Aug), Vol 125, 177-180.—Investigated in 2 studies the theory that a fear of female genitals is a factor in male homosexuality. Study 1 showed that 28 homosexual and 48 heterosexual males responded with penile tumescence to pictures of isolated parts of the body of their preferred sex. In Study 2, 20 homosexual males who had been prearoused by pictures of male nudes did not respond to pictures of the vulva, the face, or the breasts of the mature female with penile volume changes different from those in response to sexually neutral slides. However, in terms of ratings on a 4-point scale for disgust, the vulva was rated significantly more disgusting than the breasts, which in turn were rated significantly more disgusting than the face and the sexually neutral pictures.—*Journal summary*.

2493. Gaebelein, Claude J. & Howard, James L. (U North Carolina, Medical School, Chapel Hill) **An improved respiratory system for curarized rats.** *Behavior Research Methods & Instrumentation*, 1974(Jul), Vol 6(4), 427-429.—Describes a system in which peak expired CO<sub>2</sub> is continuously monitored from curarized rats, and an endotracheal tube is used to minimize dead air space. Results of blood gas analyses indicate that values obtained with this system are similar to values in noncurarized rats and that manipulation of expired CO<sub>2</sub> is an effective means of altering blood gas values.

2494. Gattoni, Renata C. & Izquierdo, Ivan. (Ctr de Neurochimie, Strasbourg, France) **The effect of conditioning and pseudoconditioning on RNA metabolism of rat hippocampus and neocortex.** *Behavioral Biology*, 1974(Sep), Vol 12(1), 67-80.—Conducted a study with 120 albino rats as experimental Ss in which, after a 25-min session of conditioned avoidance in a shuttle-box, there was an increase of hippocampal and neocortical RNA concentration, together with an increase of uridine incorporation into cold- and hot-phenol-extractable

hippocampal RNA. 15-min conditioning sessions had no appreciable effect on any of these variables. After either 15 or 25 min of pseudoconditioning there was a fall of hippocampal RNA concentration together with an increase of hippocampal acid ribonuclease activity. In Ss pseudoconditioned for 25 min there was an increase of uridine uptake by both hippocampal and neocortical cold- and hot-phenol-extractable RNA and an enhancement of neocortical acid ribonuclease activity. Results show that changes in brain RNA metabolism caused by both behavioral variables are clearly different. Whereas conditioning seems to stimulate precursor incorporation into hippocampal RNA primarily, pseudoconditioning appears to stimulate first acid ribonuclease activity and RNA labeling only secondarily as a rebound effect both in hippocampus and neocortex. (36 ref)—*Journal abstract*.

2495. Gramsbergen, Albert. (U Hosp, Groningen, Netherlands) **Neuro-ontogeny of sleep in the rat.** In O. Petre-Quadens & J. D. Schlag (Eds), *Basic sleep mechanisms*. New York, NY: Academic Press, 1974. xix, 459 p. \$23.50.—Reviews the background and development of the use of the rat in sleep studies. Research in the development of behavioral states and of behavioral-state-specific EEG patterns in the rat is discussed with relation to the underlying neurophysiological mechanisms of behavior.

2496. Greenblatt, Robert B. (Medical Coll Georgia) **The psychogenic and endocrine aspects of sexual behavior.** *Journal of the American Geriatrics Society*, 1974(Sep), Vol 22(9), 393-396.—Posits that defective sexual adjustment can be managed more easily when there is some understanding of the respective roles of psychogenic and endocrine factors in sexual behavior. Sexual problems are discussed under the headings of maleness and femaleness, sex interest in the female, sexual inadequacy, and sexual gluttony. It is argued that only after differentiation of the psychogenic and endocrine factors can proper therapy be started.—*Journal abstract*.

2497. Hilgard, Josephine R. (Stanford U) **Sequelae to hypnosis.** *International Journal of Clinical & Experimental Hypnosis*, 1974(Oct), Vol 22(4), 281-298.—From a group of 260 undergraduates who had been given the Harvard Group Scale of Hypnotic Susceptibility, Form A, an interview sample of 120 Ss yielded evidence that 15% had some kind of reaction to hypnosis that endured an hour or longer following an individual Form C session subsequent to group hypnosis. If those with short-term reactions lasting from 5 min to 1 hr are added, the number with some lingering effect rises to 31%. Although these symptoms following laboratory hypnosis were not severe, their presence is of importance both for theoretical and practical reasons. Although sequelae to hypnosis were more frequent among those with unpleasant reactions to earlier childhood anesthesia, the difference did not reach statistical significance. (German, French, & Spanish summaries) (23 ref)—*Journal abstract*.

2498. Hucklebride, Frank H. & Nowell, Norman W. (U Hull, England) **Plasma catecholamine response to physical and psychological aspects of fighting in mice.** *Physiology & Behavior*, 1974(Jul), Vol 13(1), 35-40.—Ex-

posed male Tuck TO strain albino mice to a short period of attack by a trained fighter each day for 5 days. On the 6th and subsequent days half of the Ss were exposed merely to the presence of a trained fighter while the other half were exposed to continued physical attack. On Days 6, 7, and 9 Ss were anesthetized immediately after the exposure period, and a blood sample was taken for assay of plasma epinephrine and norepinephrine levels. Plasma epinephrine levels were significantly elevated above the control level on all days. Plasma norepinephrine was also elevated, but the increase reached significance only on Day 9. Plasma catecholamine levels of Ss given previous experience of physical attack but exposed only to the presence of a trained fighter on the day of blood sampling were similar to those of controls on all occasions. It is suggested that, unlike adrenal corticosterone release which is induced by a relatively nonspecific state of hyperalertness or arousal, adrenomedullary epinephrine release is stimulated only under the specific circumstances which, for the mice in the present experiment, were not met by a psychological stimulus. (32 ref)—*Journal abstract*.

2499. Jernstedt, G. C. & Newcomer, Jeffrey P. (Dartmouth Coll) **Blood pressure and pulse wave velocity measurement for operant conditioning of autonomic responding.** *Behavior Research Methods & Instrumentation*, 1974(Jul), Vol 6(4), 393-397.—Describes a system for measuring a correlate of the blood-pressure information obtained with conventional sphygmomanometric systems. The procedure involves the measurement of speed of propagation through the arterial system of the pressure pulse from the heart's contraction. This speed, the pulse wave velocity, is closely related to cuff-derived blood pressure. Many of the problems present with current sphygmomanometric systems are absent with this apparatus and procedure. Data collected from 2 Ss with the apparatus confirm earlier studies which indicate that pulse wave velocity is correlated with sphygmomanometrically measured blood pressure and is a valuable cardiovascular response measure.—*Journal abstract*.

2500. Jouvet, Michel. (School of Medicine, Lyon, France) **The role of monoaminergic neurons in the regulation and function of sleep.** In O. Petre-Quadens & J. D. Schlag (Eds), *Basic sleep mechanisms*. New York, NY: Academic Press, 1974. xix, 459 p. \$23.50.—Discusses empirical evidence which indicates that the sleep-waking cycle appears to be regulated by 2 monoaminergic systems: (a) some serotonergic neurons are responsible for slow-wave sleep and for the priming of paradoxical sleep and (b) some catecholaminergic neurons play a role in cortical arousal and in paradoxical sleep. From the existence of these antagonistic systems, different mechanisms underlying insomnia or decrease of waking are postulated.

2501. Kotses, Harry; Glaus, Kathleen D. & Fisher, Leslie E. (Ohio U) **Effects of subject recruitment procedure on heart rate and skin conductance measures.** *Biological Psychology*, 1974, Vol 2(1), 59-66.—Attempted to determine whether the method employed to recruit Ss influences subsequent autonomic behavior. Skin conductance (SC) and heart rate (HR) measures were recorded from 60 female undergraduates equally

divided among 4 groups: a volunteer group, a pay group, an S-pool group, and a coerced group. Response comparisons were made between groups during a 10-min adaptation period followed by 20, 5-sec bursts of 75-db white noise. Tonic levels and specific response magnitudes were scored for both SC and HR responses, and spontaneous SC activity was evaluated. Differences between the groups were observed in terms of HR and SC basal levels and conclusion that autonomic behavior during a recording session is strongly influenced by subject recruitment procedure.—*Journal abstract.*

2502. Kutscher, Charles L. & Miller, Dean G. (Syracuse U) **Age-dependent polydipsia in the SWR/J mouse.** *Physiology & Behavior*, 1974(Jul), Vol 13(1), 71-79.—In 5 experiments both absolute (ml) and relative water intakes (ml/100 g body weight) increased with age in the SWR/J mouse, and more so in the females than in the males. The well-defined circadian rhythm of drinking in this strain was not altered by the development of polydipsia. In females, the increase in water intakes was accompanied by a decrease in intakes of isotonic and hypertonic NaCl solutions in a single tube test. (21 ref)

2503. Lamprecht, Friedhelm; Matta, Raymond J.; Little, Betsy & Zahn, Theodore P. (NIMH Lab of Clinical Science, Bethesda, MD) **Plasma dopamine-beta-hydroxylase (DBH) activity during the menstrual cycle.** *Psychosomatic Medicine*, 1974(Jul), Vol 36(4), 304-310.—Measured plasma DBH activity in 6 women, 6 days/wk, over a complete menstrual cycle. The Ss rested for ½ hr before giving blood samples. DBH was assayed by a double enzymatic method. DBH activity increased during the follicular phase of the cycle, reaching a peak soon after ovulation, then decreased to a minimum during the premenstrual period. It is concluded that the activity of this enzyme does not seem to parallel the levels of estrogen or progesterone, nor those of peripheral indicators of autonomic activity (e.g., skin conductance and heart rate). However, the Surgency scale on the Nowlis Adjective Check List of Mood showed comparable changes over the cycle. (43 ref)—*Journal abstract.*

2504. Little, Betsy C. & Zahn, Theodore P. (NIMH, Lab of Psychology, Rockville, MD) **Changes in mood and autonomic functioning during the menstrual cycle.** *Psychophysiology*, 1974(Sep), Vol 11(5), 579-590.—The autonomic nervous system activity and mood ratings of 5 18-24 yr old female students and 7 27-42 yr old married women were studied 6 days/wk for a complete menstrual cycle. The daily procedure consisted of a resting period, a series of 5 mild tones, time-estimation (TE) and a reaction-time (RT) trials, and a final resting period. Significant increase in heart rate (HR), respiration rate, and body temperature, and a significant decrease in resting skin conductance (SC) were found during the luteal phase. During the ovulatory phase there were significant increases in autonomic responsivity, as shown by greater amplitude of SC response in the TE and RT situations as well as in faster SC drop-rate and greater HR variability. All measures coincided with a significant peak in feelings of elation and vigor. Significant age effects were that older Ss had higher basal body temperatures, less marked HR variability, and lower levels of SC, particularly in the luteal phase. Results are

discussed in terms of the psychophysiological effects of estrogen and progesterone. (54 ref)—*Journal abstract.*

2505. Lux, H. D. (Max-Planck-Inst for Psychiatry, Munich, Germany) **The kinetics of extracellular potassium: Relation to epileptogenesis.** *Epilepsia*, 1974(Sep), Vol 15(3), 375-393.—Results of an experiment with adult cats and a review of the literature support the hypothesis that an increase in extracellular cortical potassium is a result rather than a cause of epileptiform activity. 2 mechanisms by which potassium might be related to hyperactivity deserve particular attention. The potassium concentration in a small area surrounding a frequently discharging membrane may increase sufficiently to depolarize and finally excite terminal and synaptic regions of afferent fibers. This may explain "synaptic backfiring" and repetitive, recurrent excitation of thalamo-cortical afferent fibers following the primary discharges of interictal paroxysms. Previous experiments show that stimulation of some cortical afferents has a dual effect which consists of a small transient potassium increase followed by a longer lasting decrease in extracellular potassium, possibly by stimulating potassium uptake in terminal regions. Cortical excitability can be particularly high during declining potassium activity. Consequences of this mechanism (e.g., terminal afferent hyperpolarization and an increase in evoked transmitter release) may be considered in view of the considerable synaptic drive that initiates paroxysmal neuronal discharges. (French, German, & Spanish summaries) (35 ref)—*Journal summary.*

2506. Mangan, G. L. (U Oxford, England) **Personality and conditioning: Some personality, cognitive and psychophysiological parameters of classical appetitive (sexual) GSR conditioning.** *Pavlovian Journal of Biological Science*, 1974(Jul-Sep), Vol 9(3), 125-135.—Correlated a number of personality, cognitive, and psychophysiological measures taken from 25 male volunteers with classical (sexual) galvanic skin response acquisition and extinction rates. The data were factor analyzed. The acquisition and extinction factors identified were indexed by the psychophysiological (conditioned and unconditioned stimuli) variables. Cognitive and personality dimensions accounted for a negligible amount of variance. (29 ref)—*Journal abstract.*

2507. Offerhaus, R. E. **Heart rate variability, binary choice capability in psychiatry: Research report, January 1974.** Noordwijkerhout, Holland: "St Bavo" Psychiatric Center, [1974]. 477 p.—Discusses the development, testing, statistical analysis, and evaluation of an automated system for measuring mental stability through heart-rate variability.

2508. Ohman, Arne. (U Uppsala, Sweden) **The relationship between electrodermal and digital vasomotor responses in aversive classical conditioning.** *Biological Psychology*, 1974, Vol 2(1), 17-31.—32 psychology students, exposed to a tone conditioned stimulus (CS), shock unconditioned stimulus (UCS) simple delayed conditioning paradigm with an interstimulus interval of 8 sec, were compared in skin conductance and finger pulse volume responses to a sensitization control group of 32 Ss given unpaired CS-UCS presentations. Magnitude, probability, and amplitude of anticipatory and UCS omission responses were measured. Significant condi-

tioning effects for both these types of response were observed using magnitude and probability measures of the 2 effector systems. Between-S correlations showed significant positive relationships between vasomotor and electrodermal CS responses in the sensitization group and early in conditioning training. Later in training this relationship disappeared, indicating a learned dissociation of the response systems during classical conditioning. Within-S correlations showed that the 2 response systems developed quite independently over trials. (43 ref)—*Journal abstract*.

2509. Pauley, J. Donald; Reite, Martin & Walker, Stephen D. (U Colorado, Medical School, Denver) **An implantable multi-channel biotelemetry system.** *Electroencephalography & Clinical Neurophysiology*, 1974(Aug), Vol 37(2), 153-160.—Describes a totally implantable multichannel biotelemetry system developed for recording physiological information from a monkey infant living unrestrained in its social group. The FM carrier transmits electro-oculogram, electromyogram, heart rate, body temperature, and EEG information. The system would be useful in any situation requiring recording of multivariable physiological data from a completely unrestrained and unhampered experimental subject. (French summary) (17 ref)

2510. Peavler, W. Scott. (U Delaware) **Pupil size, information overload, and performance differences.** *Psychophysiology*, 1974(Sep), Vol 11(5), 559-566.—As a test of the hypothesis that pupil dilation during performance is partially due to a task related anxiety component, pupillary patterns were measured while 16 paid female college students processed digit strings of various lengths for immediate recall. Information overload resulted in a leveling of the dilation pattern which suggested a momentary suspension of processing effort. In addition, significant correlations were observed between individual differences in pupil size and recall performance. (30 ref)—*Journal abstract*.

2511. Peltzman, Philip & Goldstein, Phillip J. (U California, San Francisco) **Intrauterine monitor telephone system.** *Behavior Research Methods & Instrumentation*, 1974(Jul), Vol 6(4), 419-423.—Describes the circuits and configurations of a low-cost custom-designed data system which uses a standard switched telephone line to transmit intrauterine physiologic data obtained during human labor.

2512. Petre-Quadens, Olga & Schlag, John D. (Eds.). (Born-Bunge Research Foundation, Antwerp, Belgium) **Basic sleep mechanisms.** New York, NY: Academic Press, 1974. xix, 459 p. \$23.50.

2513. Petre-Quadens, Olga. (Born-Bunge Research Foundation, Antwerp, Belgium) **Sleep in the human newborn.** In O. Petre-Quadens & J. D. Schlag (Eds.), *Basic sleep mechanisms*. New York, NY: Academic Press, 1974. xix, 459 p. \$23.50.—Discusses data which indicate that quiet and active sleep in newborn infants are not homogeneous entities but that both states should be divided into 2 different stages. On the basis of behavioral differences, active sleep is divided into a primitive sleep state and paradoxical sleep. Quiet-sleep states are differentiated by their EEG characteristics.

2514. Ray, William J. (Pennsylvania State U) **The relationship of locus of control, self-report measures,**

**and feedback to the voluntary control of heart rate.** *Psychophysiology*, 1974(Sep), Vol 11(5), 527-534.—40 male internal and external locus of control undergraduates were instructed to control their heart rate (HR) on 8 trial pairs. Each trial pair consisted of an increase and a decrease HR condition with the order being counterbalanced across Ss. On the last 4 HR control trials, Ss were given visual feedback concerning the time interval between each heart beat via a light panel of 16 check lights. Results show (a) feedback significantly increased the magnitude of the interbeat-interval changes across all Ss; (b) the internal locus of control Ss were able to increase their HR better than the external locus of control Ss and the external locus of control Ss were better able to decrease HR as compared with the internals; and (c) self-report measures demonstrated that external and internal locus of control Ss adopted different strategies for controlling HR, and these strategies were related to previous psychophysiological research not requiring the direct control of HR.—*Journal abstract*.

2515. Robinson, Charles E. (General Motors Corp, Warren, MI) **A chemical model of long-term memory and recall.** *Journal of Biological Psychology*, 1973(Dec), Vol 15(2), 14-17.—Offers a qualitative model in which the memory trace is represented by antigen- and antibody-like molecules localized in cerebral cells analogous to those of the immunological system. The capability of the immunoneurological system is explored to determine whether it can perform the logical operations of memory. Instead of speaking of the logic of neural nets, the logic of F. O. Schmitt's (1964) "molecular nets" is investigated. The possibility that the operations of memory rely on a mechanism not involving alterations in neural circuitry is considered. This mechanism is able to account for recall as well as storage.—*Journal abstract*.

2516. Rzepka, Jan. [Neuropsychological concept of the stages of consciousness.] (Polh) *Roczniki Filozoficzne: Annales de Philosophie*, 1972, Vol 20(4), 5-16.—Supports P. Cauchard's view that consciousness can now be discussed in terms of neuropsychology. On this basis several stages of consciousness within the human psyche can be distinguished which are closely involved with the structural and functional capacity of the human brain. Cauchard's 5 stages of consciousness are defined and discussed from this viewpoint: bioconsciousness, neuroconsciousness, the state of vigilance, attentive consciousness, and cogitative consciousness, the last being a synthesis of all previous stages. (35 ref)—*English summary*.

2517. Schlumpf, Margaret et al. (U Zurich, Switzerland) **A fluorometric micromethod for the simultaneous determination of serotonin, noradrenaline and dopamine in milligram amounts of brain tissue.** *Biochemical Pharmacology*, 1974(Sep), Vol 23(17), 2437-2446.—Describes an assay technique which permits quantification and spectral analysis of milligram amounts of the amines in rat and mouse brain. Protein weight is used as a reference system for concentration calculations. Data from a series of amine determinations on various areas of rat and mouse brain are included. (18 ref)

2518. Shader, Richard L.; Harmatz, Jerold S. & Tammerk, Hedy-Ann. (Massachusetts Mental Health Ctr, Psychopharmacology Lab, Boston) **Menarcheal age and personality: The choice of a statistical test of relationship.** *Psychosomatic Medicine*, 1974(Jul), Vol 36(4), 321-326.—Contends that psychosomatic studies relying upon correlational statistics or assumptions of linearity may be difficult to interpret correctly. For instance, the relationship of menarcheal age to personality may best be conceptualized according to an arbitrary classification which permits an analysis of variance. Although interesting differences were evidenced between 3 purportedly similar samples of young women, no consistent relationship was found between menarcheal age and selected personality measures.—*Journal abstract.*

2519. Sherman, A. & Gebhart, G. F. (U Iowa, Medical School) **Regional levels of GABA and glutamate in mouse brain following exposure to pain.** *Neuropharmacology*, 1974(Jul), Vol 13(7), 673-675.—Conducted a study with 60 male CFI mice of the effects of pain on regional brain levels of  $\gamma$ -aminobutyric acid (GABA) and glutamate. Gas-chromatographic analysis revealed no significant differences in these substrates in subcortical areas. In the cortical areas, pain produced a significant elevation of GABA levels and a small but significant decrease in glutamate levels. Neither of these changes was observed in Ss pretreated with morphine before exposure to pain. Restraint stress failed to produce the same changes. The ratio of GABA to glutamate was a reliable index of exposure to pain.

2520. Solomon, George F.; Amkraut, Alfred A. & Kasper, Phyllis. (California Dept of Mental Health, Fresno) **Immunity, emotions and stress: With special reference to the mechanisms of stress effects on the immune system.** *Psychotherapy & Psychosomatics*, 1974, Vol 23(1-6), 209-217.—Experimental findings suggest that stress and central nervous system lesions affect thymus-derived lymphocytes (T cells) and play a role in cell-cell interaction or the release of mediators from reacting lymphocytes. It is concluded that stress may ultimately be found to affect the macrophage, a hormone-sensitive cell that plays a role in afferent, central, and efferent limbs of the immune system.

2521. Steriade, Mircea; Deschenes, Martin; Wyzinski, Peter & Halle, Jacques-Yves. (U Laval, Faculté de Médecine, Québec, Québec, Canada) **Input-output organization of the motor cortex and its alterations during sleep and waking.** In O. Petre-Quadens & J. D. Schlag (Eds), *Basic sleep mechanisms*. New York, NY: Academic Press, 1974. xix, 459 p. \$23.50.—Discusses data from numerous experiments on various brain structures in the cat and monkey which analyzed alterations in the reactivity of the structures and their mechanisms during different stages of sleep and waking. Research on cell identification, spontaneous firing, evoked discharges, and inhibitory events is reported.

2522. Sterman, Maurice B. & Clemente, Carmine D. (VA Hosp, Sepulveda, CA) **Forebrain mechanisms for the onset of sleep.** In O. Petre-Quadens & J. D. Schlag (Eds), *Basic sleep mechanisms*. New York, NY: Academic Press, 1974. xix, 459 p. \$23.50.—Discusses evidence from the literature concerning the evolution and mechanics of the system whereby activation of elements within the

basal forebrain region can influence ongoing behavior and initiate sleep. Several explanations are considered, and it is proposed that elements in the basal forebrain region exert fundamental influence on other brain structures (possibly the thalamus and midbrain reticular formation), thereby providing for the onset and regulation of normal sleep patterns.

2523. Thompson, Richard W.; Piroch, Joan; Fallen, Dave & Hatton, Dan. (Western Washington State Coll) **A central cholinergic inhibitory system as a basis for tonic immobility (animal hypnosis) in chickens.** *Journal of Comparative & Physiological Psychology*, 1974(Sep), Vol 87(3), 507-512.—4 experiments provided support for the hypothesis that tonic immobility (TI) in chickens, which may be analogous to response suppression in the rat, is a result of fear and is mediated by central cholinergic systems. A total of 124 experimental and 54 control White Leghorn cockerel chicks were the Ss. Exp I established that scopolamine, a central and peripheral acting anticholinergic, will reduce the duration of TI, whereas methylscopolamine, which acts only peripherally, will not. Exp II established a dose-response curve for scopolamine and TI. Exp III demonstrated that scopolamine increased activity and that this increase may be a factor in reducing the duration of TI. Exp IV showed that physostigmine, which blocks acetylcholinesterase and allows longer action of acetylcholine at the synapse, increased the duration of TI. (18 ref)—*Journal abstract.*

2524. Woods, Ralph L. & Greenhouse, Herbert B. (Eds.). **The new world of dreams.** New York, NY: Macmillan, 1974. xix, 439 p. \$12.95.—Presents a collection of 130 papers on what people dream about, the history of dream theories, and scientific research on dreams. Topics include sexual, racial, and cultural differences in dream content; political, military, musical, medical, and other types of dreams; the characteristics of paranormal dreams; physiological and psychological interpretations of dreams; and methods of dream research.

### Genetics

2525. DeFries, J. C.; Hegmann, J. P. & Halcomb, R. A. (U Colorado, Inst for Behavioral Genetics) **Response to 20 generations of selection for open-field activity in mice.** *Behavioral Biology*, 1974(Aug), Vol 11(4), 481-495.—20 generations of directional selection in mice resulted in high and low lines with more than a 6-fold difference in mean activity and virtually nonoverlapping distributions. A correlated response to selection occurred with respect to open-field defecation, low-activity lines having average defecation scores about 3 times higher than those of high-activity lines. Samples of these lines should provide useful research material for investigations by other behavioral biologists.

2526. Dobzhansky, Theodosius. (U California, Davis) **Is genetic diversity compatible with human equality?** *Social Biology*, 1973(Sep), Vol 20(3), 280-288.—Discusses environmentalism and hereditarianism in relation to the role of biology in demonstrating that people are unequal. It is argued that genetic diversity can be made compatible with equality of opportunity.

2527. Inouye, Eiji. (U Tokyo, Medical School, Inst of Brain Research, Japan) **Some considerations in the**

**methodology of human behavior genetics.** *Social Biology*, 1973(Sep), Vol 20(3), 241-245.—Describes some relevant issues in the analysis of genotypes underlying behavioral variation. Pertinent research techniques and their limitations are discussed. (25 ref)

2528. Katzev, Richard D. & Mills, Susan K. (Reed Coll) **Strain differences in avoidance conditioning as a function of the classical CS-US contingency.** *Journal of Comparative & Physiological Psychology*, 1974(Oct), Vol 87(4), 661-671.—Examined rates of shuttle box avoidance responding in 3 strains of rats as a function of classical and instrumental contingencies in 2 experiments. Ss were a total of 126 female albino Fischer, Lewis, and Long-Evans rats. In Exp I, during classical conditioned-stimulus-unconditioned-stimulus (CS-UCS) pairings in the absence of an avoidance contingency, there were large differences between the 3 strains in rates of anticipatory responding to the CS. The same pattern of differences was observed in Exp II when the avoidance contingency was added. None of the instrumental contingencies of CS termination, UCS termination, or the avoidance contingency differentially affected the strains. Classically elicited anticipatory responses and their compatibility with the required avoidance response were viewed as central factors in both the acquisition and maintenance of skeletal avoidance responses. (26 ref)—*Journal abstract*.

2529. Kutscher, Charles L. (Syracuse U) **Strain differences in drinking in inbred mice during ad libitum feeding and food deprivation.** *Physiology & Behavior*, 1974(Jul), Vol 13(1), 63-70.—Results of 2 experimental replications of total food deprivation in SWR/J, CBA/J, C3H/HeJ, DBA/2J, BALB/cJ, A/J, and C57BL/6J mouse strains paralleled those of  $\frac{1}{2}$  normal intake except that in the former condition DBA/2J mice showed a significant decrease in water intake. Food-deprivation polydipsia was seen in some individual SWR/J and CBA/J mice as well as in the C3H/HeJ strain but was very rare in the other 4 strains. (21 ref)

2530. Mills, Susan K. & Katzev, Richard D. (Reed Coll) **Differences in strains of rats during extinction of shuttle box avoidance responding.** *Journal of Comparative & Physiological Psychology*, 1974(Oct), Vol 87(4), 672-680.—In 2 experiments differences between strains of rats in the extinction of shuttle box avoidance responding were examined as a function of the classical conditioned stimulus-unconditioned stimulus (CS-UCS) and instrumental CS termination contingencies. Ss were a total of 68 female albino Fischer, Lewis, and Long-Evans rats. When classical CS-UCS pairings were given on all trials, responding declined somewhat. When this contingency was altered by omitting shock entirely or preventing the pairing of CS and shock, behavior weakened even further. Whereas responding was indistinguishable under both prompt and delayed CS termination during the paired-shock procedure, it was generally higher under prompt CS termination during the no-shock and unpaired-shock procedures. However, the strains differed widely during extinction, with Fischer rats responding more often during the paired and unpaired procedures and Long-Evans rats more often in the no-shock procedure. (22 ref)—*Journal abstract*.

## PSYCHOPHARMACOLOGY AND PHYSIOLOGICAL INTERVENTION

2531. Barker, Lewis M. & Smith, James C. (Baylor U) **A comparison of taste aversions induced by radiation and lithium chloride in CS-US and US-CS paradigms.** *Journal of Comparative & Physiological Psychology*, 1974(Oct), Vol 87(4), 644-654.—Describes 3 experiments with a total of 454 albino male Charles-River rats. Conditioned taste aversions induced by ionizing radiation and lithium chloride (LiCl) were compared with both forward (CS-UCS, conditioned stimulus-unconditioned stimulus) and backward (UCS-CS) conditioning paradigms. Taste aversions were produced when a saccharin CS preceded or followed a 100-r radiation UCS by as much as 6 hrs, but a 2%-of-body-weight, .15-mol LiCl UCS was effective only in CS-UCS pairings. It is argued that the ineffectiveness of an LiCl stimulus in UCS-CS pairings was not attributable to differences in the "strength" of the respective LiCl and radiation doses in that these doses yielded comparable aversions in forward pairings. These results are related to inadequacies of a "sickness" model of taste aversion conditioning. (22 ref)—*Journal abstract*.

2532. Blundell, John E. & Leshem, Micah B. (U Leeds, England) **Central action of anorexic agents: Effects of amphetamine and fenfluramine in rats with lateral hypothalamic lesions.** *European Journal of Pharmacology*, 1974(Sep), Vol 28(1), 81-88.—The effects upon food intake of 3 dose levels of fenfluramine and amphetamine were compared in 25 male hooded rats with bilateral or unilateral lesions of the lateral hypothalamus. 12 Ss served as sham-lesioned controls. Unilateral lesions produced little modulation of drug action, but bilateral lesions brought about opposite effects on amphetamine and fenfluramine anorexia. At 8 wks after operation amphetamine anorexia was significantly diminished in bilaterally lesioned Ss, whereas fenfluramine anorexia was significantly enhanced. Further tests carried out at 14 and 20 wks after operation showed that amphetamine regained its anorexic potency in lesioned Ss, while the enhanced potency of fenfluramine remained. Results are consistent with the belief that these 2 anorexic agents operate through separate sites and mechanisms of action. (21 ref)—*Journal abstract*.

2533. Colasanti, Brenda K.; Craig, Charles R. & Hartman, Elizabeth R. (West Virginia U, Medical Ctr) **Differential effects of pentylenetetrazol on REM sleep in naive and cobalt-epileptic rats.** *Psychopharmacologia*, 1974, Vol 37(2), 151-157.—Produced chronic experimental epilepsy in 5 adult female Sprague-Dawley rats by implanting cobalt wire into the right parietal cortex. 5 Ss treated similarly with glass rods were used as controls. All Ss were simultaneously prepared with permanent cortical and temporalis muscle electrodes for EEG and electromyogram recording. Administration of 15 mg/kg intraperitoneal pentylenetetrazol every 15 min until the appearance of generalized convulsions resulted in the lowering of the chemical seizure threshold expected for the cobalt-treated Ss. EEG recordings collected over the 24-hr period after the 1st injection revealed the presence of a more pronounced suppression of rapid eye movement (REM) sleep in the cobalt-epileptic Ss. This effect

was due to a reduction in the total number of REM sleep episodes. The latencies to REM onset in these Ss were markedly reduced. Results further support the usefulness of cobalt experimental epilepsy in the rat for the study of human seizure disorders in comparison with acute seizure models. (24 ref)—*Journal abstract*.

2534. Costall, B. & Naylor, R. J. (U Bradford, Postgraduate School of Studies in Pharmacology, England) **The importance of the ascending dopaminergic systems to the extrapyramidal and mesolimbic brain areas for the cataleptic action of the neuroleptic and cholinergic agents.** *Neuropharmacology*, 1974(May), Vol 13(5), 353-364.—Assessed the effects on neuroleptic and cholinergic catalepsy in male Sprague-Dawley rats of disruption to catecholaminergic systems by  $\alpha$ -methylparatyrosine and by surgical lesion of the ascending dopaminergic pathways to the extrapyramidal and/or mesolimbic brain areas. Results support a dopaminergic-cholinergic balanced control of catalepsy which involves both extrapyramidal and mesolimbic dopaminergic systems. (32 ref)

2535. Crowley, William R. & Hard, O. Byron. (Rutgers State U, Inst for Animal Behavior, Newark) **Male copulatory behavior induced in female rats by peripheral electrical shock.** *Physiology & Behavior*, 1974(Jul), Vol 13(1), 129-131.—Conducted a study with a total of 30 ovariectomized Sprague-Dawley rats. Peripheral skin shock, like administration of testosterone propionate (TP), increased the display of male copulatory patterns in a limited number of Ss. Shock treatment alone led to moderate rates of mounting with thrusting and display of intromission patterns by 2 of the 3 responding females in this group. TP treatment alone resulted in fewer male responses than did shock treatment and failed to produce the intromission pattern. In 8 Ss in which both TP and shock were given, all showed high rates of male mounting, and all displayed the intromission pattern. Augmentation of nonspecific arousal by peripheral shock appears to facilitate the display of male sexual behavior in females as it does in males. (20 ref)—*Journal abstract*.

2536. Gerlach, J.; Nielson, M. & Randrup, A. (Sct Hans Mental Hosp. Research Lab, Roskilde, Denmark) **Effect of desipramine on rat cortex slices incubated with  $^3\text{H}$ -dopamine.** *Psychopharmacologia*, 1974, Vol 37(4), 341-349.—Results of incubating male SPF Wistar rat cortex slices with  $^3\text{H}$ -dopamine ( $^3\text{H}$ -DA) suggest that desipramine may exert a double mechanism of action on the final step in the noradrenaline biosynthesis: (a) an inhibition of the  $^3\text{H}$ -DA uptake at the level of the noradrenergic cell membrane and (b) an inhibition of the intraneuronal transport of  $^3\text{H}$ -DA to sites where it is converted to  $^3\text{H}$ -noradrenaline, concomitant with an increased intraneuronal  $^3\text{H}$ -DA accumulation. (25 ref)

2537. Gisler, Roland H. (Ciba-Geigy Ltd, Pharmaceuticals Div, Biological Research Lab, Basel, Switzerland) **Stress and the hormonal regulation of the immune response in mice.** *Psychotherapy & Psychosomatics*, 1974, Vol 23(1-6), 197-208.—Exposure of mice to different types of acute stress (acceleration, ether anesthesia, restraint, and overcrowding) or injection of ACTH resulted in an increase of plasma corticosteroid levels. This was associated with a decreased immune reactivity

of their spleen cells. Hypophysectomy of cell donors resulted in a persistent depression of immune responsiveness, which was restored by treatment with somatotrophic hormone. (43 ref)

2538. Haag, Claudia; Jerhoff, Beverly & Kirkpatrick, Jay F. (U Oregon, Medical School) **Ovarian hormones and their role in aggression inhibition among male mice.** *Physiology & Behavior*, 1974(Jul), Vol 13(1), 175-177.—Studied the role of ovarian steroids on aggressiveness in male Swiss white mice, as well as the possibility of interspecies action of mammalian pheromones. Ss were paired and tested for aggressiveness after being smeared with urine from female mice, rats, rabbits, and humans. Urine from intact and sexually mature animals caused a decrement in aggression, while ovariectomized or sexually immature animals did not produce an aggression-inhibiting urine. Urine from ovariectomized animals given injections of estradiol (.1 mg/day) for 5 days, and other estrogens, caused nonaggression. Heavy perfume did not stop aggression, supporting the theory that nonaggression is not the result of simple masking of male odors. Progesterone (1 mg/day for 5 days) was ineffective in inhibiting aggression. It is concluded that an interspecies action of this aggression-inhibiting pheromone appears to exist among mice, rats, rabbits, and to some degree, humans.—*Journal abstract*.

2539. Karpiak, Stephen E.; Rapport, Maurice M. & Bowen, Florry P. (Columbia U, Coll of Physicians & Surgeons) **Immunologically induced behavioral and electrophysiological changes in the rat.** *Neuropsychologia*, 1974(Jul), Vol 12(3), 313-322.—Intraventricular injection into 60 male albino Holtzman rats of antiserum to rat synaptic membrane fraction (anti-SMF) produced recurrent epileptiform activity bilaterally in the caudate nuclei, as well as behavioral alterations, on 2 caudate-mediated tasks involving body orientation. No change was seen on a control task previously reported to be unaltered by caudate lesions. Ss either injected with antiserum to erythrocytes or uninjected had normal EEGs and behavioral responses. It is concluded that antibodies directed against the synaptosome membrane fraction are capable of producing behavioral alterations as well as relatively long-lasting epileptiform activity in rats. (French & German summaries) (44 ref)—*Journal abstract*.

2540. Kettlewell, Neil M.; O'Connell, Michael F. & Berger, Laurence H. (U Montana) **Bilateral nictitating membrane conditioning in rabbits under asymmetrical levels of cutaneous afferent activity.** *Physiology & Behavior*, 1974(Jul), Vol 13(1), 27-33.—Results of appropriate tests in 3 experiments with a total of 42 New Zealand albino rabbits suggest that the 2 eyes did not function independently in learning, regardless of the disparity in cutaneous afferent activity level between them, due to central transfer.

2541. Mendelson, Joseph et al. (U Kansas) **Effects of partial ageusia and anosmia on thresholds for stimulus-bound feeding and drinking in rats.** *Behavioral Biology*, 1974(Sep), Vol 12(1), 1-19.—Results of a number of studies suggest that stimulus-bound feeding and drinking may be dependent upon the oronasal sensations which normally accompany feeding and drinking. 7 adult male albino rats bearing electrodes in the lateral hypothala-

mus were given daily threshold tests for stimulus-bound feeding and drinking in their home cages. After their thresholds stabilized they were subjected to anosmia by suction of the olfactory bulbs, or to partial ageusia by bilateral transection of the lingual, chorda tympani, and lateral branch of the glossopharyngeal nerves. None of these denervations, either separately or in combination, had any consistent effect on the thresholds. In 2 Ss self-stimulation was also studied and was only moderately reduced by the denervations. Implications of these data are discussed in terms of current theories of the mechanisms underlying stimulus-bound behaviors. (22 ref)—*Journal abstract*.

2542. Novin, Donald; Sanderson, John D. & Vanderweele, Dennis A. (U California, Los Angeles) **The effect of isotonic glucose on eating as a function of feeding condition and infusion site.** *Physiology & Behavior*, 1974(Jul), Vol 13(1), 3-7.—Results of a study with 18 female New Zealand rabbits show that duodenal infusions of glucose suppressed feeding only in the free-feeding S, while hepatic-portal infusions suppressed feeding only in the food-deprived S. Both suppressive effects of isotonic glucose were eliminated by bilateral, subdiaphragmatic vagotomy. Results suggest that at least 2 loci can act to reduce eating following glucose intake and that the locus of the effect is dependent upon the feeding condition or nutritional state of the animal. (22 ref)

2543. Rosenberg, Kenneth M. (State U New York, Oswego) **Effects of pre- and postpubertal castration and testosterone on pup-killing behavior in the male rat.** *Physiology & Behavior*, 1974(Jul), Vol 13(1), 159-161.—Evaluated the role of testosterone in the development of pup-killing behavior by manipulating the age at castration and the schedule of replacement therapy with 116 male Purdue-Wistar rats. Within the prepubertal (Day 30) castrates, those which received replacement therapy with testosterone killed more than the placebo-treated Ss. Also, the sham-castrated controls killed more than the Day 30 placebo-treated castrates but did not differ from the testosterone-treated castrates. A similar pattern of results was obtained for the postpubertal (Day 60) castrates except that the castrates which received replacement therapy did not kill more than the placebo-treated Ss. It is concluded that castration either before or after puberty reduced the incidence of pup-killing in adulthood, and replacement therapy with testosterone was sufficient to maintain the behavior.—*Journal abstract*.

2544. Stevenson, I. H. & Turnbull, M. J. (U Dundee, Scotland) **A study of the factors affecting the sleeping time following intracerebroventricular administration of pentobarbitone sodium: Effect of prior administration of centrally active drugs.** *British Journal of Pharmacology*, 1974(Apr), Vol 50(4), 499-511.—Studied factors affecting the duration of anesthesia following intracerebroventricular administration of pentobarbitone to male and female rats. A dose-dependent loss of righting reflexes was produced. Younger rats were the most sensitive to pentobarbitone and females were more sensitive than males. The duration of anesthesia was not affected by induction or inhibition of hepatic drug-metabolizing processes. The effects of pentobarbitone

were prolonged or shortened by central nervous system depressant or stimulant drugs, respectively. Withdrawal of depressant drugs following chronic administration resulted in the development of a cross-tolerance to pentobarbitone.—*Journal abstract*.

2545. Tangri, K. K.; Bhargava, A. K. & Bhargava, K. P. (King George's Medical Coll, Lucknow, India) **Interrelation between monoaminergic and cholinergic mechanisms in the hypothalamic thermoregulatory centre of rabbits.** *Neuropharmacology*, 1974(May), Vol 13(5), 333-346.—Results of observing adult albino rabbits suggest an interaction between adrenergic and nicotinic mechanisms as well as between tryptaminergic and muscarinic systems in hypothalamic thermoregulation for the hyperthermic and hypothermic responses, respectively. (37 ref)

2546. Williams, John M.; Hamilton, Leonard W. & Carlton, Peter L. (Rutgers State U, Rutgers Coll) **Pharmacological and anatomical dissociation of two types of habituation.** *Journal of Comparative & Physiological Psychology*, 1974(Oct), Vol 87(4), 724-732.—Notes that both the exploration of a novel environment (an operant response) and the startle response (an elicited response) share certain functional characteristics (e.g., both response measures wane as a function of exposure and show spontaneous recovery). This commonality has led to the assumption that both measures can be used as an index of a common process of habituation. Results of the present 2 experiments with a total of 96 CFE and 10 Sprague-Dawley male albino rats show that scopolamine (but not methyl scopolamine) greatly impaired habituation of exploration but had no direct effect upon habituation of startle. Medial septal lesions impaired the rate of habituation in both cases. These differential effects imply that (a) contrary to previous conceptualizations, the 2 measures of habituation do not reflect a unitary process; and (b) anticholinergic drugs and medial septal damage do not influence the same neural substrate in terms of behavioral inhibition. (16 ref)—*Journal abstract*.

#### Brain & Electrical Stimulation & Lesions

2547. Almlie, C. Robert & Golden, Gregory T. (Ohio U) **Infant rats: Effects of lateral hypothalamic destruction.** *Physiology & Behavior*, 1974(Jul), Vol 13(1), 81-90.—Male infant Holtzman rat pups lesioned at 7-21 days of age died during Stage II of the lateral hypothalamic recovery syndrome (LHRS). 5 Ss who were lesioned at 25 days recovered, showing an LHRS nearly identical to that of adults, with permanent loss of hydrational controls for thirst and depressed body weight. Recovered Ss had retarded linear body growth, minimal carcass fat, abnormal stomachs, and enlarged adrenal and pituitary glands. (19 ref)

2548. Aronson, Lester R. & Cooper, Madeline L. (American Museum of Natural History, New York, NY) **Olfactory deprivation and mating behavior in sexually experienced male cats.** *Behavioral Biology*, 1974(Aug), Vol 11(4), 459-479.—Compared pre- and postoperative behavior of 8 male cats in Exp I. After bulbectomy there were no decrements in mating behavior; rather, small but significant increases in sexual activity occurred (e.g., increased frequency and duration of intromission and

decreased initial and intromissive mount latencies). Exp II tested the hypothesis that this increase in sexual activity resulted from a decrease in the amount of test time that the desensitized Ss spent in related activities. Sniffing, grooming, and scratching were measured in 5 bulbectomized and 4 sham operates. The same increase in sexual behavior appeared in the bulbectomized Ss as in Exp I. Additionally, there were significant decreases in frequency and duration of sniffing the room and sniffing the female. The sham operates remained unchanged. The probability that complete anosmia was achieved in these experiments was supported by detailed histological examination. Results are discussed in relation to the pronounced decrements following bulbectomy in several species of rodents. (60 ref)—*Journal abstract*.

2549. Ball, Gordon G.; Micco, David J. & Berntson, Gary G. (Rockefeller U, New York, NY) **Cerebellar stimulation in the rat: Complex stimulation-bound oral behaviors and self-stimulation.** *Physiology & Behavior*, 1974(Jul), Vol 13(1), 123-127.—Carried out an extensive stimulation-mapping study of 328 cerebellar sites in 82 male Sprague-Dawley rats. It was found that complex oral behaviors (eating, grooming, and gnawing) as well as self-stimulation could be obtained from a region including the rostro-ventral anterior lobe vermis, fastigial nucleus, and superior cerebellar peduncle. The behaviors, differing in several respects from hypothalamic-elicited behaviors, appeared only in the presence of the appropriate goal object, thus ruling out simple motor automatisms. Results suggest that the traditional view of the cerebellar role of improving the coordination of individual muscle movements and posture may need to be expanded. The cerebellum may act to facilitate and coordinate complex chains of species-specific behavior patterns. (28 ref)—*Journal abstract*.

2550. Bass, Robert W. (Brown U) **Detection of electrical brain stimulation at hypothalamic and septal sites in rats.** *Journal of Comparative & Physiological Psychology*, 1974(Sep), Vol 87(3), 458-465.—Studied the detectability of electrical brain stimulation in 4 male Charles River CD strain rats using a "yes/no" psychophysical procedure. For each S, either septal or hypothalamic stimulation served as the discriminative stimulus, and stimulation at the other site served as the reinforcement for all correct responses. Detection thresholds were determined for 5 different train durations. The psychometric functions obtained were S-shaped and highly reminiscent of those seen in classical psychophysics. Threshold intensity was a monotonically decreasing function of train duration in the range 30-240 msec. Expressed in terms of log charge per stimulus presentation, threshold was a linear function of log stimulus duration in this range. Results demonstrate partial temporal summation. (19 ref)—*Journal abstract*.

2551. Blass, Elliott M.; Nussbaum, Alan I. & Hanson, Donald G. (Johns Hopkins U) **Septal hyperdipsia: Specific enhancement of drinking to angiotensin in rats.** *Journal of Comparative & Physiological Psychology*, 1974(Sep), Vol 87(3), 422-439.—Conducted 3 experiments with a total of 126 hyperdipsic and 123 normal female Sprague-Dawley rats. Ss made hyperdipsic by destruction of the septal nuclei drank more water than normal Ss to thirst stimuli considered to be mediated, at

least in part, by angiotensin. Specifically, they drank more than normal Ss to caval ligation, hypotension induced by the  $\beta$ -adrenergic agonist isoproterenol, intraperitoneal injections of renin, and intravenous infusions of angiotensin. Overdrinking was enhanced by nephrectomy when renin or angiotensin were introduced exogenously, but nephrectomy reduced drinking to hypotension. Septal hyperdipsic Ss drank more water than normal Ss when polyethylene glycol was delivered intraperitoneally but not subcutaneously. They did not drink more to cellular dehydration produced by the intravenous or intragastric injection of hypertonic saline or sucrose. The contributions of the septum to angiotensin-mediated drinking and to nonhomeostatic determinants of drinking are discussed, as are the possible mechanisms controlling drinking to intravascular depletions. (38 ref)—*Journal abstract*.

2552. Brunelli, Marcello; Magni, Franco; Moruzzi, Giuseppe & Musumeci, Daniela. (U Pisa, Inst of Physiology, Italy) **Effects of pontine stimulations on sleep and waking behaviors of the pigeon.** In O. Petre-Quadens & J. D. Schlag (Eds), *Basic sleep mechanisms*. New York, NY: Academic Press, 1974. xix, 459 p. \$23.50.

2553. Carson, Virginia G. & Wenzel, Bernice M. (Chapman Coll) **Telemetered heart rates of immunosympathectomized and/or adrenal-medullectomized mice during behavioral tasks.** *Journal of Comparative & Physiological Psychology*, 1974(Sep), Vol 87(3), 449-457.—Studied the effects of immunosympathectomy and/or adrenal medullectomy in Swiss-Webster mice in the open field and in each S's home environment. Heart rates (HRs) were monitored via telemetry. Mobility and defecation in the open field were not significantly affected by either immunosympathectomy or adrenal medullectomy. Adrenal medullectomy did affect the relationships between HR and mobility or defecation. The negative correlation between HR and activity of 23 adrenal-intact (AI) Ss became insignificantly positive for 17 adrenal-medullectomized (AM) Ss. Defecating control AI Ss had high HRs, and defecating immunosympathectomized (IS) AM Ss had low HRs. The IS Ss were able to achieve HRs as high as those of controls (>800 bpm) when stressed, but these HRs became significantly lower than those of controls in a short time. (23 ref)—*Journal abstract*.

2554. Cohen, Ira L. & Mendelson, Joseph. (Rutgers State U, New Brunswick) **Schedule-induced drinking with food, but not ICS, reinforcement.** *Behavioral Biology*, 1974(Sep), Vol 12(1), 21-29.—Studied the development of schedule-induced drinking in 5 male hooded rats trained to respond on variable-interval schedules in which food and intracranial stimulation served as reinforcers. The typical postreinforcement schedule-induced drinking pattern appeared after food rewards but not after intracranial-stimulation rewards. Results help to specify the boundary conditions within which schedule-induced drinking will emerge.—*Journal abstract*.

2555. Crawshaw, Larry I. & Carlisle, Harry J. (John B. Pierce Foundation Lab, New Haven, CT) **Thermoregulatory effects of electrical brain stimulation.** *Journal of Comparative & Physiological Psychology*, 1974(Sep), Vol

87(3), 440-448.—Electrical stimulation of various loci in the hypothalamus, septum, or rostral forebrain of 23 female Sprague-Dawley rats frequently produced an increase, and occasionally a decrease, in body temperature. Stimulation while the Ss were working for radiant heat reinforcement in a cold environment rarely affected the rate of response or reinforcement. There was no consistent relation between the magnitude of the temperature change induced by electrical stimulation and other behaviors such as grooming, huddling, and self-stimulation. Thus, electrical stimulation effected changes in body temperature but did not affect motivational components of temperature regulation. (25 ref)—*Journal abstract*.

2556. Dean, P. & Weiskrantz, L. (U Oxford, England) **Loss of preoperative habits in rhesus monkeys with inferotemporal lesions: Recognition failure or relearning deficit?** *Neuropsychologia*, 1974(Jul), Vol 12(3), 299-311.—Measured *Encountertapes*, a 9 rhesus monkeys with inferotemporal lesions on a series of object discrimination tasks given 1 day to 4 wks before operation. Data were analyzed in 2 ways—either by considering only the 1st retention trial on each task or by comparing rates of relearning with new learning after the operation. The aim of both analyses was to demonstrate the existence of a retention defect independent of slower postoperative learning. The 2 measures agreed in or no signs of retention were evident either 1 or 4 wks after inferotemporal removal. Results are consistent with the operation producing a modality-specific retrograde amnesia. (French & German summaries) (23 ref)—*Journal abstract*.

2557. Edwards, Michael A. & Adams, David B. (Wesleyan U) **Role of midbrain central gray in pain-induced defensive boxing of rats.** *Physiology & Behavior*, 1974(Jul), Vol 13(1), 113-121.—Pain-induced defensive boxing behavior in 12 male DA agouti rats and 7 of their F<sub>1</sub> hybrids was impaired or abolished by lesions of the midbrain central gray at the level of the superior colliculus. Lesions which left part of this region intact along with its lateral and dorsal connections did not produce boxing deficits despite destruction of anterior, posterior, or ventral connections. 12 other Ss were controls. On the basis of these data and comparison to data on affective defense in the cat, it is suggested that this region may function as a modal command system or a patterning mechanism independent of the forebrain for pain-induced defensive boxing in the rat and affective defense in the cat. The central gray was necessary for freezing and escape behaviors as well as pain-induced defensive boxing, which leads to speculation about its role in committing the S to one or another of these 3 alternative responses to pain or threat. (26 ref)—*Journal abstract*.

2558. Franklin, K. B. & Herberg, L. J. (Inst of Neurology, London, England) **Ventromedial syndrome: The rat's "finickiness" results from the obesity, not from the lesions.** *Journal of Comparative & Physiological Psychology*, 1974(Sep), Vol 87(3), 410-414.—6 obese, finicky female hooded rats with lesions of the hypothalamic ventromedial nucleus (VMH) and 7 sham-lesioned controls progressively lost weight on an unpalatable diet until at a critical basal level they increased their

intake to prevent further loss of weight. The critical basal body weight was similar in both groups and showed no change in the controls when they were subsequently lesioned and retested. At weight levels below the critical basal level the feeding behavior of lesioned and unlesioned Ss was similar, and finickiness could be demonstrated only when body weight exceeded it. The basal level bore no relation to the plateau level of body weight reached by Ss on a free diet. Suggestions that the VMH excites as well as inhibits feeding seem untenable in view of the failure of VMH lesions to impair defense of body weight in the nonobese rat. (17 ref)—*Journal abstract*.

2559. Gonzalez, Larry P. & Maule, William F. (U Houston) **Transfer of stress-induced effects—a critique.** *Journal of Biological Psychology*, 1973(Dec), Vol 15(2), 30.—Refutes results of P. V. Laird et al's (see PA, Vol 50:8408) study on transfer of stress-induced effects in goldfish, since much of their support was derived from unpublished results. While it is important to determine behavioral limits within which the transfer phenomenon exists, premature publication of any new test of these limits is unjustified.

2560. Hutton, Robert S.; Wenzel, Bernice M.; Baker, Theodore & Homuth, Martha. (U Washington) **Two-way avoidance learning in pigeons after olfactory nerve section.** *Physiology & Behavior*, 1974(Jul), Vol 13(1), 57-62.—In 2 experiments 15 adult homing pigeons with bilaterally sectioned olfactory nerves reached criterion performance in a 2-way shock avoidance sooner than did 13 sham-operated Ss and 14 unoperated controls. The conditioned stimulus (CS) was red light added to a background of green houselight; the unconditioned stimulus (UCS) was footshock, and the avoidance response was the act of moving from one compartment to another. In Exp I intertrial responses delayed CS onset. In Exp II intertrial interval was fixed, and intertrial responses had no effect. Differences in rate of extinction were not significant, but the lesioned groups showed a consistent tendency toward a slower rate. Heart rate was recorded from each S while partially restrained during simulated trials in which the CS was presented, but UCS was not. Data suggest that the experimental Ss were less likely to habituate to the CS. (18 ref)—*Journal abstract*.

2561. Jacquet, Yasuko F. & Lajtha, Abel. (New York State Research Inst for Neurochemistry & Drug Addiction, Ward's Island) **Paradoxical effects after microinjection of morphine in the periaqueductal gray matter in the rat.** *Science*, 1974(Sep), Vol 185(4156), 1055-1057.—Paradoxical, concurrent hyper-, and hyporeactivity of a profound nature to specific stimuli occurred when 10 µg morphine was microinjected bilaterally into the periaqueductal gray matter of the rat brain. Both effects at this site were dose-dependent. The hyperreactivity (to previously neutral auditory and visual stimuli) was obtained only with intracerebrally injected morphine and never with intraperitoneally injected morphine or with other opiates administered either way. Rapid tolerance to toxic doses of morphine developed at this site, as well as cross-tolerance of the hyporeactivity to painful stimuli between routes (intracerebral to intraperitoneal) of morphine administration. Both the hyper- and hyporeactivity were fully reversible by intracerebral

injection of naloxone in the periaqueductal gray. Thus, the periaqueductal gray appears to be a major pathway for morphine action. (15 ref)—*Journal abstract*.

2562. Julien, R. M. & Laxer, K. D. (U California, Medical School, Irvine) **Cerebellar responses to penicillin-induced cerebral cortical epileptiform discharge.** *Electroencephalography & Clinical Neurophysiology*, 1974(Aug), Vol 37(2), 123-132.—In 50 locally anesthetized, paralyzed cats with penicillin-induced foci in sensorimotor cortex, simultaneous microelectrode recordings were made in the cerebellum and in the anterior sigmoid gyrus near the site of the penicillin injection. Cerebellar recordings were made from Purkinje cells (P-cells) and from cells located in the dentate nucleus. Data reveal distinct patterns of cerebellar responsiveness to the developing epileptogenic focus. Within 15 min after penicillin injection, high frequency (100-140 cyc/sec) P-cell discharges were evoked throughout the cerebellar cortex by focal "spike" activity of the cerebral cortex. These P-cell discharges outlasted short (2-10 sec) epileptiform bursts; however, if P-cell discharges ceased during periods of sustained focal discharge, prolonged (up to 60 sec) convulsive episodes developed and became synchronous and maximal in both cerebral hemispheres. P-cell discharge did not reappear until after termination of the seizure. In the dentate nucleus, epileptiform activity evoked complex patterns of cellular activity. In contrast to the P-cells, cells in the dentate nucleus discharged at high frequencies during prolonged epileptiform episodes. The proposed role of the cerebellum in the control of cortical excitability is discussed. (French summary) (35 ref)—*Journal summary*.

2563. Kaelber, William W. & Mitchell, Clifford L. (U Iowa) **The presence and absence of the "tegmental response" in the cat: A lesion and degeneration comparison after stimulation studies.** *Behavioral Biology*, 1974(Sep), Vol 12(1), 143-148.—The caudal distribution of axons undergoing degeneration after lesions produced through a single, chronically implanted bipolar electrode was compared in 2 groups of cats (totaling 26) that had been trained to escape stimulation of the mesencephalic or most rostral pontine tegmentum. This investigation was prompted by the fact that all but 1 S in which the mesodiencephalic junction was involved by the stimulating electrode exhibited a tegmental response—a consistent and pronounced flexion of the head, body, and extremities, concave to the side stimulated—whereas this was absent in the ponto-mesencephalic group. Both groups had considerable degeneration along the central tegmental fasciculus but, whereas the red nucleus, nucleus pontis centralis superior, and the predorsal fascicle had heavy axonal destruction in the Ss with the tegmental response, there was practically none in those without such responses.—*Journal abstract*.

2564. Kapp, Bruce S.; Kaufman, Jeffrey D. & Repole, Dennis A. (U Vermont) **Hippocampal stimulation and memory: Effects of stimulation parameters and reinforcement magnitude.** *Physiology & Behavior*, 1974(Jul), Vol 13(1), 47-55.—Examined the extent to which postconditioning stimulation-induced hippocampal seizure activity is a necessary condition for the production of retrograde amnesia in rats. In 5 experiments a total of 105 male Sprague-Dawley rats received dorsal hippo-

campal stimulation at several different current intensities immediately following 1-trial passive avoidance conditioning. 34 Ss served as controls. Results suggest that current intensities far in excess of those which produce hippocampal seizure activity were a necessary condition for the production of retrograde amnesia. Reinforcement magnitude was not a significant variable at hippocampal seizure threshold current intensities. Current intensities insufficient for the production of retrograde amnesia, but sufficient for the production of dorsal hippocampal seizure activity, produced a spread of seizure activity into the ventral hippocampal formation. Results suggest that caution be exercised in attributing a role to the hippocampus in memory consolidation processes in the rat. (22 ref)—*Journal abstract*.

2565. Kolb, Bryan. (Pennsylvania State U, Animal Behavior Lab) **Social behavior of rats with chronic prefrontal lesions.** *Journal of Comparative & Physiological Psychology*, 1974(Sep), Vol 87(3), 466-474.—Studied the social behavior of adult male Wistar albino rats in 6 experiments following medial frontal ( $n = 20$ ) or orbital frontal ( $n = 14$ ) lesions. 34 Ss served as controls. While both lesion groups showed transient increases in emotionality, only the Ss with orbital frontal lesions showed changes in social behavior. They were more aggressive in male-male aggression and shock-induced aggression but failed to differ from controls on tests of gregariousness, territorial aggression, and predatory aggression. Data may provide support for C. M. Leonard's (1969) suggestion that the orbital frontal cortex of rats and monkeys is homologous. (27 ref)—*Journal abstract*.

2566. Kolb, Bryan; Nonneman, Arthur J. & Singh, R. K. (U Western Ontario, London, Canada) **Double dissociation of spatial impairments and perseveration following selective prefrontal lesions in rats.** *Journal of Comparative & Physiological Psychology*, 1974(Oct), Vol 87(4), 772-780.—Reports results of 2 experiments with 27 male Wistar and 27 male hooded Long-Evans rats. Lesions to the medial frontal cortex produced severe deficits on spatial reversal learning and on delayed response, while lesions of the orbital frontal cortex produced perseverative response tendencies on a differential reinforcement of low rates 20-sec schedule and on barpressing extinction. Results are strikingly similar to those resulting from dorsolateral frontal and orbital frontal lesions, respectively, in rhesus monkeys. (24 ref)—*Journal abstract*.

2567. Krikstone, Barry J. & Levitt, Robert A. (St Michael's Coll) **Comparisons between drinking induced by water deprivation or chemical stimulation.** *Behavioral Biology*, 1974(Aug), Vol 11(4), 547-559.—Compared the motivation to ingest water produced by 15 or 23 hrs of water deprivation or by chemical injection of carbachol or angiotensin into the brain in male Long-Evans rats. Comparisons were made of tolerance for quinine adulteration of the water (Exp I with 50 Ss), of lick rate on a variable interval schedule (Exp II with 52 Ss), and of barpressing rate on a variable interval schedule (Exp III with 52 Ss). When Ss that had been water deprived and Ss that had been chemically stimulated drank similar volumes of water, they behaved similarly in other thirst-motivated tasks. Failure to equate the volume drunk in a similar consummatory situation probably accounts for

previously reported differences in performance on other thirst-motivated tasks. (20 ref)—*Journal abstract.*

2568. **Lamprecht, Friedhelm et al.** (NIMH Lab of Clinical Science, Bethesda, MD) **Serum dopamine-beta-hydroxylase (DBH) activity and blood pressure response of rat strains to shock-induced fighting.** *Psychosomatic Medicine*, 1974(Jul), Vol 36(4), 298-303.—Conducted an experiment with 250 rats from 4 genetically normotensive strains and 2 strains with a genetic predisposition to develop hypertension. Significant differences were found among the strains in terms of both blood pressure response to shock-induced fighting and peripheral sympathetic nerve activity, as reflected in serum DBH activity. In addition, strains with low levels of serum DBH activity did not exhibit significant blood pressure changes after fighting, whereas strains with high serum DBH levels showed significant falls in blood pressure. It is concluded that serum DBH levels are a useful index of sympathetic nerve function in that they are related to hemodynamic responses to stress. (16 ref)—*Journal abstract.*

2569. **Miczek, Klaus A.; Brykczynski, Terry & Grossman, Sebastian P.** (Carnegie-Mellon U) **Differential effects of lesions in the amygdala, periamygdaloid cortex, and stria terminalis on aggressive behaviors in rats.** *Journal of Comparative & Physiological Psychology*, 1974(Oct), Vol 87(4), 760-771.—In 3 experiments, with a total of 113 male albino Sprague-Dawley rats, it was found that small lesions in the periamygdaloid cortex, cortical amygdaloid nucleus, or bed nuclei of the stria terminalis reduced or eliminated attacks and signs of dominance in fights which were generated by isolated housing and the omission of food reward. The same lesions had little or no effect on pain-induced or reflexive "fighting" or on mouse-killing. Small lesions in the lateral or central amygdaloid nuclei significantly inhibited pain-induced "aggression," but did not modify attack behavior or dominance in fights that occurred in situations not involving painful stimulation. These lesions also did not alter mouse-killing behavior. Results suggest that the periamygdaloid cortex and cortical amygdaloid nucleus, as well as the stria terminalis, may be part of a neural system which influences intraspecies aggression in male rats. (39 ref)—*Journal abstract.*

2570. **Miller, Ralph R.; Ott, Clifford A.; Berk, Alvin M. & Springer, Alan D.** (Brooklyn Coll, City U New York) **Appetitive memory restoration after electroconvulsive shock in the rat.** *Journal of Comparative & Physiological Psychology*, 1974(Oct), Vol 87(4), 717-723.—Previous studies have demonstrated that noncontingent aversive stimulation can produce recovery from amnesia induced by electroconvulsive shock (ECS) for passive avoidance training. The present 2 experiments with a total of 120 male albino Sprague-Dawley rats examined the stimulus characteristics necessary to restore appetitive memory after ECS. In a 1-trial appetitive task, posttraining ECS proved to be an effective amnesic agent. Memory was restored by (a) 1 60-sec exposure to the appetitive reinforcer outside of the training situation and (b) 3 135-sec exposures to the training apparatus in the absence of the reinforcer. These results indicate that the "reminder effect" is not a consequence of generalization of learning that occurs

during the reminder treatment. Data suggest that stimuli specific to the training situation are potential agents for reversing experimental amnesia. It is concluded that this class of recovery agents is better characterized as reminders than as stressors. A mechanism for recovery from experimental amnesia is proposed. (17 ref)—*Journal abstract.*

2571. **Moruzzi, Giuseppe.** (U Pisa, Inst of Physiology, Italy) **Neural mechanisms of the sleep-waking cycle.** In O. Petre-Quadens & J. D. Schlag (Eds), *Basic sleep mechanisms*. New York, NY: Academic Press, 1974. xix, 459 p. \$23.50.—Presents results of experiments on chronic decerebrate and *cerveau isolé* cats which lead to the conclusion that 2 ascending systems arising in the brain stem—the activating reticular system and the deactivating structures of the lower brain stem—modulate cerebral activities which are also reciprocally organized and able to cause a sleep-waking cycle.

2572. **Nachman, Marvin & Ashe, John H.** (U California, Riverside) **Effects of basolateral amygdala lesions on neophobia, learned taste aversions, and sodium appetite in rats.** *Journal of Comparative & Physiological Psychology*, 1974(Oct), Vol 87(4), 622-643.—Reports results of 8 experiments with a total of 327 male Sprague-Dawley rats. Lesions to the basolateral amygdala produced permanent impairment in Ss' ability to learn a taste aversion. When lesions were administered after Ss had already learned an aversion, there was complete loss of the aversion. Ss with amygdala lesions also had a diminished neophobic response when presented with a novel solution and showed a more generalized aversion to water after a sucrose-sickness trial. Whether a solution was novel or familiar affected the learning of an aversion for controls more than it did for Ss with amygdala lesions. Ss with amygdala damage also showed less sodium appetite than normals in response to desoxycorticosterone acetate injections. These results indicate that rats with amygdala lesions have deficits in recognizing the significance of stimuli. (49 ref)—*Journal abstract.*

2573. **Nonneman, Arthur J. & Kolb, Bryan E.** (U Kentucky) **Lesions of hippocampus or prefrontal cortex alter species-typical behaviors in the cat.** *Behavioral Biology*, 1974(Sep), Vol 12(1), 41-54.—8 mongrel cats with lesions of hippocampus or of prefrontal cortex showed changes in 2 experiments in several species-typical behavior patterns. Both hippocampal and frontal operates were submissive to 8 intact controls during social pairings, but the nature of the submissive behavior differed qualitatively in the 2 groups. Ss with hippocampal ablation showed little affective response to social threat or to a threatening cat model, whereas Ss with frontal lesions responded appropriately to threat. Both lesions affected some components of the Ss' response pattern to the odor of cat urine. Hippocampal removal enhanced the occurrence of the gape response and retarded intersession habituation of the sniff and nose-lick components. Frontal cortex ablation eliminated the gape response but did not affect habituation. Results support the hypothesis that both hippocampus and prefrontal cortex are involved in the assessment of the biological significance of environmental stimuli.—*Journal abstract.*

2574. Norman, Robert J. et al. (U California) **Classical eyeblink conditioning in the bilaterally hemispherectomized cat.** *Experimental Neurology*, 1974(Sep), Vol 44(3), 363-380.—Studied the classically conditioned eyeblink response in 9 cats with various forebrain lesions. The most extreme of these were 3 chronically prepared diencephalic Ss in which the central hemispheres were separated from the thalamus and removed bilaterally. Conditioning was established using a 400-msec duration auditory conditioning stimulus (CS) followed by a brief cutaneous shock to the eyelid as the reinforcing stimulus. The electromyogram (EMG) was recorded bipolarly from orbicularis oculi, and integrated EMG for the CS interval served as an objective measure of conditioned response magnitude. All of the experimental Ss learned a conditioned blink response which appeared qualitatively similar to that obtained in the 4 controls. All preparations showed extinction when reinforcement was discontinued, discriminated between 2 stimuli within the same sensory modality, showed discrimination reversal, and retained the acquired response over days. Results indicate that telencephalic structures are not necessary for the acquisition and maintenance of a classically conditioned response. (25 ref)—*Journal abstract*.

2575. Numan, Michael. (Rutgers State U, Inst of Animal Behavior, Newark) **Medial preoptic area and maternal behavior in the female rat.** *Journal of Comparative & Physiological Psychology*, 1974(Oct), Vol 87(4), 746-759.—Reports results of 3 experiments with a total of 92 postpartum lactating female Wistar rats. Medial preoptic area lesions severely disrupted maternal behavior, whereas lesions of the stria terminalis and medial cortico-hypothalamic tract knife cuts were without effect. Parasagittal knife cuts that severed the mediolateral connections of the preoptic-anterior hypothalamic continuum also severely disrupted maternal behavior. The lesions and knife cuts which disrupted maternal behavior had no effect on female sexual behavior. It is concluded that the medial preoptic area and its lateral connections are essential for the normal display of maternal behavior in postpartum lactating female rats. Evidence also indicates that independent neural mechanisms for the control of maternal behavior and sexual behavior exist within the hypothalamus of female rats. (46 ref)—*Journal abstract*.

2576. Ohi, Shuzo. (Tokyo U of Education, Japan) **[The effect of actinomycin D on avoidance learning in goldfish: I.]** (Japn) *Annual of Animal Psychology*, 1972, Vol 22(2), 61-70.—Investigated the role of ribonucleic acid (RNA) synthesis in the acquisition of an avoidance task. 129 goldfish received intracranial injection of actinomycin D either 30 min before or immediately after a session of 2-way avoidance training. The injection and drug training were repeated every other day. The drug interfered with the rate of acquisition after 3 injections of 2 µg, or after 4 injections of 1 or .5 µg. The drug had no effect on general activity at these dosages. The interference of actinomycin with the avoidance response suggests that the synthesis of RNA is necessary for learning. (English summary) (20 ref)—*S. Nakajima*.

2577. Rose, Mitchell D. (Tufts U) **Pain-reducing properties of rewarding electrical brain stimulation in the rat.**

*Journal of Comparative & Physiological Psychology*, 1974 (Oct), Vol 87(4), 720-728.—In 4 experiments with 13 male Charles River rats, electrodes implanted along the medial forebrain bundle were screened for self-stimulation and stimulation-induced analgesia. Analgesia was defined by changes in unconditioned or escape responses to footshock. Almost all electrodes produced both self-stimulation and analgesia or neither. Thresholds for the 2 effects were highly correlated. Brain stimulation produced an analgesic aftereffect comparable in duration with the poststimulation enhancement of performance in self-stimulation (the priming effect). The refractory period of neurons underlying analgesia, assessed by behavioral means, was similar to that previously found for the priming effect in self-stimulation (.8-1.2 msec). Results suggest a common neural system mediating electrical analgesia and the priming effect of self-stimulation. (25 ref)—*Journal abstract*.

2578. Rudy, Thomas A. (U Wisconsin, School of Pharmacy, Madison) **A versatile restraining device for the unanesthetized cat.** *Physiology & Behavior*, 1974(Jul), Vol 13(1), 167-170.—Describes a device which prevents the cat from reaching the head and neck regions with its paws and which restrains the body in a relatively fixed position. Free air flow to most of the animal's body is maintained, and the animal is able to assume normal feline postures, to perform operant responses with its forepaws, and to eat and drink while in the restraining device. The device should prove particularly useful in those studies requiring chemical or electrical stimulation of the brain in the awake cat.

2579. Schwartz, Myrna & Telitelbaum, Phillip. (U Pennsylvania) **Dissociation between learning and remembering in rats with lesions in the lateral hypothalamus.** *Journal of Comparative & Physiological Psychology*, 1974(Sep), Vol 87(3), 384-398.—10 female Sprague-Dawley albino rats which had recovered regulatory feeding after lesions in the lateral hypothalamus (LH) were tested for retention of a taste aversion acquired prior to the lesions. All 10 Ss retained the aversion. 2 of these Ss provided evidence that preoperative memory can be lost following lesions but subsequently recovers. The same 10 recovered LH-lesioned Ss were exposed to a taste-aversion training procedure identical to that used prior to the lesion, but with novel flavors. 7 of the 10 failed to acquire the new taste aversion. 3 additional Ss served as unoperated controls. It is concluded that rats with lateral hypothalamic damage are thus capable of remembering previously learned taste aversions but unable to learn new ones. (17 ref)—*Journal abstract*.

2580. Thompson, Robert & Ledoux, Joseph E. (Louisiana State U) **Common brain regions essential for the expression of learned and instinctive visual habits in the albino rat.** *Bulletin of the Psychonomic Society*, 1974(Aug), Vol 4(2-A), 78-80.—In an experiment with a total of 61 male albino Wistar rats, different groups were subjected to discrete lesions in 1 of 10 different areas of the brain which have previously been found to be implicated in retention of learned brightness and pattern discrimination habits. When tested for the rodent's predictable (instinctive) preference for the dark, 8 groups showed deficient preference scores and 2 showed preference scores comparable to that of the control

group. Those groups with lesions of brain structures not implicated in retention of learned visual discrimination habits exhibited normal preference scores. Data suggest the existence of common as well as diverse neuroanatomical substrata necessary for the expression of both classes of adaptive behavior.—*Journal abstract.*

(U California, Mental Retardation Program, NPI, Los Angeles) **Role of the thalamus in sleep control: Sleep-wakefulness studies in chronic diencephalic and athalamic cats.** In O. Petre-Quadens & J. D. Schlag (Eds), *Basic sleep mechanisms*. New York, NY: Academic Press, 1974. xix, 459 p. \$23.50.

2582. Wise, Roy A. & James, Linda. (Sir George Williams U, Montreal, Quebec, Canada) **Rat ethanol intake: Suppression by intracranial surgery and facilitation by intracranial stimulation.** *Psychopharmacologia*, 1974, Vol 37(2), 179-184.—Implantation of stimulating electrodes into the lateral hypothalamus of 32 male Wistar rats suppressed subsequent home-cage ethanol intake. Lateral hypothalamic stimulation overcame this influence, returning Ss to the levels of 16 unimplanted, unstimulated controls. The effects of surgery were temporary; the 8 implanted controls reached the intake levels of the 8 stimulated and unimplanted controls after 60 days of ethanol exposure. Controls that were given pentobarbital or ether anesthesia without surgical insult drank as much as unimplanted controls.—*Journal abstract.*

### Drug Effects

2583. ———. **Cocaine.** *PharmChem Newsletter*, 1972, Vol 1(3), 3-4.—Presents a 3-mo summary of 50 drug samples found on the street in Georgia, Illinois, and New England. A description of the pharmacology, history, and effects of cocaine is also presented.

2584. ———. **Diazepam.** *PharmChem Newsletter*, 1973, Vol 2(3), 1, 4.—Describes the pharmacology, hazards and adverse effects, possibilities of addiction, and metabolism of diazepam (Valium). A table of 182 substances including descriptions of actual and alleged contents, origins, date of 1st reported appearance, and street prices is included for the month of March 1973.

2585. ———. **Mescaline.** *PharmChem Newsletter*, 1972, Vol 1(4), 1-3.—Describes the pharmacology, behavioral, physiological, and psychological effects, mechanisms and metabolism, and history and uses of mescaline. A table of 65 substances recently appearing on the illicit market with descriptions of alleged and actual contents, origins, and street prices is included.

2586. ———. **Methadone.** *PharmChem Newsletter*, 1972, Vol 1(5), 1-2.—Describes the history, pharmacology, effects, and uses of methadone. A table of 75 substances recently appearing on the illicit drug market with descriptions of actual and alleged contents, origins, and street prices is included.

2587. ———. **Methaqualone—A Dr. Jekyll and Mr. Hyde?** *PharmChem Newsletter*, 1973, Vol 2(1), 1, 4.—Describes the history, effects, and dangers of methaqualone (Quaalude). A table of 261 substances appearing on the illicit drug market during a 4-mo period in 1973 with descriptions of the alleged and actual contents,

origin, date of 1st appearance, and street price is included.

2588. ———. **MDA.** *National Clearinghouse for Drug Abuse Information, Report Series*, 1973(Oct), Vol 25(1), 10 p.—Describes the history, chemistry, pharmacology, and effects of 3,4-methylenedioxymphetamine (MDA), a hallucinogen which is chemically related to mescaline and amphetamine. A review of 20 articles is presented to show potential benefits and dangers of MDA. (20 ref)

2589. ———. **Psilocybin demand creates new drug deception.** *PharmChem Newsletter*, 1973, Vol 2(2), 1, 4.—Describes the pharmacology, history, effects, and uses of psilocybin. A 4-mo summary of analyses of 410 drug samples currently appearing on the illicit drug market is presented, and a table of 149 substances with descriptions of alleged and actual contents, origin, date of 1st appearance, and street prices is included.

2590. Abel, Ernest L. (New York State Dept of Mental Hygiene, Research Inst on Alcoholism, Buffalo) **Drugs and behavior: A primer in neuropsychopharmacology.** New York, NY: John Wiley & Sons, 1974; ix, 229 p.—Discusses the basic principles of pharmacology in the context of the nervous system and of drug receptor theory and emphasizes the factors that affect drug action. The structural and functional bases of behavior are explored; mechanisms of cellular drug transport, drug effects, antagonism, tolerance, and physical dependence on drugs are described; and genetic factors, sex differences, and age biological rhythms are emphasized. (21 p ref)

2591. Agmo, A. J. (U Uppsala, Inst of Zoophysiology, Sweden) **The relation between sexual behavior and seminal fructose in intact and castrated rabbits.** *Physiology & Behavior*, 1974(Jul), Vol 13(1), 41-45.—Studied seminal fructose and sexual behavior in 5 intact and 12 castrated, testosterone treated rabbits. Both seminal fructose and the intensity of sexual behavior increased after testosterone treatment. The dose-response relations were quite different for the 2 variables. A dose of 7.5 mg testosterone propionate (TP) injected subcutaneously every 3rd day during the experiment restored the sexual behavior to precastration levels, whereas a dose of 30 mg TP was insufficient to give seminal fructose concentrations comparable to those in the intact Ss. There were no correlations between sexual behavior and seminal fructose in castrated or intact Ss. Data seem to support the idea of different hormonal mechanisms controlling sexual behavior and activity in the accessory sexual glands. (21 ref)—*Journal abstract.*

2592. Agué, C. (Sandoz Ltd, Basle, Switzerland) **Cardiovascular variables, skin conductance and time estimation: Changes after the administration of small doses of nicotine.** *Psychopharmacologia*, 1974, Vol 37(2), 109-125.—3 tobacco cigarettes with known content of nicotine and 1 lettuce-leaf cigarette were smoked by 24 paid, male medical students who were habitual smokers; at different times of day and at fixed rates of smoking. Changes in psychophysiological parameters were automatically recorded during the 60 min which followed smoking. Heart rate and forearm blood flow increases were dose dependent, the latter occurring only after smoking at the fast rate. Skin vasoconstriction, as

measured by decreases in temperature, was more reactive to environmental stimuli than to drug effects. Significant increases in skin conductance levels lasting throughout the experimental session occurred immediately after smoking. Diphasic effects of nicotine were obtained with the 2 largest doses at different times of day. This finding is discussed in relation to possible unspecific nicotine effects upon a preexisting level of activation. Nicotine did not influence subjective time estimates. This is discussed in terms of disruption of the timing task and a gradual reorganization towards presmoking estimates. (32 ref)—*Journal abstract*.

2593. Ahtee, Liisa. (U Helsinki, Finland) **Catalepsy and stereotypies in rats treated with methadone: Relation to striatal dopamine.** *European Journal of Pharmacology*, 1974(Jul), Vol 27(2), 221-230.—Administered methadone subcutaneously for 8 wks to male Wistar rats, inducing catalepsy and stereotyped behavior. Acute administration produced catalepsy but not stereotypies in control Ss. After 5 wks of chronic administration methadone still produced dose-dependent catalepsy. All Ss showed stereotypies which appeared after 4-5 days and were at their maximum after 5-6 wks of chronic administration. Naloxone administered before methadone completely prevented the appearance of catalepsy and stereotypy. Reserpine pretreatment prevented the appearance of stereotypies. 2 hr after methadone, the striatal homovanillic acid concentration of Ss receiving methadone for 8 wks was increased to about the same degree as in control Ss receiving the same dose of methadone as a single injection. Results suggest that the primary effect of methadone is catalepsy which causes increased dopamine production as a compensatory mechanism. The additional dopamine is a probable cause of stereotyped behavior in Ss which were partially tolerant to the cataleptic effect of methadone. (35 ref)—*Journal abstract*.

2594. Algeri, Sergio & Cerletti, Chiara. (Istituto di Ricerche Farmacologiche "Mario Negri," Milan, Italy) **Effects of l-dopa administration on the serotonergic system in rat brain: Correlation between levels of l-dopa accumulated in the brain and depletion of serotonin and tryptophan.** *European Journal of Pharmacology*, 1974(Jul), Vol 27(2), 191-197.—Following administration of an acute intraperitoneal (ip) dose of 200 mg/kg levodopa in Sprague-Dawley rats, the concentration of this aminoacid increased rapidly in whole brain to 10 µg/g, and this new level was maintained for at least 20 min. At the same time, there was a significant depletion of serotonin (5HT) which was correlated with the level of dopa in the brain. The level of brain tryptophan (TP) also decreased. If levodopa was given orally at a dose of 250 mg/kg, an increased concentration of this drug in the brain was still seen, but the levels reached were 20 times less than the levels obtained after ip administration. In this situation the brain levels of 5HT and TP were unchanged. The chronic administration of levodopa did not cause accumulation of the drug in the brain nor did it affect the concentrations of 5HT and TP. (28 ref)—*Journal abstract*.

2595. Alsum, P. & Goy, R. W. (Wisconsin Regional Primate Research Ctr, Madison) **Actions of esters of testosterone, dihydrotestosterone, or estradiol on**

**sexual behavior in castrated male guinea pigs.** *Hormones & Behavior*, 1974(Sep), Vol 5(3), 207-217.—Treated 46 prepuberally castrated male guinea pigs in adulthood with estradiol benzoate, testosterone propionate, dihydrotestosterone propionate, or corn oil (vehicle control). Both corn oil and estradiol benzoate were ineffective in augmenting or inducing any aspect of adult male sexual behavior. Dihydrotestosterone propionate and testosterone propionate were both effective in establishing the complete male sexual behavior pattern, although they differed in the manner in which they affected specific components. Ss treated with testosterone propionate showed more nonintromissive but not more intromissive mounts than Ss treated with dihydrotestosterone propionate. The average frequency of thrusts/intromission was greater for Ss treated with dihydrotestosterone propionate than for Ss treated with testosterone propionate. (26 ref)—*Journal abstract*.

2596. Andén, Nils-Erik & Strömbom, Ulf. (U Göteborg, Sweden) **Adrenergic receptor blocking agents: Effects on central noradrenaline and dopamine receptors and on motor activity.** *Psychopharmacologia*, 1974, Vol 38(2), 91-103.—Phenoxybenzamine, but not phentolamine or propranolol, blocked central noradrenaline receptors in flexor reflex experiments on male Sprague-Dawley rat spinal cords using clonidine. None of these 3 drugs blocked dopamine receptors in experiments on turning of unilaterally striatectomized rats induced by apomorphine. The α-methyltyrosine-induced disappearance of noradrenaline in the central nervous system of rats and of female NMRI mice was accelerated by phenoxybenzamine at doses related to the functional changes. The disappearance of dopamine was decelerated by phenoxybenzamine, but not by phentolamine or propranolol. The effects of the adrenergic receptor blocking agents on motor activity were studied in a model in which clonidine potentiated the activation induced by apomorphine in reserpine-treated mice. Phentolamine and propranolol reduced the stimulation seen both after apomorphine alone and in combination with clonidine. Phentolamine blocked the peripheral effects of clonidine but did not markedly diminish the effects of clonidine induced by the receptor stimulants. Phenoxybenzamine blocked the clonidine-induced potentiation without interfering with the apomorphine-induced stimulation and can thus be used as a blocking agent of central and peripheral noradrenaline receptors in behavioral experiments. (31 ref)—*Journal abstract*.

2597. Archer, John. (U Sussex, School of Biological Sciences, Brighton, England) **The effects of testosterone on the distractibility of chicks by irrelevant and novel stimuli.** *Animal Behaviour*, 1974(May), Vol 22(2), 397-404.—Trained a total of 60 male Warren Sex-link chicks in 2 experiments to run for a food reward in a runway; half the sample were subsequently injected intramuscularly with testosterone enanthate (Ts) and half with the oil vehicle only (Cs). 2 days later, Ss were given a series of tests in the runway to investigate the effect which changing the color or pattern of either the runway walls or the food dish had on their times to run and feed continuously. Results demonstrate that Ts showed more pronounced decreases in running times when the color or pattern of the food dish was changed.

but Cs showed more pronounced decreases in running times following changes in the walls of the runway. Findings support predictions derived from R. J. Andrew's (1972) hypothesis that testosterone increases persistence of activated search specifications.—*Journal abstract.*

2598. Banerjee, Utpal. (U Malaya, Faculty of Medicine, Kuala Lumpur, Malaysia) **Modification of the isolation-induced abnormal behavior in male Wistar rats by destructive manipulation of the central monoaminergic systems.** *Behavioral Biology*, 1974(Aug), Vol 11(4), 573-579.—Isolated male Wistar rats exhibited muricide ( $n = 22$ ), friendly ( $n = 36$ ), or indifferent ( $n = 36$ ) behavior when exposed to mice. Ss from each category were treated with  $\alpha$ -methyl-p-tyrosine, 6-hydroxydopamine, or electrolytic lesions of the midbrain-raphé nucleus and reexposed to mice at regular intervals. 36 aggregated controls were treated similarly. All 3 treatments rendered the indifferent Ss more reactive and aggressive after 6-hydroxydopamine and midbrain-raphé lesion. Friendly Ss became less reactive posttreatment, then recovered, but never exhibited aggression. Muricide Ss were virtually unaffected by any treatment. 12 controls showed aggressive and muricide behavior both after 6-hydroxydopamine and midbrain-raphé lesions. (16 ref)—*Journal abstract.*

2599. Banerjee, Utpal. (U Malaya, Faculty of Medicine, Kuala Lumpur, Malaysia) **Programmed self-administration of potentially addictive drugs in young rats and its effects on learning.** *Psychopharmacologia*, 1974, Vol 38(2), 111-124.—122 young white Norwegian rats were trained in a conditioned avoidance (CAR) or a maze-learning paradigm, under the chronic influence of 9 potentially addictive drugs administered in drinking water in a step-up dosage schedule. Ss' growth was variably impeded by all drugs except ethanol and meprobamate (MPB). Compared to the water controls, acquisition of CAR was accelerated by amphetamine (AMP) and medazepam (MZP), significantly delayed by morphine and pentobarbitone (PNB), and marginally affected by ethanol, phenobarbitone (PHB), flurazepam (FZP), nitrazepam, and MPB. Except for AMP, PHB, and MPB, performance generally improved upon withdrawal of the drugs. Extinction of the acquired CAR was achieved in all but 2 groups during drug-treatment but not in the drug-free state. In the Y-maze experiment, the rate of maze learning was generally impeded by all drugs relative to that of the water controls. Ethanol-, FZP-, MZP-, and morphine-treated Ss exhibited significant impairment upon withdrawal of the drugs; the AMP-, MPB-, and PNB-treated Ss improved in maze-performance during withdrawal. (40 ref)—*Journal abstract.*

2600. Baskin, S. L.; Hinkamp, D. L.; Marquis, W. J. & Tilson, H. A. (Medical Coll Pennsylvania, Philadelphia) **Effects of taurine on psychomotor activity in the rat.** *Neuropharmacology*, 1974(Jul), Vol 13(7), 591-594.—Conducted a series of experiments with a total of 52 male Sprague-Dawley rats in which taurine, a proposed neurotransmitter, had distinctive effects on psychomotor activity. Intraperitoneal injection of taurine caused a dose-dependent depression of habituated psychomotor activity. Intraventricular administration of taurine result-

ed in a depression of psychomotor activity peaking at approximately 20 min, followed by a brief stimulation in activity occurring at 60-70 min after infusion. Larger doses of taurine prolonged the depressant effect and appeared to mask the following stimulant effect. The behavioral properties observed for taurine suggest a functional role for taurine in the central nervous system. (18 ref)—*Journal abstract.*

2601. Beach, Frank A. & Orndoff, Robert K. (U California, Berkeley) **Variation in the responsiveness of female rats to ovarian hormones as a function of preceding hormonal deprivation.** *Hormones & Behavior*, 1974(Sep), Vol 5(3), 201-205.—Tested 11 ovariectomized female Long-Evans rats for the display of lordosis behavior 30 days after gonadectomy. Ss were then tested 7, 14, 21, and 81 days later following estrogen and progesterone treatment. Finally, on Day 88 Ss were tested after either estrogen and progesterone treatment or after progesterone alone. The response to estrogen and progesterone treatment was limited on the 1st test and on the 5th test, which occurred after 2 mo without hormone treatment. When hormone treatment was repeated at 7-day intervals (Tests 2-4) the tendency to show lordosis increased markedly. On the final test Ss given both hormones showed lordosis, while those which received only progesterone did not. Data suggest that the response to estrogen decreases after estrogen deprivation.—*Journal abstract.*

2602. Beaton, J. M.; LeBlanc, A. E. & Webster, C. D. (U Alabama, Birmingham) **The effects of *d*-amphetamine on the inter-response times of rats and guinea-pigs on a modified Sidman discriminated avoidance schedule.** *Psychopharmacologia*, 1974, Vol 37(3), 199-203.—Trained 4 male Wistar rats and 4 male guinea pigs under a barpress avoidance schedule. The guinea pigs acquired the avoidance response more rapidly than the rats. Bovet-Gatti dextroamphetamine profiles were similar in both species in that there was a significant increase in responding before the stimulus light and click were presented, and the interresponse times of efficient responses were shorter. Data indicate that guinea pigs may be better Ss than rats for psychopharmacological work involving discriminated barpress avoidance behavior.—*Journal abstract.*

2603. Benton, David; Kyriacou, Charalambos P.; Rick, John T. & Taberner, Peter V. (University Coll Wales, Swansea) **Behavioural interactions between imidazoleacetic acid and  $\gamma$ -hydroxybutyric acid in rats and mice.** *European Journal of Pharmacology*, 1974(Aug), Vol 27(3), 288-293.—Injected Wistar albino rats and LACG mice intraperitoneally with hypnotic doses of imidazoleacetic acid (IMA) and  $\gamma$ -hydroxybutyric acid (GHB) either singly or in combination. GHB, a normal metabolite of GABA in the brain, was the more potent drug in the rat and IMA, a normal metabolite of histamine, the more potent drug in the mouse. IMA given 30 min prior to the GHB produced a potentiation of the hypnotic effects in the rat. When the drugs were given either simultaneously or in the reverse order, no potentiation was observed. Since the potentiation was specific to the rat, it is proposed that the effect may reflect differences in the activities of histamine-metabolizing enzymes between the 2 species. (25 ref)—*Journal abstract.*

2604. Bert, J. & Balzamo, E. (National Ctr for Scientific Research, Inst of Neurophysiology & Psychophysiology, Marseille, France) [Differential effects of parachlorophenylalanine on sleep in two primates, *Papio papio* and *Papio hamadryas*.] (Fren) *Electroencephalography & Clinical Neurophysiology*, 1974(Aug), Vol 37(2), 161-166.—Found that parachlorophenylalanine (PCPA) induced a decrease of sleep duration in 6 *Papio papio* and 6 *Papio hamadryas*, but that this effect was partly different in the 2 species of baboons. The difference seemed to be related to normal sleep characteristics proper to each species. This suggests a biochemical specificity in the functioning of anatomically identical nervous structures. However, 5-hydroxytryptophan effects were identical in the 2 species. In both species, PCPA did not have the same effect upon the various stages of slow-wave sleep. Stage 2 was particularly modified, the mean duration of its episodes increasing while their number remained unchanged. This effect suggests an inhibitory influence of the serotonergic system upon the catecholaminergic arousal system.—*English summary*.

2605. Blend, M. J. & Benefiel, W. L. (Mt Carmel Mercy Hosp, Div of Nuclear Medicine, Detroit, MI) The effects of cyproterone acetate on luteinizing hormone (LH) and follicle stimulating hormone (FSH) serum levels in the male rat. *Michigan Academician*, 1974(Spr), Vol 6(4), 389-398.—Studied the effects of the anti-androgen cyproterone acetate (Cyp-A) at a low oral dosage on LH and FSH in 40 intact and 40 castrated male rats. Ss were fed 10 ppm Cyp-A in dry meal for 56 days; 20 castrate and 20 intact animals did not differ from controls in weight, well-being, or food consumption. Ss were sacrificed, and blood samples, pituitary, prostate, testes, liver, and kidneys taken. No significant differences were found among groups in relative weights of organs other than decreased prostate in castrate groups. LH levels were significantly and FSH nonsignificantly higher in all groups other than intact controls. Results are contrasted with earlier findings that much higher doses of Cyp-A reduced levels of FSH and sometimes LH.—*R. D. Kahoe*.

2606. Blumenthal, David S.; Burke, Robert & Shapiro, Arthur K. (New York Hosp—Cornell U Medical Ctr, Payne Whitney Clinic, NY) The validity of "identical matching placebos." *Archives of General Psychiatry*, 1974(Aug), Vol 31(2), 214-215.—Conducted a laboratory simulation of the double-blind clinical study in which inactive control drugs are described as "identical matching placebos." For 5 of 6 drug categories, 52 Ss (medical students and school staff members) simulating Es or patients significantly differentiated active drug from placebo based on physical characteristics of the medications. Many of the identical matching placebos were not in fact identical but were different from the active drug in physical properties such as texture, color, and thickness. Results suggest that the assumption that "identical matching placebos" as used in a study should be tested by preliminary comparison of the placebo with the active drug. It is recommended that active drug and control be administered as capsules, that research assistants be minimally aware of the experimental design of the study, that the Federal Drug Administration or

National Institutes of Health formulate standard capsules for use in controlled clinical evaluation studies, and that the placebo contain active ingredients to mimic the side effects of the active drug.—*Journal abstract*.

2607. Boggan, William O. & Schlesinger, Kurt. (Medical U South Carolina) Pharmacological correlates of ECS induced disruption of a passive avoidance task in mice. *Behavioral Biology*, 1974(Sep), Vol 12(1), 127-134.—Examined the effects on C57BL/6J mice of various intraperitoneally administered drugs (reserpine, 5-hydroxytryptophan, levodopa, physostigmine, atropine, amino-oxyacetic acid, and thiosemicarbazide) known to alter different putative neurotransmitter systems, on electroconvulsive shock (ECS) disruption of the performance of a passive avoidance task. Reserpine, physostigmine, and amino-oxyacetic acid decreased the effectiveness of ECS while 5-hydroxytryptophan and levodopa increased the effectiveness of ECS. Data are interpreted as a drug-induced alteration of memory consolidation processes and/or a drug-ECS interaction. (33 ref) —*Journal abstract*.

2608. Bradley, P. B. & Dray, A. (Medical School, Birmingham, England) Morphine and neurotransmitter substances: microiontophoretic study in the rat brain stem. *British Journal of Pharmacology*, 1974(Jan), Vol 50(1), 47-56.—Reports that microiontophoretically-applied morphine either increases or decreases activity of single neurones in the brain stem of urethane-anesthetized rats. These effects were often powerful, but occurred with different time courses. Desensitization to morphine excitation was often observed after repeated and prolonged applications; this may be related to tolerance observed after chronic morphine administrations in intact animals. No desensitization was found with inhibition of neurones by morphine. Excitation of microiontophoretically-applied noradrenaline, 5-hydroxytryptamine, or acetylcholine was often reduced by applications of morphine but was sometimes potentiated. Neither the inhibitory effects of these neurotransmitters or the excitation of neurones by glutamate for homocysteic acid was modified by morphine. *Journal abstract*.

2609. Broverman, Donald M.; Klaiber, Edward L.; Vogel, William & Kobayashi, Yutaka. (Worcester State Hosp, Research Inst of Life Sciences, MA) Short-term versus long-term effects of adrenal hormones on behaviors. *Psychological Bulletin*, 1974(Oct), Vol 81(10), 672-694.—Hypothesizes that short-term exposures to stress facilitate performances of serially repetitive, overlearned tasks and impair performances of perceptual restructuring tasks, while long-term exposures to stress produce the opposite behavioral effects. These effects are attributed, in part, to the length of exposure of the central nervous system to stress-elicited adrenal hormones (epinephrine and cortisol). Short-term exposures are believed to induce states of central adrenergic dominance that favor performances of serially repetitive, overlearned tasks at the expense of perceptual restructuring tasks. Longer exposures are thought to result in a shift to central cholinergic dominance that favors the opposite pattern of performances. A physiological model is presented that accounts for the shift from central adrenergic to central cholinergic dominance. Experimental procedures derived from the model promote the

reversal of some of the behavioral and physiological effects of a long-term stressor. (5 p ref)—*Journal abstract.*

2610. Bürki, Hans R. et al. (Research Inst Wanda, Sandoz Research Unit, Berne, Switzerland) **Effect of single and repeated administration of clozapine on the metabolism of dopamine and noradrenaline in the brain of the rat.** *European Journal of Pharmacology*, 1974(Jul), Vol 27(2), 180-190. —Compared the action of clozapine on the synthesis and disappearance of catecholamines in male RAC rat brain with that of 4 neuroleptics: haloperidol, chlorpromazine, loxapine, and HF-2046. Clozapine enhanced the dopamine (DA) content of the striatum while the typical neuroleptics decreased the DA level, probably as a consequence of turnover stimulation. Upon repeated administration, the DA-enhancing effect of clozapine became more pronounced while the DA turnover stimulation caused by neuroleptics diminished. Single or repeated doses of clozapine did not interfere with DA turnover stimulation induced by the administration of haloperidol or loxapine. It is thought that clozapine stimulated the synthesis of striatal DA more strongly than its disappearance, and that it did not primarily block DA receptors. Clozapine stimulated the turnover of noradrenaline in the brain stem, but this effect was markedly diminished upon repeated administration. (39 ref)—*Journal abstract.*

2611. Carey, R. J. & Goodall, E. B. (VA Hosp, Syracuse, NY) **A conditioned taste aversion induced by  $\alpha$ -methyl-*p*-tyrosine.** *Neuropharmacology*, 1974(Jul), Vol 13(7), 595-600. —In Exp I 20 male Sprague-Dawley rats treated with either 450 mg/kg or 100 mg/kg injections of  $\alpha$ -methyl-*p*-tyrosine ( $\alpha$ -MPT) spaced 12 hrs apart acquired an aversion to a .1% saccharin solution in a 2-bottle choice with water. Ss treated with either saline or 4 injections of 100 mg/kg of  $\alpha$ -MPT without saccharin present exhibited a complete preference for the saccharin solution. In Exp II with 20 Ss, the saccharin aversion induced by the 4 100 mg/kg  $\alpha$ -MPT injection procedure persisted after telencephalic norepinephrine had returned to normal levels. Thus,  $\alpha$ -MPT was found to be a highly effective drug for inducing a taste aversion at dose levels which did not produce obvious signs of toxicity. —*Journal abstract.*

2612. Carlier, E.; Nowaczyk, T.; Valatx, J. L. & Juvancz, P. (U Claude-Bernard, Lyon-Cedex, France) **[The development of sleep in newborn rat separated from its mother: Effects of  $\alpha$ -methyl-dopa.]** (Fren) *Psychopharmacologia*, 1974, Vol 37(3), 205-215. —Studied the development of paradoxical sleep (PS) in 41 neonatal rats separated from their mothers 3-21 days after birth and fed artificially by a chronically implanted gastric catheter. Results show that in these Ss the development of PS differed quantitatively from Ss remaining with their mothers, the daily duration of PS being decreased. The PS-suppressing effects of  $\alpha$ -methyl-dopa were studied after single or multiple intragastric, subcutaneous, or intraperitoneal injections. The maximal daily decrease in PS (90%) occurred with 2250 mg/kg doses.  $\alpha$ -Methyl-dopa in the newborn produced permanent waking with increased motor activity but without change in the heart rate. From the 9th-10th days an initial transient sedation with a marked bradycardia was produced (2-3 hrs), followed by a secondary selective

suppression of PS for 12-15 hrs. (20 ref)—*English abstract.*

2613. Champoux, Ronald & Upton, L. George. (U Michigan, Speech Clinic) **Oral motor nerve block: Some implications for research in speech.** *Journal of Speech & Hearing Disorders*, 1974(Aug), Vol 39(3), 344-349. —Discusses the effects of a bilateral hypoglossal nerve block on speech and possible implications of the technique for research in speech pathology. The risks involved are essentially the same as those associated with sensory nerve blocks when performed by someone well-trained in the administration of regional anesthesia. (18 ref)

2614. Chesher, G. B. & Jackson, D. M. (U Sydney, NSW, Australia) **Anticonvulsant effects of cannabinoids in mice: Drug interactions within cannabinoids and cannabinoid interactions with phenytoin.** *Psychopharmacologia*, 1974, Vol 37(3), 255-264. —Tested the anticonvulsant activity of orally administered  $\Delta^9$ -tetrahydrocannabinol (THC),  $\Delta^9$ -THC, cannabidiol (CBD), and cannabinol (CBN) in male QS and C57 strain mice utilizing electroshock and chemoshock methods. THC afforded no protection from chemoshock seizures and was effective against electroshock only in high doses (160-200 mg/kg). CBD and CBN were without effect in both tests. Administration of THC significantly potentiated the anticonvulsant effectiveness of phenytoin against electroshock seizures, and this effect was further potentiated by the concurrent administration of CBD. While the potentiation of phenytoin by THC (50 mg/kg) was of the order of 1.5 times, the combination of THC and CBD (each 50 mg/kg) produced a 4-fold potentiation. Neither within-cannabinoid interaction nor cannabinoid potentiation of phenobarbitone effectiveness could be demonstrated in chemoshock tests. The mechanism of the cannabinoid facilitation of phenytoin is unknown, but it possibly involves activity at central nervous system level rather than being a metabolic interaction. This drug interaction may have potential clinical significance. (25 ref)—*Journal abstract.*

2615. Chesher, G. B.; Jackson, D. M. & Stormes, G. A. (U Sydney, NSW, Australia) **Interaction of cannabis and general anaesthetic agents in mice.** *British Journal of Pharmacology*, 1974(Apr), Vol 50(4), 593-599. —Reports that a cannabis extract, equivalent to 10 mg/kg of  $\Delta^9$ -tetrahydrocannabinol (THC), prolonged both pentobarbitone and ether anesthesia in mice when administered 20 min before the anesthetic. After 8 daily doses of the extract, an acute dose of cannabis still significantly potentiated the duration of anesthesia induced by the pentobarbitone but not that induced by the ether. Acute doses of cannabidiol,  $\Delta^9$ -THC and  $\Delta^9$ -THC (10 mg/kg or higher), significantly prolonged the duration of pentobarbitone anesthesia, while cannabinol was inactive. Various combinations of cannabinoids showed that  $\Delta^9$ -THC and cannabidiol had additive effects, while cannabinol showed a consistent tendency to reduce the prolongation of anesthesia produced by the other cannabinoids. A 2nd cannabis extract, with a different cannabinoid ratio, was inactive. Based on pretreatments with drugs known to affect catecholaminergic and serotonergic systems, it is concluded that cannabis-induced prolongation of pentobarbitone anesthesia is not

mediated by an effect on these systems.—*Journal abstract.*

2616. Chin, Jane H.; Crankshaw, D. P. & Kendig, Joan J. (Stanford U, Medical School) **Changes in the dorsal root potential with diazepam and with the analgesics aspirin, nitrous oxide, morphine and meperidine.** *Neuropharmacology*, 1974(May), Vol 13(5), 305-316.—Compared the effects of 4 analgesics and a tranquilizing muscle relaxant on the peripherally evoked negative dorsal root potential (DR V) in 47 intact and anesthetized cats. Diazepam, nitrous oxide, aspirin, and meperidine increased the area of DR V. Anesthesia with nitrous oxide blocked the effects of the analgesics but not those of diazepam. Spinal transection reduced the effects of both diazepam and morphine. The actions of the drugs on the positive DR VI component were similar to those on DR V except for the effects of aspirin and of small doses of morphine. Results support a possible role for enhancement of presynaptic inhibition in the actions of the drugs tested. They also emphasize the necessity for caution in interpreting drug studies performed in the presence of anesthetic agents or spinalization. (26 ref)—*Journal abstract.*

2617. Cicero, T. J.; Meyer, E. R. & Bell, R. D. (Washington U, Medical School) **Effects of phenoxybenzamine on the narcotic withdrawal syndrome in the rat.** *Neuropharmacology*, 1974(Jul), Vol 13(7), 601-607.—Determined the effects of various  $\alpha$ - and  $\beta$ -adrenergic blocking agents on the narcotic withdrawal syndrome in a series of experiments with male Holtzman rats implanted with morphine pellets.  $\alpha$ -Adrenergic blockers caused a dose-dependent suppression of 2 behavioral responses characteristic of precipitated narcotic withdrawal in the rat: diarrhea and, most notably, wet-dog shakes. The  $\beta$ -adrenergic blocker, propranolol, did not effect the expression of the narcotic withdrawal syndrome. The effects of  $\alpha$ -blockers on withdrawal behavior did not appear to be due to the slight degree of sedation produced by the highest doses of the drugs, because pentobarbital and promethazine, in doses sufficient to induce marked sedation and anesthesia, did not decrease the severity of withdrawal. In fact, pentobarbital appeared to exacerbate the abstinence syndrome. (18 ref)—*Journal abstract.*

2618. Clineschmidt, Bradley V.; McGuffin, Jodie C. & Werner, A. Barbara. (Merck Inst for Therapeutic Research, West Point, NY) **Role of monoamines in the anorexigenic actions of fenfluramine, amphetamine and p-chloromethamphetamine.** *European Journal of Pharmacology*, 1974(Aug), Vol 27(3), 313-323.—Female CFE Carworth rats pretreated intraperitoneally with methergoline, cyproheptadine, cinanserin, methysergide, or chlorimipramine were partially protected against the reduction in food intake elicited by a subsequent injection of 6 mg/kg of fenfluramine. With the exception of methergoline, none of these compounds attenuated the anorexigenic action of 3 or 1.5 mg/kg of fenfluramine. Prior treatment with  $\alpha$ -methyl-p-tyrosine (AMPT) diminished the anorexic activity of 6 mg/kg of amphetamine, but this compound was ineffective against 3 or 1.5 mg/kg. The anorexigenic action of amphetamine, 6 or 3 mg/kg, was reduced by prior administration of haloperidol, whereas 1.5 mg/kg of amphetamine was not

affected. Ss pretreated with chlorimipramine, AMPT, and haloperidol were also tested with p-chloromethamphetamine (PCMA). Results indicate that PCMA cannot be classified as either primarily fenfluramine-like or amphetamine-like in its mode of action. It is concluded that 5-hydroxytryptamine (5-HT) is involved in the anorexigenic effect of high doses of fenfluramine, that catecholamines (principally dopamine) are important in the action of high dose levels of amphetamine, and that the anorexia which follows low doses of fenfluramine and amphetamine occurs via mechanisms not involving 5-HT, norepinephrine, or dopamine. (29 ref)—*Journal abstract.*

2619. Cohen, Michael J. & Rickles, William H. (U California, Medical School, Los Angeles) **Performance on a verbal learning task by subjects of heavy past marijuana usage.** *Psychopharmacologia*, 1974, Vol 37(4), 323-330.—Randomly selected 30 male, heavy users of marihuana and gave them paired-associate learning in a  $2 \times 2$  state-dependent learning design. No significant effects were found between marihuana and placebo groups on trials to criterion, and recall of the task 7 days later was not state-dependent. Results are compared to a previous study using light usage Ss that reported a state-dependent effect. The effects of Ss' past marihuana-usage history and the drug's acute effects on learning and recall are discussed.—*Journal abstract.*

2620. Consolo, Silvana; Ladinsky, Herbert; Peri, Giuseppe & Garattini, Silvio. (Istituto di Ricerche Farmacologiche "Mario Negri," Milan, Italy) **Effect of diazepam on mouse whole brain and brain area acetylcholine and choline levels.** *European Journal of Pharmacology*, 1974(Jul), Vol 27(2), 266-268. A single intravenous dose of diazepam (5 mg/kg) increased whole brain acetylcholine levels. Choline levels, choline acetyltransferase, and acetylcholinesterase activities were not affected. Diazepam increased acetylcholine levels in the hemispheres and diencephalon but not in the cerebellum or mesencephalon. This short-lasting biochemical action precludes a correlation with the long-lasting action of diazepam against pentylenetetrazole.

2621. Cooper, Barrett R.; Cott, Jerry M. & Breese, George R. (U North Carolina, Medical School, Chapel Hill) **Effects of catecholamine-depleting drugs and amphetamine on self-stimulation of brain following various 6-hydroxydopamine treatments.** *Psychopharmacologia*, 1974, Vol 37(3), 235-248.—Examined changes in electrical self-stimulation responding in male Sprague-Dawley rats with electrodes implanted in the lateral hypothalamus following 6-hydroxydopamine (6-OHDA) treatments which depleted brain dopamine (DA), norepinephrine (NE), or both of these catecholamines. Acute depression of self-stimulation occurred after treatments which reduced brain DA. A chronic deficit in self-stimulation responding occurred in Ss treated with 6-OHDA in combination with pargyline to reduce both brain amines, while responding of Ss in which brain DA was reduced returned to levels observed prior to 6-OHDA treatment.  $\alpha$ -Methyltyrosine caused a significant reduction in responding of Ss depleted of brain DA. Administration of U-14624 failed to affect self-stimulation in spite of an additional 70% reduction of brain NE content. The response to dextroamphetamine was significant.

cantly reduced in Ss with brain DA selectively depleted.  $\alpha$ -Methyltyrosine antagonized the increased self-stimulation responding following administration of dextroamphetamine to reserpinized rats while U-14624 did not. Results support the hypothesis that central dopaminergic fibers have an important involvement in the maintenance of self-stimulation of brain. (39 ref) —*Journal abstract.*

2622. Cox, Tom. (U Nottingham, England) The effects of physostigmine during the acquisition of avoidance behaviour as a function of the intersession interval. *Quarterly Journal of Experimental Psychology*, 1974(Aug), Vol 26(3), 387-394.—Trained and tested 217 male Sprague-Dawley rats on an avoidance task in a shuttle box. The change in the performance of the controls over 2 sessions was a U-shaped function of the interval between the sessions. The change in performance of Ss injected intraperitoneally with physostigmine prior to the 2nd session was also a U-shaped function of the intersession interval, although the drug impaired avoidance behavior. Results are consistent with those of M. D. Hamburg (1967) and of G. B. Biederman (1970) and support the contention that cholinergic mechanisms in the brain are involved in the control of avoidance and escape behavior in the rat. They do not necessarily support the hypothesis advanced by J. A. Deutsch (1969, 1971) to describe a biochemical basis of learning and memory. (25 ref)—*Journal abstract.*

2623. Creese, Ian. (Johns Hopkins U, Medical School) Behavioural evidence of dopamine receptor stimulation by piribedil (ET495) and its metabolite S584. *European Journal of Pharmacology*, 1974(Sep), Vol 28(1), 55-58.—Found that piribedil and its catechol metabolite S584 induced enhanced stereotyped behavior and locomotor activity in 12 adult rats treated as neonates with intraventricular 6-hydroxydopamine. These same Ss also showed an enhanced behavioral response to apomorphine (a directly acting dopamine agonist), but a blocked behavioral response to amphetamine (an indirectly acting dopamine agonist). This suggests that the dopaminergic action of piribedil is postsynaptic in origin and may be mediated via its active metabolite S584. (15 ref) —*Journal abstract.*

2624. Czaja, John A.; Goldfoot, David A. & Karavolas, Harry J. (Wisconsin Regional Primate Research Ctr, Madison) Comparative facilitation and inhibition of lordosis in the guinea pig with progesterone,  $5\alpha$ -pregnane-3,20-dione, or 3 $\alpha$ -hydroxy- $5\alpha$ -pregnane-20-one. *Hormones & Behavior*, 1974(Sep), Vol 5(3), 261-274.—Conducted 5 experiments to evaluate the major  $5\alpha$ -reduced metabolites of progesterone, tentatively identified in neural tissue of the guinea pig, for their ability to facilitate and inhibit lordosis responses of adult female spayed guinea pigs after estradiol benzoate (EB) pre-treatment.  $5\alpha$ -dihydroprogesterone was an effective facilitative agent, but at doses of .05-3 mg administered 12-60 hrs after estradiol, it was not as potent as one and  $5\beta$ -pregnane-3,20-dione, evaluated at only 1 dose level (.18 mg) and at 1 time interval after estradiol (36 hr), had moderate facilitative effects, but they were not as effective as  $5\alpha$ -dihydroprogesterone. The inhibitory influences of the metabolites studied were weak

relative to progesterone when given at doses of 0.6 mg 1 hr after EB. However, when  $5\alpha$ -dihydroprogesterone was given at a higher dose (3.6 mg) it was an effective inhibitor of the lordosis response. Results indicate that this metabolite has behavioral influences similar to those of progesterone for both facilitation and inhibition of estrus. (16 ref)—*Journal abstract.*

2625. Dantzer, R. & Baldwin, B. A. (INRA, Station de Pharmacologie, Toulouse, France) Effects of chlordiazepoxide on heart rate and behavioural suppression in pigs subjected to operant conditioning procedures. *Psychopharmacologia*, 1974, Vol 37(2), 169-177.—Subjected a group of 4 Large White male pigs in each of 2 experiments to a punishment discrimination (conflict) or to a nonreinforcement procedure. Conflict behavior was evidenced by the suppression of operant responding and the occurrence of a marked decrease in heart rate during the presentation of the conditioned stimulus. Ss in the nonreinforcement procedure showed no consistent changes in heart rate, although an important decrease occurred in response rate. Chlordiazepoxide was administered to establish whether it would attenuate the response suppression in either procedure. The drug produced a weak attenuation of conflict in terms of the operant and heart-rate responses at the maximum dose used (20 mg/kg) and a small disinhibiting effect on the nonreinforced responding at 10 mg/kg. Such effects were less clear-cut than usually reported in other species. (16 ref)—*Journal abstract.*

2626. Darley, C. F.; Tinklenberg, J. R.; Roth, W. T. & Atkinson, R. C. (VA Hosp, Palo Alto, CA) The nature of storage deficits and state-dependent retrieval under marihuana. *Psychopharmacologia*, 1974, Vol 37(2), 139-149.—Presented 10 20-word lists to 48 adult male paid volunteers before giving them an oral dose of marihuana. Another 10 lists were presented to them following drug administration. Ss studied half of each set of 10 pre- and 10 postdrug lists using an overt fixed-rehearsal procedure and half using their normal covert free-rehearsal procedure. On Day 1 an immediate-recall test followed each of the 20 lists presented. The marihuana-induced deficit in immediate-recall performance on Day 1 for free-rehearsal lists was not eliminated when the fixed-rehearsal procedure was used. Thus, marihuana intoxication impaired the storage of information even when overt rehearsal in the drug and no-drug states was equated. 3 days later, half of the Ss were given marihuana and the rest a placebo. All Ss were then administered delayed recall, recognition, and order tests on the words presented on Day 1. Delayed recall performance was asymmetrically state dependent, whereas delayed recognition performance was not. (18 ref)—*Journal abstract.*

2627. Dixon, Paul W.; Roper, Roy E. & Ahern, Elsie H. (U Hawaii, Hilo Coll) A preliminary study of the use of moxocautery for punishment and medical reasons as a discriminant of personality differences in Japanese nationals. *Psychologia: An International Journal of Psychology in the Orient*, 1974(Mar), Vol 17(1), 28-35.—Discusses the use in Chinese and Japanese medicine of moxocautery, said to have curative qualities resulting from the stimulation of peripheral nerves and blood vessels. Moxocautery has also been used as a form of

punishment for Japanese children. 25 Ss who had previously received moxocautery were tested with a version of the Edwards Personal Preference Scale. Females who had received moxocautery as punishment showed relatively poor socialization. (15 ref)—R. D. Nance.

2628. Driscoll, P. & Bättig, K. (Swiss Federal Inst of Technology, Behavioral Science Inst, Zurich) **Effects of nicotine on the shuttlebox behavior of trained guinea pigs.** *Psychopharmacologia*, 1974, Vol 38(1), 47-54.—Measured the comparative effects of 3 subcutaneous doses of nicotine (.075, .15, and .3 mg/kg) on the shuttlebox behavior of 16 highly trained guinea pigs, using 50-trial sessions and a 15-sec conditioned stimulus-unconditioned stimulus interval. It was found that nicotine counteracted the characteristic intrasession performance decrement seen with this species and, in addition, that the various doses of nicotine could be differentiated from each other and the control (physiological saline) in this test. Results were obtained through the measurement of response latencies and the recording of intertrial responses which, for the purposes and conditions of this and future studies of this type, were more effective parameters than the measurement of avoidance frequency alone. (17 ref)—*Journal abstract*.

2629. Ellinwood, Everett H. & Balster, Robert L. (Duke U, Medical Ctr, Behavioral Neuropharmacology Section) **Rating the behavioral effects of amphetamine.** *European Journal of Pharmacology*, 1974(Sep), Vol 28(1), 35-41.—Derived a 9-point rating scale with a highly standardized protocol for assessing the continuum behavioral effects of amphetamine (e.g., hyperactivity, stereotypy, and dyskinetic-reactive effects) in 2 experiments with a total of 30 female Sprague-Dawley rats. Dose-response curves for intraperitoneal dextro- and levoamphetamine were obtained demonstrating a 4:1 potency ratio of dextro- to levoamphetamine. The capability of the rating scale to assess antagonism of dextro-amphetamine by pimozide suggests that this scale may be a useful quantitative measure of neuroleptic activity of drugs. (22 ref)—*Journal abstract*.

2630. Elonen, Erkki; Mattila, Mauri J. & Saarnivaara, Laila. (U Helsinki, Finland) **Cardiovascular effects of amitriptyline, nortriptyline, protriptyline and doxepin in conscious rabbits.** *European Journal of Pharmacology*, 1974(Sep), Vol 28(1), 178-188.—When tricyclic antidepressants were slowly injected intravenously to conscious rabbits, all 4 drugs studied immediately lowered blood pressure and increased heart rate. Amitriptyline and doxepin proved most potent and provoked severe arrhythmias on electrocardiogram. When the drugs were given during noradrenaline infusion their effects remained similar. Results suggest that in acute experiments the cardiotoxicity of tricyclic antidepressants does not correlate to their inhibitory effects on noradrenaline uptake. (33 ref)

2631. Elsmore, Timothy F. & Manning, Frederick J. (Walter Reed Army Inst of Research, Washington, DC) **Time course and dose-response effects of orally administered delta-9-THC on interval schedule performance of the rat.** *Life Sciences*, 1974(Aug), Vol 15(3), 481-489.—In 2 experiments with 4 male Wistar albino rats in each Ss that had been trained on fixed or variable

interval schedules of food reinforcement were given oral administrations of 4, 8, 16, and 32 mg/kg of  $\Delta^9$ -tetrahydrocannabinol at various times prior to experimental sessions. The 2 lower doses either had no effect or increased response rates up to 8 hrs postadministration. The 2 higher doses suppressed responding, with a maximum effect about 24 hrs postadministration. Responding recovered to baseline levels about 30 hrs after drug administration.—*Journal abstract*.

2632. Engel, J.; Strömbom, U.; Svensson, T. H. & Waldeck, B. (U Göteborg, Sweden) **Suppression by  $\alpha$ -methyltyrosine of ethanol-induced locomotor stimulation: Partial reversal by L-Dopa.** *Psychopharmacologia*, 1974, Vol 37(3), 275-279.—Gave ethanol (2.4 g/kg) or saline intraperitoneally to female NMRI mice separately or 3 hrs after  $\alpha$ -methyltyrosine. Some Ss also received levodopa in various doses 2 hrs before ethanol or saline. All received an inhibitor of peripheral dopa decarboxylase 30 min before levodopa. Immediately after the last injection the locomotor activity was recorded every 5 min for 1 hr. The ethanol-induced stimulation of locomotor activity was suppressed by  $\alpha$ -methyltyrosine and partially reversed by levodopa. The reversal appeared to be optimal at a low dose of levodopa, which by itself did not appear to influence the locomotor activity. Results support the view that central catecholamines are involved in the stimulatory action of ethanol on locomotor activity. (17 ref)—*Journal abstract*.

2633. Ferraro, Douglas P. & Grilly, David M. (U New Mexico) **Effects of chronic exposure to  $\Delta^9$ -tetrahydrocannabinol on delayed matching-to-sample in chimpanzees.** *Psychopharmacologia*, 1974, Vol 37(2), 127-138.—Trained 3 groups of 4 chimpanzees on a 20-sec delayed matching-to-sample task and then exposed them to a 152-day chronic drug regimen. 2 Ss in each group were drug naive. The other 2 had experienced 45 doses of  $\Delta^9$ -tetrahydrocannabinol (THC) 4 mo prior to the present experiment. One group of Ss served as nondrug controls. A 2nd control group received an oral dose of 1.0 mg/kg THC following each matching-to-sample session. The experimental group was given the same dose of THC prior to each daily session. The initial administrations of the drug before but not after each session produced a significant decrease in matching-to-sample accuracy. During the course of the chronic drug regimen, experimental Ss recovered very slowly from this initial impairment in matching-to-sample performance. The extent to which the experimental Ss recovered seemed to depend upon their preexperimental drug histories. The drug-experienced Ss developed complete tolerance within 5 wks while the previously drug-naive Ss did not so do even after 5 mo exposure to the drug. (22 ref)—*Journal abstract*.

2634. File, Sandra E. & Pope, J. H. (City of London Polytechnic, England) **The action of chlorpromazine on exploration in pairs of rats.** *Psychopharmacologia*, 1974, Vol 37(3), 249-254.—Conducted an experiment with 100 male hooded rats. When 2 Ss were placed in a hole-board, the number of headdips made by each S was twice the number made when tested alone, but was the same for pairs of drugged (2 mg/kg chlorpromazine) and undrugged Ss and for pairs where only 1 S was drugged. This contrasted with the reduction of headdipping

produced by chlorpromazine in single Ss. However, chlorpromazine still reduced general motor activity, regardless of whether the partner was drugged or not. The activity of the undrugged Ss was affected by the partner's state and was lower when the partner was drugged.—*Journal abstract.*

2635. Frankel, D.; Khanna, J. M.; Kalant, H. & LeBlanc, A. E. (U Toronto, Ontario, Canada) **Effect of acute and chronic ethanol administration on serotonin turnover in rat brain.** *Psychopharmacologia*, 1974, Vol 37(2), 91-100.—In male Wistar rats treated acutely and chronically with ethanol, brain serotonin (5-HT) turnover was determined by measuring in the same Ss the rate of accumulation of 5-HT and the rate of decline of 5-hydroxyindoleacetic acid in the brain after administration of the monoamine oxidase inhibitor pargyline-HCl. In the acute study, 5-HT turnover was not altered after a single 4 g/kg oral dose of ethanol. In 2 separate studies, it was shown that chronic administration of ethanol in the form of a liquid diet for 32 days also did not alter brain 5-HT turnover, even when the Ss had developed a significant degree of tolerance to the motor-impairing effects of ethanol. Results suggest that tolerance to ethanol is unrelated to any change in brain 5-HT turnover. (33 ref)—*Journal abstract.*

2636. Frankenheim, Jerry M. (U Western Australia, Nedlands) **Effects of repeated doses of  $\Delta^1$ -trans-tetrahydrocannabinol on schedule-controlled temporally-spaced responding of rats.** *Psychopharmacologia*, 1974, Vol 38(2), 125-144.—Observed the effects of chronic daily intraperitoneal injections of a marihuana (cannabis) constituent,  $\Delta^1$ -tetrahydrocannabinol ( $\Delta^1$ -THC), on the temporally spaced leverpressing of 4 male Wistar rats maintained under a differential reinforcement of low rates of responding schedule of water reinforcement. A different chronic dose was given to each S. During the test session following the 1st drug injection, the 2 Ss which received the lower doses (5.62 or 10.0 mg/kg) showed lengthy periods of no leverpressing, and the 2 Ss receiving the higher doses (17.8 or 31.6 mg/kg) showed almost no leverpressing. In the case of the lower doses, the response rate between the long pauses was increased. With repeated injections, tolerance developed to the drug-induced cessation of responding at all dose levels, but increased sensitivity to the response rate-increasing effect was observed, particularly with the 10.0 and 17.8 mg/kg doses. These behavioral effects were probably not mediated by drug-induced changes in body temperature regulation. The increased sensitivity to the rate-increasing effect of  $\Delta^1$ -THC with repeated injection may be related to the "reverse tolerance" to marihuana's psychological effects that has been reported in man. (3 p ref)—*Journal abstract.*

2637. Frumkin, Kenneth. (Edgewood Arsenal, Biomedical Lab, Aberdeen, MD) **Physical dependence in rats after low morphine doses.** *Life Sciences*, 1974(Aug), Vol 15(3), 455-462.—Investigated the minimum level of morphine administration necessary to produce physical dependence in rats. 24 male Sprague-Dawley rats received low doses of morphine (10 mg/kg) intraperitoneally once daily for 1, 3, or 5 days. 24 Ss served as saline controls. Naloxone given intraperitoneally 1 hr after the last morphine injection produced

significant withdrawal signs after only 3 days. (20 ref)—*Journal abstract.*

2638. Gilbert, R. M. (Addiction Research Foundation, Toronto, Ontario, Canada) **Schedule-induced ethanol polydipsia in rats with restricted fluid availability.** *Psychopharmacologia*, 1974, Vol 38(2), 151-157.—Spaced feeding of individual food pellets to 6 food-deprived male hooded rats at 1-min intervals caused excessive drinking of 5 and 10% alcohol solutions, even though the solutions were available for only a 10-sec portion of each interval and even though the portion of availability occurred anywhere in the interval unpredictably from one interval to another. It is concluded that schedule-induced ethanol polydipsia is not necessarily a postreinforcement phenomenon.—*Journal abstract.*

2639. Goldstein, Dora B. & Kakihana, Ryoko. (Stanford U, Medical School) **Alcohol withdrawal reactions and reserpine effects in inbred strains of mice.** *Life Sciences*, 1974(Aug), Vol 15(3), 415-425.—Male C57BL/6J, DBA/2J, BALB/cJ, and Swiss-Webster mice were treated with ethanol for 3 days by inhalation of alcohol vapor and daily intraperitoneal injections of pyrazole. The alcohol-adapted Ss received 3.8% alcohol in their drinking water for 1 wk and 7.5% for the next 16 or 19 wks. During the inhalation period, C57BL Ss had lower blood alcohol levels than DBA, and alcohol-adapted Ss had slightly lower blood levels than controls. On withdrawal, Ss were examined repeatedly for convulsions elicited by handling. The withdrawal scores of C57BL Ss were significantly lower than those of DBA, BALB, or Swiss-Webster Ss, more so than could be accounted for by the difference in blood alcohol levels. Ss of 3 strains were treated with reserpine and observed for behavioral effects, including convulsions on handling. Strain differences in reserpine effects closely paralleled the strain differences in alcohol withdrawal seizures. (19 ref)—*Journal abstract.*

2640. Goudie, A. J.; Taylor, M. & Wheeler, T. J. (University Coll North Wales, Bangor) **Chronic anorexic and behavioural effects of the fenfluramine metabolite, norfenfluramine: An evaluation of its role in the actions of fenfluramine.** *Psychopharmacologia*, 1974, Vol 38(1), 67-74.—Conducted 2 experiments involving administration of norfenfluramine by intraperitoneal and subcutaneous routes, respectively, to 8 male hooded rats. 8 other Ss served as saline controls. Behavioral effects were assessed by time sampling categorization on Days 1 and 14 of a 20-day chronic study and anorexic effects by daily weighing. Norfenfluramine was found to be a potent anorexiant to which tolerance was established fairly quickly. It also possessed sedative properties after acute administration but marked stimulant properties after 14 days chronic administration. These results are similar to those previously reported in a study of fenfluramine, although the behavioral effects of norfenfluramine were more marked. Results implicate norfenfluramine in the anorexic and behavioral effects of fenfluramine and provide indirect confirmation of the suggestion made in an earlier paper that fenfluramine may have chronic stimulant properties. (29 ref)—*Journal abstract.*

2641. Gray, Gary D.; Davis, Harry N. & Dewsbury, Donald A. (U Florida) **Effects of L-dopa on the**

heterosexual copulatory behavior of male rats. *European Journal of Pharmacology*, 1974(Aug), Vol 27(3), 367-370.—Administered 175 mg/kg levodopa plus 50 mg/kg Ro 4-4602 intraperitoneally to 20 male Long-Evans rats in Exp I. The drug combination prolonged the time required for copulation. Levodopa alone produced similar though smaller, nonsignificant effects. Dose dependent increases in time required for copulation were obtained in Exp II in 24 males given 100, 150, and 200 mg/kg levodopa plus Ro 4-4602. It is suggested that levodopa acts to inhibit heterosexual copulatory behavior in sexually vigorous males.—*Journal abstract*.

2642. Griffiths, Peter J.; Littleton, John M. & Ortiz, Aurelio. (King's Coll, U London, England) **Changes in monoamine concentrations in mouse brain associated with ethanol dependence and withdrawal.** *British Journal of Pharmacology*, 1974(Apr), Vol 50(4), 489-498.—Reports that chronic administration of ethanol to mice by inhalation induced tolerance to ethanol and produced an increase in the concentration of brain monoamines. Withdrawal of ethanol from dependent mice caused behavioral changes associated with a further transient rise in brain monoamine concentrations which then declined to control levels. Inhibition of the withdrawal syndrome by the administration of ethanol postponed the changes in monoamines associated with withdrawal. Administration of inhibitors of catecholamine synthesis before withdrawal of ethanol modified the withdrawal syndrome.—*Journal abstract*.

2643. Hollister, Leo E. (VA Hosp, Palo Alto, CA) **Clinical pharmacology of marihuana.** In R. J. Gibbons et al (Eds), *Research advances in alcohol and drug problems: I*. New York, NY: John Wiley & Sons, 1974. xvii, 428 p.—Presents a review of marihuana research with human Ss. Topics discussed include methodological problems (e.g., dosages); constituents, metabolites, and homologs; pharmacokinetics; clinical syndromes; physiological, biochemical, and psychological effects; therapeutic uses; adverse effects; and comparisons of marihuana with other drugs. (73 ref)

2644. Jacob, Joseph J.; Tremblay, Evelyne C. & Colombel, Marie-Claude. (Inst Pasteur, Service de Pharmacologie, Paris, France) **[Enhancement of nociceptive reactions by naloxone in mice and rats.]** (Fren) *Psychopharmacologia*, 1974, Vol 37(3), 217-223.—Studied the effects of graded doses of naloxone in Swiss G, Swiss E, and Cobs River mice and in Sprague-Dawley and Sherman rats. Enhancements of nociceptive reactions were observed provided the control reaction times were long enough, a condition which was fulfilled for the jumping reaction at different temperatures of the hot plate (50-80°C in mice and 55°C in rats), but for the licking reaction only at the lowest temperature (50°C in mice). Nalorphine had no such overt action. As low subcutaneous doses of naloxone (.1-1 mg/kg) were effective, the enhancement is accounted for by interactions at the level of the specific opioid receptors, some of which are suggested. The phenomenon might be relevant to the interpretation of the mechanisms of precipitated abstinence. (15 ref)—*Journal abstract*.

2645. Jacobs, B. L.; Eubanks, E. E. & Wise, W. D. (Princeton U) **Effect of indolealkylamine manipulations on locomotor activity in rats.** *Neuropharmacology*,

1974(Jul), Vol 13(7), 575-583.—Conducted a series of 6 experiments with a total of 81 experimental and 45 control male Sprague-Dawley rats. 6-fluorotryptophan produced a small, but significant decrease in activity. Neither variations in the dietary content of levotryptophan nor systemic injections of levotryptophan had any effect on activity. However, pretreatment with the monoamine oxidase inhibitor, pargyline, caused levotryptophan injections to produce a syndrome characterized by large increases in activity, tremor, rigidity, hyperreactivity, stereotyped head movements, and a general sympathetic response. Pretreatment with spiroperidol, a presumed specific dopamine-receptor blocker, abolished all signs of the syndrome except for the rigidity and hyperreactivity. By contrast, the noradrenergic receptor blockers, phenoxybenzamine and propanolol, had no observable effect on the syndrome. (22 ref)—*Journal abstract*.

2646. Janiec, W.; Korczak-Dziuba, K. & Herman, Z. S. (Silesian School of Medicine, Katowice, Poland) **Effect of phenothiazine neuroleptic drugs and tricyclic antidepressants on phosphodiesterase activity in rat cerebral cortex.** *Psychopharmacologia*, 1974, Vol 37(4), 351-358.—Investigated the activity of phosphodiesterase (PDE) in male Wistar rat cerebral cortex following the administration in vitro and in vivo of various concentrations of neuroleptic phenothiazine drugs and tricyclic antidepressive drugs. PDE activity was inhibited by phenothiazine neuroleptic drugs (fluphenazine > trifluoperazine > thiopropazine > chlorpromazine = thioridazine). Tricyclic antidepressants nortriptyline, chlorimipramine, protriptyline, imipramine, and desipramine caused 60-80% inhibition of PDE activity. The phenothiazine compounds inhibited the high-affinity PDE activity more than the PDE activity of low affinity to the substrate. Results suggest that the mechanism of the neuroleptic action of phenothiazine drugs is partially connected with their influence on cyclic 3',5'-adenosine monophosphate metabolism. (28 ref)—*Journal abstract*.

2647. Jarvik, Lissy F. et al. (U California, Ctr for Health Sciences, Los Angeles) **Chromosome examinations after medically administered lysergic acid diethylamide and dextroamphetamine.** *Diseases of the Nervous System*, 1974(Sep), Vol 35(9), 399-407.—Data from 8 24-45 yr old Ss demonstrate that the addition of LSD *in vitro* leads to chromosome damage in excess of that observed in cultures without added LSD even though all the *in vitro* studies were conducted on blood cultures derived from patients who had already received the drug *in vivo*. No evidence for measurable detrimental effects of LSD and dextroamphetamine was observed when the 2 drugs were administered under medical supervision.

2648. Jhamandas, K. & Surak, M. (Queen's U, Kingston, Ontario, Canada) **Modification of brain acetylcholine release by morphine and its antagonists in normal and morphine-dependent rats.** *British Journal of Pharmacology*, 1974(Jan), Vol 50(1), 57-62.—Investigated changes in the spontaneous release of cortical acetylcholine (ACh) following injection of morphine and its antagonists in the normal and morphine-dependent rats. Administration of naloxone or nalorphine in dependent, but not in normal, rats produced an increase

in the release of cortical ACh. Injection of morphine in normal rats produced a decrease in ACh release but similar injections in the morphine-dependent rats did not produce this effect. The relationship between the observed effects and the dependence on narcotic analgesics is discussed.—*Journal abstract.*

2649. Jori, Armanda et al. (Istituto di Ricerche Farmacologiche "Mario Negri," Milan, Italy) **Effect of piribedil and one of its metabolites on the concentration of homovanillic acid in the rat brain.** *European Journal of Pharmacology*, 1974(Jul), Vol 27(2), 245-248.—Administered piribedil and its metabolite (pyrimidyl-2')-1-(dihydroxy-3', 4' -benzyl) -4-piperazine dichlorhydrate (PdHBP) to female Charles River rats in intraperitoneal doses of 7.5-240 mg/kg. Both drugs, like apomorphine, decreased the level of homovanillic acid (HVA) in the rat striatum. The effect appeared rapidly and lasted for about 2 hrs. Piribedil antagonized the rise of striatal HVA elicited by chlorpromazine, haloperidol, and fenfluramine. Piribedil, PdHBP, and apomorphine did not counteract the increase of striatal HVA induced by dextroamphetamine. (25 ref)—*Journal abstract.*

2650. Julien, R. M. & Kavan, Eva M. (U California, Medical School, Irvine) **Electrographic studies of isoflurane (Forane).** *Neuropharmacology*, 1974(Jul), Vol 13(7), 677-681.—In 7 chronically implanted cats, anesthetic concentrations of isoflurane induced spontaneous high-voltage spike activity. Significant residual behavioral or electrographic disturbances were not observed over a 14-day period. In 10 acutely implanted Ss, evoked responses recorded in primary somatosensory pathways were little affected by anesthetic concentrations of isoflurane, while those recorded in structures of the diffuse projection system were markedly large-sized.

2651. Karniol, Isac G. et al. (Escola Paulista de Medicina, São Paulo, Brazil) **Cannabinol interferes with the effects of  $\Delta^9$ -tetrahydrocannabinol in man.** *European Journal of Pharmacology*, 1974(Sep), Vol 28(1), 172-177.—Investigated the possible interaction between cannabidiol (CBD) and  $\Delta^9$ -tetrahydrocannabinol ( $\Delta^9$ -THC) in human beings. In a double-blind procedure, 40 male medical doctor and student volunteers were assigned to 1 of 8 experimental groups that received per oral route placebo; 30 mg  $\Delta^9$ -THC; 15, 30, or 60 mg CBD; and mixtures of 30 mg  $\Delta^9$ -THC plus either 15, 30, or 60 mg CBD, respectively. Pulse rate, time production tasks, and psychological reactions were measured at several time intervals after drug ingestion. 30 mg  $\Delta^9$ -THC alone increased pulse rate, disturbed time tasks, and induced strong psychological reactions in the Ss. 15-60 mg CBD alone provoked no effects. CBD was efficient in blocking most of the effects of  $\Delta^9$ -THC when both drugs were given together. CBD also decreased the anxiety component of  $\Delta^9$ -THC effects in such a way that the Ss reported more pleasurable effects. (21 ref)—*Journal abstract.*

2652. Kessler, Christopher C. **The effect of magnesium pemoline on learning in the planarian.** *Journal of Biological Psychology*, 1973(Dec), Vol 15(2), 31-33.—Conditioned 2 groups of planarians (*Dugesia dorotocephala*) to contract to light. 1 group was housed in spring water and the other in spring water containing magnesium pemoline (MP). The MP group learned conditional responses at a significantly higher rate than

had the control group. No significant difference was found between groups in any other response measures.

2653. Landauer, Ali A.; Pocock, Derek A. & Prott, F. W. (U Western Australia, Nedlands) **The effect of medazepam and alcohol on cognitive and motor skills used in car driving.** *Psychopharmacologia*, 1974, Vol 37(2), 159-168.—Gave questionnaires, motor-skill, and cognitive tests to 3 groups of 12 healthy male undergraduate paid volunteers after administration of either 0, 10, or 20 mg of medazepam (Nobrium). Tests were given both before and after experimental intoxication with 1 ml/kg bodyweight of diluted ethanol. On most tests medazepam did not interact with alcohol: no synergistic or antagonistic drug reaction was observed. A greater subjective fatigue rating by the drug groups was not confirmed by objective measures. The use of psychoactive drugs with ambulant patients is discussed, and it is concluded that medazepam medication has no detrimental effect on driving ability.—*Journal abstract.*

2654. Lassen, J. Buus. **Evidence for a noradrenergic and dopaminergic mechanism in the hyperactivity produced by 4,  $\alpha$ -dimethyl-m-tyramine (H 77/77) in rats.** *Psychopharmacologia*, 1974, Vol 37(4), 331-340.—Subcutaneous doses of H-77/77 (2.5 and 5 mg/kg) produced locomotion, sniffing, rearing, head twitch, and various grooming movements in rats. The H-77/77-hyperactivity was antagonized by the tyrosine hydroxylase inhibitor H-44/68 (250 mg/kg), the dopamine- $\beta$ -hydroxylase inhibitor FLA 63 (40), the noradrenaline (NA) receptorblockers aceperone (1.1) and phenoxybenzamine (0.8), the thymoleptics imipramine (.7), desipramine (6.3), chlorimipramine (1.5), amitriptyline (.1), nortriptyline (1.0), protriptyline (.7), and doxepine (.3) as well as the neuroleptics chlorpromazine (.015), thioridazine (.7), perphenazine (.008), chlorpromazine (.03), haloperidol (.02), spiramide (.03), pimozide (.04), and clozapine (.014). Results indicate that release of catecholamines, especially NA, is involved in the mediation of H-77/77-induced hypermotility and that NA-membrane-blocking thymoleptics inhibit uptake of H-77/77 into brain NA neurons. Activation of both dopamine and NA receptors are necessary for the production of the H-77/77 behavioral syndrome, as selective blockade of either system can prevent it. (37 ref)—*Journal abstract.*

2655. LeBlanc, A. E. & Cappell, Howard. (Addiction Research Foundation, Toronto, Ontario, Canada) **Attenuation of punishing effects of morphine and amphetamine by chronic prior treatment.** *Journal of Comparative & Physiological Psychology*, 1974(Oct), Vol 87(4), 691-698.—In a previous study L. Parker et al (see PA, Vol 50:548) found that the gustatory aversion normally produced by morphine did not occur when rats were first made dependent on the drug. Their explanation of this phenomenon was that dependent, withdrawn animals are in an "unnatural need state" such that a taste stimulus paired with morphine will become preferred by pairing with a beneficial need-replenishing event. This explanation was examined in the present 2 experiments with a total of 180 male Wistar rats. In Exp I the Parker et al results were supported in a conceptually similar experiment. In Exp II it was shown that analogous results could be produced with amphetamine, a drug upon which physical dependence has not been unequivocally

demonstrated and for which the regulation of self-administration does not follow the morphine pattern. Since the evidence for a "need" artificially induced by amphetamine withdrawal was not strong, the hypothesis that these data reflect preference for a substance associated with need reduction may be questioned. Of the various explanations for the phenomenon, only one involving the concept of drug tolerance has no arguments against it. (16 ref)—*Journal abstract*.

2656. Livingston, Andrew. (VA Hosp, Pavlovian Research Lab, Perry Point, MD) **Effect of dopamine on diuresis and its role in forming a renal CR.** *Pavlovian Journal of Biological Science*, 1974(Jul-Sep), Vol 9(3), 160-168.—Studied the effect of dopamine on diuresis and formation of a renal conditioned response in 4 female mongrel dogs. In 3 dogs with externalized ureters, dopamine produced changes in renal secretion and cardiac rates. When the conditional stimulus (normal saline and tone) was given after several months of training with the conditional signal and the dopamine injection, there was no significant CR change in the heart rate or any urine components. It is concluded that in spite of the great increase of urine volume and composition of the above substances, there was no significant signal increase resulting from the intramuscular injection of dopamine.—*Journal summary*.

2657. Marcus, Anthony M.; Klonoff, Harry & Low, Morton. (U British Columbia, Div of Forensic Psychiatry, Vancouver, Canada) **Psychiatric status of the marihuana user.** *Canadian Psychiatric Association Journal*, 1974(Feb), Vol 19(1), 31-39.—Reports findings from medical and psychological evaluations of 43 female and 38 male 19-31 yr old marihuana smokers. In view of previous findings on marihuana obtained in laboratory studies, Ss reported remarkably few adverse effects. It is stressed that self-reports of the effects of drugs cannot be taken at face-value. A method of classification of adverse and nonadverse drug effects is suggested. (19 ref)—*F. Auld*.

2658. Marcus, Richard & Kornetsky, Conan. (Boston U, Medical School, Behavioral Pharmacology Lab) **Negative and positive intracranial reinforcement thresholds: Effects of morphine.** *Psychopharmacologia*, 1974, Vol 38(1), 1-13.—Implanted 7 male CDF strain Charles River albino rats with electrodes aimed for aversive structures and 14 Ss with electrodes aimed for positive structures. Negative (aversive) and positive (self-stimulation) intracranial reinforcement thresholds were determined using a "double staircase" psychophysical procedure. Morphine raised aversive thresholds at all doses tested, while the drug lowered positive reinforcement thresholds at low or moderate doses. Results suggest the possible involvement of central motivational systems in the mediation of morphine-induced analgesia, in the narcotic "high," and in narcotic addiction. (33 ref)—*Journal abstract*.

2659. Maugh, Thomas H. **Marihuana (II): Does it damage the brain?** *Science*, 1974(Aug), Vol 185(4153), 775-776.—Examines the literature concerning the controversial possibility that marihuana may be a health hazard. 2 objective conclusions may be reached from data accumulated over 5 yrs of research: (a) there is probably little or no damage associated with a single or a

few uses of marihuana and (b) there is evidence that suggests danger from long-term, heavy use of the drug. Concerning the latter, empirical data show that the psychoactive constituent of cannabis, tetrahydrocannabinol (THC), has a high affinity for brain and lipophilic tissue and will be absorbed and stored by them for long periods. It is contended that continued presence of THC in the brain produces the "amotivational syndrome": apathy and sluggishness in mental and physical responses, flattening of affect, loss of interest in personal appearance, physical exhaustion, loss of time sense, difficulty with recent memory, and mental confusion. These symptoms have persisted in some individuals for as long as 24 mo after withdrawal of the drug, and investigators have suggested that these individuals may have suffered irreversible brain damage. Observation of larger samples of heavy marihuana users is urged since the adverse effects are manifested in only a fraction of susceptible users.—*B. McLean*.

2660. Mayer, H. (Heidelberg U, Ludolf-Krehl Clinic, W Germany) **[Correlation of blood pressure and aggressivity.]** (Germ) *Zeitschrift für Klinische Psychologie und Psychotherapie*, 1972, Vol 20(4), 363-371.—Studied the correlation between Factor 2 (aggressivity) of the Freiburg Personality Inventory (FPI-2) and blood pressure under the influence of various standardized stressors, in particular the Lee Delayed Auditory Feedback (DAF). 48 student Ss were chosen on the basis of their extreme anxiety and aggressivity scores and divided into 4 groups of 12 each: aggressive-anxious, aggressive-nonanxious, nonaggressive-anxious, and nonaggressive-nonanxious. Each S was tested without drugs, with 10 mg of diazepam (Valium), and with placebo. Es recorded the groups' mean values of blood pressure amplitudes with and without DAF. In a 2nd test series, only the stay in the laboratory was used as stressor, and the values of the adaptation time periods were taken as criteria and correlated to aggressivity. Results of the tests are analyzed in detail. They indicate (a) a significant correlation between blood pressure values under DAF and laboratory stress on one hand and aggressivity scores on the other; (b) a correlation between extreme aggression scores and diastolic high RR-reaction scores, and (c) the elimination of high RR-reaction scores by diazepam therapy. (English summary)—*T. Fisher*.

2661. Morrison, Cathleen F. (Tobacco Research Council Lab, Harrogate, England) **Effects of nicotine on the observed behaviour of rats during signalled and unsignalled avoidance experiments.** *Psychopharmacologia*, 1974, Vol 38(1), 37-46.—Conducted 3 experiments with a total of 25 pairs of Sprague-Dawley and F1 hybrid rats. Ss which had been chronically injected subcutaneously with nicotine or with saline during avoidance training were observed during subsequent avoidance experiments. Among those trained and tested on an unsignalled schedule, lever-holding and crouching were frequent, and the stimulant effects of nicotine, though consistent, were small. When a warning signal preceded each shock or a feedback signal followed each response lever-holding and crouching were reduced. In these experiments the Ss tested with saline were inactive, but they tended to lie down rather than crouch during their

periods of immobility. Nicotine-treated Ss in the signaled experiments were active with high levels of sniffing and grooming behavior. It is suggested that the lever-holding and crouching in the unsignaled experiment were both aspects of freezing behavior.—*Journal abstract.*

2662. Morrison, Cathleen F. (Tobacco Research Council Lab, Harrogate, England) **Effects of nicotine and its withdrawal on the performance of rats on signalled and unsignalled avoidance schedules.** *Psychopharmacologia*, 1974, Vol 38(1), 25-35.—Conducted 3 experiments with a total of 42 pairs of Sprague-Dawley and F1 hybrid rats. Ss were trained while under the influence of subcutaneously administered nicotine on a Sidman avoidance schedule. When saline was substituted for nicotine the Ss which had been trained on an unsignaled schedule showed poor avoidance and took significantly more shocks than their saline-trained partners. When the schedule included either a warning signal preceding each shock or a feedback signal following each response this dependence did not develop. It is suggested that dependence on nicotine is related to the stressfulness of the situation and that the behavioral disruption found in its absence is due to an accentuation of the normal warmup process and not to dissociation of learning. (17 ref)—*Journal abstract.*

2663. Noble, Ralph. (Wisconsin Regional Primate Research Ctr, Madison) **Estrogen plus androgen induced mounting in adult female hamsters.** *Hormones & Behavior*, 1974(Sep), Vol 5(3), 227-234.—Administered either estradiol benzoate (EB), dihydrotestosterone propionate (DHTP), testosterone propionate (TP), androstenedione (AD), EB + DHTP, or estrone (E<sub>1</sub>) + DHTP to 49 ovariectomized hamsters daily. All androgens were administered in doses of 1 mg/day for the 1st 24 days and 2 mg/day for the last 14 days. The EB dose was 6 µg/day and the E<sub>1</sub> dose was 100 µg/day. Ss were tested to the behavior 1 time/wk starting on Day 10 and for female behavior on Day 39. 100% of the EB + DHTP Ss, 67% of the E<sub>1</sub> + DHTP Ss, 55% of the AD Ss, 33% of the TP Ss, 29% of the DHTP Ss, and none of the EB Ss mounted during at least 1 test. Only 1 of the E<sub>1</sub> + DHTP Ss showed the intromission pattern displayed by most of the Ss that mounted. A median in the of 21-31 days preceded the onset of mounting and did not differ among treatment groups. (20 ref)—*Journal abstract.*

2664. Nurimoto, Seiichi; Suzuki, Shogo; Hayashi, Goro & Takeda, Mikio. (Tanabe Seiyaku Co, Safety Research Lab, Osaka, Japan) **Homobenzomorphan compounds with a potent narcotic antagonist property.** *Japanese Journal of Pharmacology*, 1974(Jun), Vol 24(3), 461-469.—Tested the antagonistic activity of morphine-induced analgesia and respiratory depression of the 2'-hydroxy-6,10-dimethyl-7,8-homobenzomorphans in mice and rabbits. It was found that the order of antagonistic activity was *N*-cyclopropylmethyl (trans isomer TA-414 and cis isomer TA-576) > *N*-allyl (trans isomer TA-412) > *N*-dimethylallyl (trans isomer TA-413 and cis isomer TA-415) with respect to the influence of replacing antagonistic substitution on the tertiary nitrogen. The properties of TA-414 and TA-576 in this regard were higher than those of nalorphine but slightly less than levallorphan. The narcotic antagonist action of TA-414

was of long duration, comparable to that of nalorphine. TA-414 was entirely lacking an agonistic (analgesic) activity even at large doses, while TA-576 equaled nalorphine and pentazocine in the potency of agonistic activity in mice. Conclusively, TA-414 appears to belong in the category of a pure antagonist such as naloxone. (44 ref)—*Journal abstract.*

2665. Ostrenga, James A. **Methylphenidate—ritalin.** *PharmChem Newsletter*, 1973, Vol 2(7), 1, 4.—Describes the pharmacology of methylphenidate (Ritalin), including drug interaction effects, adverse reactions, potential for misuse, and its primary use as medication for hyperkinesia. A table of 164 substances with descriptions of alleged and actual contents, origins, date of 1st reported appearance, and street prices is included for September 1973.

2666. Oswald, Ian. (U Edinburgh, Scotland) **Pharmacology of sleep.** In O. Petre-Quadens & J. D. Schlag (Eds), *Basic sleep mechanisms*. New York, NY: Academic Press, 1974. xix, 459 p. \$23.50.—Discusses research on the effects of drugs—including the monoamine oxidase inhibitors, the benzodiazepine hypnotics, and the tricyclic antidepressants—on human sleep. The rebound of paradoxical sleep above normal after repeated consumption and then withdrawal of some drugs, the behavioral correlates of this rebound, and the need for chronic pharmacological studies of sleep are cited.

2667. Palmer, G. C. & Manian, A. A. (U New Mexico, Medical School) **Inhibition of the catalytic site of adenylate cyclase in the central nervous system by phenothiazine derivatives.** *Neuropharmacology*, 1974(Jul), Vol 13(7), 651-664.—In rat and rabbit neuronal and glial-enriched cerebral cortex fractions, the dihydroxylated analogs of chlorpromazine, prochlorperazine, perphenazine, and promazine along with the dioxo form of chlorpromazine were the most potent inhibitors of either basal activity or fluoride activation of the enzyme. 7,8-dihydroxychlorpromazine and 7,8-dioxochlorpromazine exerted profound antagonism of norepinephrine-sensitive adenylate cyclase in neuronal and glial-enriched fractions. Data suggest that the actions of specific metabolites of phenothiazines may account for additional intracellular effects following experimental or therapeutic administration of any parent compound. (45 ref)

2668. Parker, Robert B. (Parke, Davis & Co, Research & Development Div, Ann Arbor, MI) **Mouse locomotor activity: Effect of morphine, narcotic antagonists, and the interaction of morphine and narcotic antagonists.** *Psychopharmacologia*, 1974, Vol 38(1), 15-23.—Investigated the effects on Swiss-Webster mice of subcutaneous cyclazocine, levallorphan, diprenorphine, nalorphine, naloxone, and naltrexone in regard to their activity as antagonists of morphine-induced locomotor activity and their ability to stimulate locomotor activity themselves. All 6 compounds antagonized the effect of morphine, but only cyclazocine and levallorphan produced any significant stimulation of locomotor activity by themselves at the doses tested. Results indicate that changes in mouse locomotor activity can be used successfully to monitor the interaction between morphine and narcotic antagonists and that locomotor activity studies can also be used

to study the stimulant (agonist) properties of narcotic antagonists. (16 ref)—*Journal abstract.*

2669. Payne, A. P. (U Glasgow, Scotland) **A comparison of the effects of androstenedione, dihydrotestosterone and testosterone propionate on aggression in the castrated male golden hamster.** *Physiology & Behavior*, 1974(Jul), Vol 13(1), 21-26.—In 2 experiments a total of 55 (including 7 unoperated controls) adult male hamsters were isolated for 6 wks, and their aggressive responses to intact intruders placed into the home-cage observed while they received subcutaneous oil administration (control), testosterone propionate, dihydrotestosterone, or androstenedione. All 3 androgens elicited significantly higher levels of aggression in the castrated males than oil alone. Of the 3, androstenedione was the most effective and dihydrotestosterone the least, although on somatic considerations androstenedione was the least potent androgen. (48 ref)—*Journal abstract.*

2670. Pohorecky, Larissa A.; Jaffe, Lee S. & Berkeley, Hope A. (Rockefeller U, New York, NY) **Ethanol withdrawal in the rat: Involvement of noradrenergic neurons.** *Life Sciences*, 1974(Aug), Vol 15(3), 427-437.—Induced ethanol dependence in male Sprague-Dawley rats by maintaining them for 3 wks on a liquid diet containing ethanol. When ethanol was abruptly replaced with sucrose in the diet, Ss showed withdrawal symptoms. 8 hours later, the accumulation in brain and heart of <sup>3</sup>H-norepinephrine and of <sup>3</sup>H-norepinephrine metabolites was greater than in Ss not undergoing withdrawal. If the rate of ethanol withdrawal was slow (i.e., the ethanol in the diet was replaced gradually with sucrose over a 3-day period) less accumulation of <sup>3</sup>H-norepinephrine and <sup>3</sup>H-norepinephrine metabolites occurred in heart and in brain than as a result of abrupt withdrawal. Results indicate that (a) gross withdrawal symptoms and the accompanying activation of noradrenergic neurons can be blocked during withdrawal by an acute dose of ethanol and (b) ethanol withdrawal can be modified by altering the rate of withdrawal. It is concluded that the withdrawal symptoms and the activation of noradrenergic neurons during withdrawal are caused by the sudden lack of ethanol in the system. (19 ref)—*Journal abstract.*

2671. Poitou, P. & Guerinot, F. (Lab de Biologie Clinique et Expérimentale Inst Gustave-Roussy, Villejuif, France) **Effect of lithium on central metabolism of 5-hydroxytryptamine.** *Psychopharmacologia*, 1974, Vol 38(1), 75-80.—The intraperitoneal administration of lithium carbonate for 5 days to Sprague-Dawley rats increased the synthesis rate of brain serotonin without modifying the brain level of the amine. This increase was not due to a modification of the free tryptophan in the blood. The level of serotonin and 5-hydroxyindoleacetic acid remained unchanged in 7 areas of brain. Results are discussed in comparison with the results of the other authors on the same subject. (22 ref)—*Journal abstract.*

2672. Raiteri, Maurizio; Levi, Giulio & Federico, Rodolfo. (U Cattolica, Istituto di Farmacologia, Rome, Italy) **d-Amphetamine and the release of <sup>3</sup>H-norepinephrine from synaptosomes.** *European Journal of Pharmacology*, 1974(Sep), Vol 28(1), 237-240.—Studied the release of <sup>3</sup>H-norepinephrine from male Wistar rat brain synaptosomes by a superfusion technique which

prevents re-uptake of the released amine. Dextroamphetamine had a minimal stimulatory effect on <sup>3</sup>H-norepinephrine release and was a potent uptake inhibitor. It is suggested that dextroamphetamine may act primarily by inhibiting norepinephrine re-uptake at adrenergic synapses.

2673. Ratcliffe, Bruce E. M.D. *PharmChem Newsletter*, 1973, Vol 2(5), 1, 4.—Describes the history, pharmacology, psychological and physiological effects, and adverse reactions of 3,4-methylenedioxymphetamine (MDA). A table of 141 substances with descriptions of actual and alleged contents, origins, date of 1st reported appearance, and current street prices is included for June 1973.

2674. Rosen, A. J. & Freedman, P. E. (U Illinois) **The effects of p-chloroamphetamine on instrumental conditioning in the rat.** *Neuropharmacology*, 1974(Jul), Vol 13(7), 585-590.—40 male Holtzman albino rats were given 60 training trials in a multiple continuous reinforcement (CRF) schedule under either drug (p-chloroamphetamine, 3.5 mg/kg intraperitoneally) or placebo conditions. A comparable 60-trial testing phase followed in which half of the Ss continued under the training injection conditions and the other half were switched to the alternative injection. Drugged Ss displayed slightly inferior discrimination performance in training as a result of elevated responding in extinction. No differences between groups were obtained on CRF performance. In the testing phase, extinction performance was similarly affected by both concurrent testing and prior training-phase conditions. Data suggest that p-chloroamphetamine administration results in a selective disruption of responding to stimuli correlated with nonreward and that this effect tends to persist for long periods of time. (21 ref)—*Journal abstract.*

2675. Rummo, Nicholas & Sarlanis, Kiriako. (Environmental Protection Agency, Chapel Hill, NC) **The effect of carbon monoxide on several measures of vigilance in a simulated driving task.** *Journal of Safety Research*, 1974(Sep), Vol 6(3), 126-130.—In a 2-hr vigilance task in a driving simulator, Ss under low blood levels of carbon monoxide (CO) were significantly slower in responding to lead car speed changes and nonsmokers made significantly fewer steering wheel corrections. There was no decrement under CO in responding to a dashboard warning light or in maintenance of lane position.

2676. Salvatore, Santo. (Brown U, Hunter Lab of Psychology) **Performance decrement caused by mild carbon monoxide levels on two visual functions.** *Journal of Safety Research*, 1974(Sep), Vol 6(3), 131-141.—Used 6 20-27 yr old volunteers to determine the effects of mild levels of carbon monoxide (CO) on the time necessary to detect static and dynamic visual targets. In the static phase, S adapted for 1 min to an illumination of 17 ft-L and detected low-contrast targets when the ambient illumination dropped to .02 ft-L. In the dynamic phase, the illumination was constant at 6 ft-L and S detected the targets moving into the visual field. There was a significant decrement in target detection time due to CO for the dynamic task, indicating some constriction of the visual field. The CO-related decrement for the static task was not statistically significant.—*Journal abstract.*

2677. Sandman, Curt A.; Beckwith, Bill E.; Gittis, M. M. & Kastin, Abba J. (Ohio State U) **Melanocyte-stimulating hormone (MSH) and overtraining effects on extradimensional shift (EDS) learning.** *Physiology & Behavior*, 1974(Jul), Vol 13(1), 163-166.—Treated 24 male Holtzman albino rats with MSH or a diluent control solution and tested them with a visual discrimination problem. After acquisition of the visual discrimination, half of the Ss were overtrained, and all of the Ss were tested with a spatial EDS problem. Overtraining significantly disrupted performance of the EDS. A subproblem analysis indicated that MSH resulted in inferior performance of the changed dimension of the EDS. Overtraining together with MSH treatment resulted in the poorest performance of the changed dimension of EDS. Thus, overtraining and MSH were not additive, and it is possible that MSH may exert a paradoxical effect on behavior under certain conditions.—*Journal abstract*.

2678. Sanger, D. J.; Key, Marilyn & Blackman, D. E. (U Birmingham, England) **Differential effects of chlor-diazepoxide and d-amphetamine on responding maintained by a DRL schedule of reinforcement.** *Psychopharmacologia*, 1974, Vol 38(2), 159-171.—5 male hooded rats pressed a lever and obtained food pellets on a schedule of differential reinforcement of low rates (DRL) which required that responses were spaced at least 15-sec apart in order for them to produce reinforcement. When responding had stabilized, the effects of intraperitoneal dextroamphetamine and chlor-diazepoxide were assessed. Low doses of both drugs increased response rates while higher doses decreased them. Reinforcement frequency showed a dose related decrease after both drugs. When interresponse times (IRTs) were analyzed it was found that both drugs shifted the peak of the distribution towards shorter IRTs but that chlor-diazepoxide also produced a specific increase in the percentage of responses after very short IRTs (bursts). When IRTs were divided into those following a reinforced response (hit) and those following a nonreinforced response (miss) it was found that bursts normally followed only misses and that chlor-diazepoxide consistently increased the number of bursts following misses only. Amphetamine did not affect bursts in any consistent way. (24 ref)—*Journal abstract*.

2679. Schmitt, H.; Le Douarec, J.-C. & Petillot, N. (Ecole de Médecine, Paris, France) **Antagonism of the antinociceptive action of xylazine, an  $\alpha$ -sympathomimetic agent, by  $\alpha$ -adrenoceptor and cholinergic blocking agents.** *Neuropharmacology*, 1974(May), Vol 13(5), 295-303.—Results of a study with rats and mice suggest the involvement of receptors with properties in common with classical  $\alpha$ -adrenoceptors in the antinociceptive action of xylazine administered intraperitoneally and intracerebroventricularly, but these receptors seem to be distinct. In the hot-plate test, central cholinergic mechanisms could be involved as well as peripheral mechanisms. (24 ref)

2680. Schmitt, H.; Le Douarec, J.-C. & Petillot, N. (Ecole de Médecine, Paris, France) **Antinociceptive effects of some  $\alpha$ -sympathomimetic agents.** *Neuropharmacology*, 1974(May), Vol 13(5), 289-294.—Intraperitoneal xylazine, clonidine, and LD2855 were potent

antinociceptive agents on the hot-plate test in mice and on the test of electrical stimulation of rat's tail. In contrast, classical  $\alpha$ -sympathomimetic agents naphazoline, tetryzoline, and oxymetazoline were devoid of any antinociceptive action by parenteral route. However, intracerebroventricular administration of naphazoline in rats and of naphazoline, tetryzoline, and oxymetazoline in mice induced a strong antinociceptive effect. (20 ref)

2681. Seiser, Richard L. & Houser, Vincent P. (VA Hosp. Psychotropic Drug Lab, Perry Point, MD) **Effects of scopolamine methylbromide on shock-induced gastric lesions in the unrestrained rat.** *Physiology & Behavior*, 1974(Jul), Vol 13(1), 147-151.—In 2 experiments with a total of 130 male Sprague-Dawley rats, Ss were subjected to a 6-hr shock stress session. A perch-contingent yoked design compared the degree of gastric pathology exhibited in Ss subjected to an avoidance-avoidance conflict, with yoked Ss receiving equivalent amounts of noncontingent shock. There were no differences in the amount of gastric lesion formation produced by these 2 procedures. Scopolamine methylbromide (.50 and 1.0 mg/kg) significantly decreased ulcer development (i.e., percentage of Ss exhibiting pathology, number of lesions per S, and severity of lesioning) in all groups tested. (19 ref)—*Journal abstract*.

2682. Simpson, Lance L. (Columbia U, Coll of Physicians & Surgeons) **The effects of lithium and physostigmine on rat brain acetylcholinesterase activity.** *Psychopharmacologia*, 1974, Vol 38(2), 145-150.—Conducted studies with male Wistar rats to determine whether lithium could inhibit acetylcholinesterase (AChE) and whether repeated injections of physostigmine, a known cholinesterase inhibitor, could result in tolerance. It was found that lithium had no anticholinesterase activity in vivo (100 or 200 mg/kg intraperitoneal LiCl) and slight anticholinesterase activity in vitro. The latter effect was evident only under markedly unphysiological conditions (i.e., concentrated lithium and dilute acetylcholinesterase). It was also found that repeated injections of physostigmine (.75 mg/kg) did not result in tolerance to the anti-cholinesterase effects of the drug. A single challenge dose of physostigmine in vivo or a series of concentrations of physostigmines physostigmine vitro resulted in similar inhibition of AChE from Ss which had or had not received a 5-day regimen of repeated physostigmine injections. The relationship of these findings to the treatment of mania is discussed.—*Journal abstract*.

2683. Snowden, Charles T. & Wampler, Richard S. (U Wisconsin, Madison) **Effects of lateral hypothalamic lesions and vagotomy on meal patterns in rats.** *Journal of Comparative & Physiological Psychology*, 1974(Sep), Vol 87(3), 399-409.—Studied meal patterns with liquid diets in 4 female Carworth CFE albino rats with lateral hypothalamic (LH) lesions and in 4 Ss with sham lesions, both before and after vagotomy. LH Ss reduced total intake following lesions but showed no differences from controls after vagotomy on measures of total daily intake, mean meal size, and frequency of feeding. Identical frequency distributions of meal sizes and intermeal interval durations were found in LH and control Ss after vagotomy. However, although sham-lesioned Ss showed significant positive correlations

between meal size and subsequent intermeal-interval durations in all phases of the experiment, the LH Ss showed no such correlation following vagotomy. Thus, indices of microregulatory controls may be more sensitive in indicating feeding deficits. (25 ref)—*Journal abstract*.

2684. Stadnicki, Stanley W.; Schaeppi, Ulrich; Rosenkrantz, Harris & Braude, Monique C. (Mason Research Inst, Worcester, MA) **Crude marihuana extract: EEG and behavioral effects of chronic oral administration in rhesus monkeys.** *Psychopharmacologia*, 1974, Vol 37(3), 225-233.—Treated 3 rhesus monkeys daily with oral crude marihuana extract (CME) containing  $\Delta^9$ -tetrahydrocannabinol (THC), cannabidiol, and cannabinol, but no  $\Delta^8$ -THC. CME with the equivalent of THC 12.5 mg/kg or more caused sedation, ptosis, ataxia, huddled posture, spontaneous jerky body movements and increased EEG synchrony without an initial phase of increased motor activity. Thereafter, THC 12.5 mg/kg in 2 Ss produced specific EEG changes including the appearance of protracted trains of activity in thalamus and cerebellar nuclei. THC 37.5 mg/kg or more, in all 3 Ss, caused slow waves in hippocampus, amygdala, and septum. EEG manifestations after oral treatment were therefore different from those previously observed following intravenous injection or smoke inhalation. The 2 Ss that became tolerant after 50 daily treatments with THC 37.5 mg/kg responded to termination of treatment with withdrawal signs manifested by increased aggressiveness. One of the 2 exhibited "hallucinations" and increased periods of EEG desynchronization. Withdrawal signs were, therefore, more severe for behavioral than for EEG effects. (17 ref)—*Journal abstract*.

2685. Stewart, W. J.; Blampied, N. M. & Hughes, R. N. (U Tasmania, Hobart) **The effects of scopolamine on performance on a geometric progressive ratio schedule.** *Psychopharmacologia*, 1974, Vol 38(1), 55-66.—Trained 6 female rats to respond on a geometric progressive ratio schedule until performance was stable. They were then injected intraperitoneally with the anticholinergic drug scopolamine at doses of .05, .1, .25, 1.0 and 2.0 mg/kg. 2 controls were administered atropine methyl nitrate (1-20 mg/kg). Increasing doses of scopolamine typically produced first an increase, then a decrease in behavior compared with baseline levels, measured by total number of responses, total number of reinforcements, and final completed ratio per session. Atropine methyl nitrate had no effect on the behavior of the control Ss. Results indicate that the effects of scopolamine are due to its central action. The inverted-U dose-response curve found for scopolamine resembled that found for chlor-diazepoxide, phenobarbital, and dextroamphetamine on progressive schedules. (35 ref)—*Journal abstract*.

2686. Stoll, Raymond E.; Paolino, Ronald M. & Bousquet, William F. (Purdue U) **Possible role of pheromones in modifying drug response in the mouse.** *Life Sciences*, 1974(Aug), Vol 15(3), 543-549.—Significant differences in the duration of response of 22-day-old male and female Swiss-Webster mice to hexobarbital and zoxazolamine were obtained, within sex, depending upon whether group-caged Ss were housed in rooms with Ss of the same or opposite sex. As there was no physical contact between Ss, these findings suggest that pheromones or other modes of sexual communication may have been operative.—*Journal abstract*.

2687. Summy-Long, Joan & Severs, Walter B. (Pennsylvania State U, Coll of Medicine, Hershey) **Angiotensin and thirst: Studies with a converting enzyme inhibitor and a receptor antagonist.** *Life Sciences*, 1974(Aug), Vol 15(3), 569-582.—Produced thirst in implanted male Sprague-Dawley rats by relative cellular dehydration or hypovolemia. An angiotensin receptor antagonist (sar(1)-ala(8)-angiotensin II P-113) or a converting enzyme inhibitor SQ-20, 881, SQ was given to thirsty Ss by intracerebroventricular (IVT) or peripheral routes. P-113 infused intravenously or injected IVT did not alter the drinking response to either thirst stimulus. The latter treatment reduced the drinking response to IVT angiotensin II ( $p < .005$ ). SQ given intramuscularly, IVT, or by both routes did not alter relative cellular dehydration thirst. Injection of SQ IVT did alter hypovolemic thirst, whereas a significantly enhanced response occurred after intramuscular SQ. The IVT treatment with SQ markedly reduced drinking after IVT angiotensin I. Data demonstrate that inhibition of angiotensin receptors or converting enzyme does not prevent appropriate drinking responses to primary thirst stimuli. (28 ref)—*Journal abstract*.

2688. Takayanagi, Issei; Sato, Takao & Takagi, Keijiro. (U Tokyo, Faculty of Pharmaceutical Sciences, Japan) **Action of 5-hydroxytryptamine on electrical activity of Auerbach's plexus in the ileum of the morphine dependent guinea pig.** *European Journal of Pharmacology*, 1974(Jul), Vol 27(2), 252-254.—Guinea pigs were made morphine dependent by daily subcutaneous doses of morphine hydrochloride. Effective concentrations of 5-hydroxytryptamine on Auerbach's plexus of Ss in the abstinence syndrome were significantly smaller than those of normal and morphine-treated Ss, while the responses to nicotine and caerulein were unchanged. Results suggest that withdrawal of morphine excites the M-receptors in Auerbach's plexus.

2689. Ten Ham, Martinijn & De Jong, Yeb. (National Inst of Public Health, Bilthoven, Netherlands) **Tolerance to the hypothermic and aggression-attenuating effects of  $\Delta^9$ - and  $\Delta^8$ -tetrahydrocannabinol in mice.** *European Journal of Pharmacology*, 1974(Sep), Vol 28(1), 144-148.—Investigated the effects of repeated administration of  $\Delta^9$ - and  $\Delta^8$ -tetrahydrocannabinol ( $\Delta^9$ - and  $\Delta^8$ -THC) on temperature and aggression of 60 isolated aggressive 60 male Swiss-Webster mice. In Exp I intraperitoneal  $\Delta^9$ -THC, 10 mg/kg, caused significant hypothermia and diminished aggression. Acute tolerance to the hypothermic effect developed which could be overcome by doubling the dose. In the same Ss no tolerance to the aggression inhibiting effect was seen. In Exp II  $\Delta^9$ - and  $\Delta^8$ -THC were compared. Both compounds caused a dose-dependent decrease of body temperature. The effect of  $\Delta^9$ -THC on body temperature was about 1.5 times as strong as that of  $\Delta^8$ -THC. Tolerance to the hypothermic effect appeared in 1 day for the 10 mg/kg dose and in about 3 days in the 25 mg/kg group. (17 ref)—*Journal abstract*.

2690. Tonge, Sally R. (Liverpool Polytechnic, School of Pharmacy, England) **Noradrenaline and 5-hydroxytryptamine metabolism in six areas of rat brain during post-amphetamine depression.** *Psychopharmacologia*,

1974, Vol 38(2), 181-186.—Mature male Wistar rats were given dextroamphetamine sulphate (200 mg/l) in the drinking water for a period of 3 wks. The drug was then withdrawn, and the Ss were killed 12, 24, 36, and 48 hrs later. Pronounced behavioral depression was observed 12 hrs after the withdrawal of amphetamine; 24 hrs after withdrawal, behavior was substantially normal but depression recurred at 36 hrs. Recovery appeared to be complete after 48 hrs. Fluorimetric determinations showed that noradrenaline (NA) and 5-hydroxytryptamine (5-HT) concentrations were reduced by the chronic administration of amphetamine in the cortex, hippocampus, thalamus-hypothalamus, and midbrain. NA concentrations were also reduced in the pons-medulla. 12 and 36 hrs after withdrawal, there was a further reduction in NA concentrations in the cortex, hippocampus, midbrain, and striatum. 5-HT concentrations in the cortex and striatum were lower 12 and 36 hrs after the withdrawal than during chronic amphetamine treatment; 36 hrs after withdrawal, concentrations in the hippocampus and the pons-medulla were also lower than during drug treatment.—*Journal abstract.*

2691. Trabucchi, M.; Cheney, D.; Racagni, G. & Costa, E. (NIMH Lab of Preclinical Pharmacology, St Elizabeths Hosp, Washington, DC) **Involvement of brain cholinergic mechanisms in the action of chlorpromazine.** *Nature*, 1974(Jun), Vol 249(5458), 664-666.—Monitored the effect of chlorpromazine and haloperidol on the turnover rate of acetylcholine (ACh) in the occipital cortex and striatum of male Sprague-Dawley rats to determine whether when dopamine receptors are blocked, the synthesis of ACh in the rat brain is increased. The amount of ACh synthesized in the striatum of rats receiving chlorpromazine or haloperidol was significantly increased, but there was no similar increase in the occipital cortex. Data suggest that these 2 drugs affect some neuronal mechanism that is important in the control of striatal ACh synthesis and less important in occipital cortex ACh synthesis. (19 ref)

2692. Trojnar, W.; Cytawa, J.; Frydrychowski, A. & Luszawska, D. (Gdańsk Medical School, Poland) **Intragastric self-administration of morphine as a measure of addiction.** *Psychopharmacologia*, 1974, Vol 37(4), 359-364.—Results of experiments carried out on 15 male Wistar albino rats show that instrumental conditioning reinforced with direct intragastric infusion of morphine could be used for the investigation of addiction. (19 ref)

2693. Truitt, Edward B. & Braude, Monique C. (George Washington U, Medical School) **Preclinical pharmacology of marihuana.** In R. J. Gibbons et al (Eds), *Research advances in alcohol and drug problems: I*. New York, NY: John Wiley & Sons, 1974. xvii, 428 p.—Presents a review of recent research on the pharmacological actions (e.g., EEG, behavioral, and neurochemical effects), tolerance, and possible therapeutic uses of marihuana in both animal and human Ss. (233 ref)

2694. Vetulani, Jerzy; Reichenberg, Krystyna & Wiszniewska, Grazyna. (Vanderbilt U, Medical School) **The ineffectiveness of desipramine pretreatment on behavioral effects of 6-hydroxydopamine in nialamide-pretreated rats.** *Psychopharmacologia*, 1974, Vol 38(2), 173-180.—Nonanesthetized male Wistar rats pretreated

with intraperitoneal nialamide were injected intravenicularly with 6-hydroxydopamine (6-OHDA) into both lateral brain ventricles. Some Ss received desipramine 1 hr before 6-OHDA. 6-OHDA increased the locomotor activity and produced behavioral stimulation lasting for several hours. On the following days the open-field performance of the Ss receiving 6-OHDA was markedly depressed. Half of the Ss receiving 6-OHDA died between Day 3 and Day 10 after the injection. Desipramine pretreatment did not affect the behavioral changes or mortality produced by 6-OHDA, although it counteracted the depletion of brain noradrenaline brought about by 6-OHDA. It is concluded that the behavioral changes observed after 6-OHDA injection in nialamide-pretreated Ss are related to the action of 6-OHDA on dopamine and not on noradrenaline neurons. (31 ref)—*Journal abstract.*

2695. Warburton, D. M. (U Reading, England) **The effects of scopolamine on a two-cue discrimination.** *Quarterly Journal of Experimental Psychology*, 1974(Aug), Vol 26(3), 395-404.—Trained a total of 40 Sprague-Dawley albino rats with a tone, light or tone-light combination as the discriminative stimulus. These groups were tested after intraperitoneal doses of scopolamine; it was found that groups trained with a single cue were more sensitive to the drug than double-cue groups, although their predrug responding was similar. A similar pattern was found among individuals in the double-cue groups in which there was a significant correlation between dependency on a single cue (as shown in transfer tests) and drug sensitivity. Results are interpreted in terms of scopolamine-induced changes in stimulus sensitivity produced by a modification of the neural mechanisms controlling attention. (24 ref)—*Journal abstract.*

2696. Wauquier, Albert; Niemegeers, Carlos J. & Lal, Harbans. (Janssen Pharmaceutica, Research Lab, Beerse, Belgium) **Differential antagonism by naloxone of inhibitory effects of haloperidol and morphine on brain self-stimulation.** *Psychopharmacologia*, 1974, Vol 37(4), 303-310.—Haloperidol (.16 mg/kg or morphine sulfate (40 mg/kg), injected subcutaneously, completely suppressed barpressing for brain self-stimulation in adult male Wistar rats implanted with electrodes in the lateral hypothalamus. Haloperidol also caused catalepsy and ptosis while morphine produced catalepsy with exophthalmia. Naloxone in a dose (5 mg/kg) which was ineffective when given alone, differentially reversed the morphine effects but was without any reversing influence on the actions of haloperidol. (16 ref)—*Journal abstract.*

2697. Weisinger, Richard S.; Parker, Lorne F. & Skorupski, Joseph D. (U Melbourne, Vic, Australia) **Conditioned taste aversion and specific need states in the rat.** *Journal of Comparative & Physiological Psychology*, 1974(Oct), Vol 87(4), 655-660.—In 3 experiments, a total of 151 female Wistar rats were allowed to consume either sucrose or saline prior to being made ill by injection of either insulin or formalin, or by exposure to X rays. A 2-bottle preference test between sucrose and saline revealed that formalin was an effective agent in conditioned aversions to sucrose but not to saline. Similarly, injections of insulin were effective in producing conditioned aversions to saline but not to sucrose. X-

irradiation produced strong aversions to either solution. Results are discussed with regard to the specific need states that insulin and formalin produce. (20 ref)—*Journal abstract*.

2698. Wilcox, George L.; Andry, Diane K. & Luttges, Marvin W. (U Colorado) **Cycloheximide effects on electroencephalographic and evoked responses in mice.** *Behavioral Biology*, 1974(Sep), Vol 12(1), 81-92.—40 implanted mice were treated with various intraperitoneal doses of cycloheximide (CXM) 30 min prior to tests using a sequence of slowly repeated light flashes interrupted by a brief auditory stimulus. Both evoked and EEG responses were recorded. The tests were repeated 24 hrs later without additional drug treatments. CXM, especially in high doses, caused alterations in the Ss' brain electrical activity. The alterations persisted for at least 24 hrs after CXM treatments. The time course of these effects did not correspond to the time course of CXM effects on brain protein synthesis or polysome disaggregation. Results suggest that memory deficits often associated with the protein-synthesis inhibition by CXM may be due, in part, to disturbances in the electrical activity of the brain. While not critical for learning or short-term memory, these electrical alterations may be related to neural mechanisms of long-term memory storage and retrieval. (20 ref)—*Journal abstract*.

2699. Wishart, Thomas B. & Walls, Elwood K. (U Saskatchewan, Saskatoon, Canada) **Reduction of stimulus-bound food consumption in the rat following amphetamine administration.** *Journal of Comparative & Physiological Psychology*, 1974(Oct), Vol 87(4), 741-745.—Studied the effects of intraperitoneal administration of dextroamphetamine on stimulus-bound food consumption in 30 male satiated rats. Lateral hypothalamic stimulation which resulted in feeding was either programmed to occur at regular intervals or delivered by the S's response (self-stimulation). Stimulus-bound food intake was reduced by dextroamphetamine, 3.0 or 4.0 mg/kg dosages being sufficient to cause almost complete anorexia. Reflexive sniffing and chewing of food and self-stimulation behaviors were unaffected. Results indicate that amphetamine selectively interacts with the adrenergic feeding system of the lateral hypothalamus to produce an inhibition of food consumption. (17 ref)—*Journal abstract*.

2700. Wong, David T. et al. (Eli Lilly & Co, Lilly Research Lab, Indianapolis, IN) **A selective inhibitor of serotonin uptake: Lilly 110140, 3-(p-trifluoromethylphenoxy)-N-methyl-3-phenylpropylamine.** *Life Sciences*, 1974(Aug), Vol 15(3), 471-479.—Results of tests show that Lilly-110140 is a highly selective inhibitor of serotonin uptake into synaptosomes of whole rat brain. The drug should be useful in studying the function of serotonergic neurons and may be helpful in clarifying the role of serotonin in certain types of mental depression. (17 ref)

2701. Woods, James H. & Tessel, Richard E. (U Michigan, Medical School) **Fenfluramine: Amphetamine congener that fails to maintain drug-taking behavior in the rhesus monkey.** *Science*, 1974(Sep), Vol 185(4156), 1067-1069.—Intravenous fenfluramine, over a dose range of .003-3 mg/kg of body weight, failed to maintain self-injection behavior in 9 rhesus monkeys that had

initiated and maintained responding for cocaine or methohexital. This absence of a positive reinforcing effect could not be attributed to a slow onset of drug effect or to the use of behaviorally inactive doses. It is concluded that fenfluramine, because of its distinctive properties, may produce fewer problems of human abuse than do amphetamine-type agents. (22 ref)—*Journal abstract*.

2702. Zis, A. P.; Fibiger, H. C. & Phillips, A. G. (U British Columbia, Div of Neurological Sciences, Vancouver, Canada) **Reversal by L-dopa of impaired learning due to destruction of the dopaminergic nigro-neostriatal projection.** *Science*, 1974(Sep), Vol 185(4155), 960-962.—18 male Wistar rats receiving bilateral stereotaxic intracerebral injections of 6-hydroxydopamine into the zona compacta of the substantia nigra failed to learn a 1-way active avoidance response. 16 other Ss served as controls. Small doses of levodopa (1.5 mg/kg) in combination with a peripheral decarboxylase inhibitor reversed this impairment in the experimental Ss. Ss with lesions which acquired the avoidance response during levodopa administration retained this response when drug treatment was discontinued. Results suggest that the dopaminergic nigro-neostriatal projection serves a critical function in the acquisition of learned instrumental responses. (32 ref)—*Journal abstract*.

2703. Zornetzer, S. F.; Gold, M. S. & Hendrickson, J. (U Florida, Medical School) **Alpha-methyl-p-tyrosine and memory: State-dependency and memory failure.** *Behavioral Biology*, 1974(Sep), Vol 12(1), 135-141.—Evaluated the effects of  $\alpha$ -methyl-p-tyrosine (AMPT) on memory of a single-trial inhibitory avoidance response in a total of 130 male Swiss-Webster mice. AMPT did not prevent the establishment of memory storage nor did it prevent retrieval of either short- or long-term memory. AMPT did produce a state-dependency, however, such that a mismatch between the drug state during training and the drug state during retention testing produced an apparent amnesia. (16 ref)—*Journal abstract*.

## ANIMAL PSYCHOLOGY

2704. Baptista, Luis F. (Museum of Vertebrate Zoology, Berkeley, CA) **The effects of songs of wintering white-crowned sparrows on song development in sedentary populations of the species.** *Zeitschrift für Tierpsychologie*, 1974(Feb), Vol 34(2), 147-171.—Studied song dialects of the white-crowned sparrow (*Zonotrichia leucophrys nuttalli*) in California. 7 birds, out of approximately 450 sampled, sang songs typical of the migratory subspecies *pugetensis* which winters in the area. These birds sang from 1 to 3 themes of *nuttalli* and/or *pugetensis*. One individual also sang a song including syllables taken from songs of both these races. Based on morphological and behavioral grounds, 6 of these birds were identified as *nuttalli* presumably "misimprinted" with songs sung by wintering individuals of *pugetensis*. 5 males were mated, 4 of them to females of *nuttalli*. 2 of these females, after injection with testosterone, sang the local *nuttalli* dialects. This indicates that the songs learned by females were not influenced by the "atypical" themes sung by their mates, and that singing

the "incorrect" song by the males proved no barrier to their finding mates of the local subspecies. Possible explanations for the phenomenon of song "misimprinting" are discussed. (German summary) (36 ref)—*Journal summary*.

2705. Baylis, Jeffrey R. (Museum of Vertebrate Zoology, Berkeley, CA) **The behavior and ecology of *Herotilapia multispinosa* (Teleostei, cichlidae).** *Zeitschrift für Tierpsychologie*, 1974(Feb), Vol 34(2), 115-146. —Describes the ecology and the feeding, defensive, and social behavior of the small cichlid fish native to Central America.

2706. Crowell, Charles R. & Brown, Judson S. (U Iowa) **An electrifiable restraining cage for small animals.** *American Journal of Psychology*, 1973(Dec), Vol 86(4), 851-854. —Describes an adjustable restraining device for small animals which provides for rapid confinement and release, minimizes discomfort to the S, and does not require removing the S's hair or using special electrodes to present shock.

2707. Guillery, R. W. (U Wisconsin, Medical School) **Visual pathways in albinos.** *Scientific American*, 1974(May), Vol 230(5), 44-54. —Albinos of several mammalian species exhibit genetic anomalies in which reduced retinal pigmentation is combined with congenital visual system abnormalities, including abnormally layered lateral geniculate nuclei and termination of some optic nerve fibers in the wrong hemisphere of the brain. Several features of the central visual pathways in these anomalous individuals are described. The relation between the pigment deficit and the abnormality of the visual pathway is discussed. —P. Tolin.

2708. Hara, M. (Tokyo U of Education, Faculty of Education, Japan) **[Imprinting in ducklings: Influence of movement confinement.]** (Japn) *Annual of Animal Psychology*, 1973(Dec), Vol 23(1), 39-42. —Confirmed the effect on imprinting in ducklings of the following response during initial exposure. 40 Ss 14-20 hrs old were placed in a runway for 20 min. Ss that were allowed to follow a moving blue cube demonstrated, in a test 48 hrs later, the following response more frequently and for longer durations. The Ss that were prevented from following in the initial exposure did not show imprinting any more than control groups that were not exposed to the cube initially. —S. Nakajima.

2709. Hopkins, Carl D.; Rossetto, Michelangelo & Lutjen, Ann. (Rockefeller U, New York, NY) **A continuous sound spectrum analyzer for animal sounds.** *Zeitschrift für Tierpsychologie*, 1974(Mar), Vol 34(3), 313-320. —Employed a continuous spectrum analyzer for the analysis of vocalizations of birds and other animals. Use of a commercially available, real-time spectrum analyzer required the construction of a display system which is described. Sound spectrograms are produced of comparable quality to those of traditional spectrum analyzers, but the system offers greater flexibility in analysis parameters and the advantages of continuous operation. (German summary)—E. Furchtgott.

2710. Hughes, B. O.; Wood-Gush, D. G. & Jones, R. Moreley. (ARC Poultry Research Ctr, Edinburgh, Scotland) **Spatial organization in flocks of domestic fowls.** *Animal Behaviour*, 1974(May), Vol 22(2), 438-445.

—Describes 7 experiments, with 2 flocks of 600 female birds of the Shaver 288 strain, in which the movements of individual birds were recorded by marking different samples with colored tags and photographing the flock at fixed intervals. The films were analyzed, the positions of the marked Ss were plotted, and the probability of the observed distributions occurring by chance was calculated. The movements of individuals lay on a continuum ranging from apparent randomness at one extreme to clear nonrandomness at the other. In all experiments most Ss were sighted in most camera fields, indicating that their movements were incompatible with the accepted definition of a delineated home range. Results are explained by postulating strain differences in aggressiveness and assigning an important role to illumination level. —*Journal abstract*.

2711. Hutcheson, J. Stanford & Mills, Kenneth C. (U North Carolina, Chapel Hill) **A compact and inexpensive drinkometer for use with small animals.** *Physiology & Behavior*, 1974(Jul), Vol 13(1), 179-181. —Describes a device which permits electrical isolation of the animal from the recording system. Data correlating licks with daily water intake (ml) and temporal consumption patterns are provided for several Long Evans rats.

2712. Lynch, Carol B. (Wesleyan U) **Environmental modification of nest-building in the white-footed mouse, *Peromyscus leucopus*.** *Animal Behaviour*, 1974(May), Vol 22(2), 405-409. —Exposure of 110 white-footed mice to low ambient temperature (5° vs 26°C) during a 5-day test resulted in the building of larger nests. The weight of cotton used by the S was employed as an index of nest size. Ss which had been acclimated to 5°C for 6 wks prior to testing built larger nests at 5°C and smaller nests at 26°C than did warm-acclimated Ss. Warm-acclimated Ss maintained for 6 wks under 9 hrs daily light built larger nests at both 5 and 26°C than did Ss kept under 16 hrs light. This pattern of response to environmental conditions approximating winter (low ambient temperature and short photoperiod) indicates that nesting is a component of the physiological-behavioral complex of cold adaptation. (15 ref)—*Journal abstract*.

2713. Mason, P. R. (South African Inst for Medical Research, Johannesburg) **Size and other factors determining planarian behaviour.** *Journal of Biological Psychology*, 1973(Dec), Vol 15(2), 8-13. —Conducted experiments on the planarian *Dugesia neumani* to determine its normal kline-kinetic activity. Results indicate that (a) the size of the planarian used exerted a strong influence on the findings; (b) seasonal variations in activity were apparent; and (c) there were no variations due to temperature, experimental starting time, and lunar cycles.

2714. Mueller, Helmut C. (U North Carolina, Chapel Hill) **Food caching behaviour in the American kestrel (*Falco sparverius*).** *Zeitschrift für Tierpsychologie*, 1974(Feb), Vol 34(2), 105-114. —Conducted laboratory studies of food-caching behavior and attempts to retrieve food by *Falco sparverius* (falcon). In spite of severe restraints on the time available to the Ss, caching occurred on 63% of the available opportunities and attempts to retrieve were observed on 65% of the available opportunities. Errors in retrieving behavior were uncommon. Caching and retrieving behavior

appeared spontaneously in hand-reared birds and persisted for as long as 3 yrs without any reinforcement. Caching appeared to be correlated with deprivation, but retrieving did not appear to be correlated with deprivation interval. Neither caching nor deprivation appeared to show a circadian rhythm. Caching may be influenced by previous hunger and frustration, while retrieving may be influenced by hunger and anticipation of food. Intact mice, which are better for storage, were cached more frequently, and retrieving attempts were made more often than with skinned and eviscerated mice, which desiccate rapidly. (German summary) (33 ref)—*Journal summary*.

2715. Murphree, Oddist D. & Johnson, Jack B. (VA Hosp, North Little Rock, AR) **An inexpensive activity measuring device for small animals.** *Pavlovian Journal of Biological Science*, 1974(Jul-Sep), Vol 9(3), 169-171. —Describes a device which utilizes the tilting of balanced cages to actuate a single microswitch coupled to an impulse counter for each cage. The system has functioned well for several years.

2716. Noirot, Elaine. (Lab de Psychologie expérimentale, Bruxelles, Belgium) **Nest-building by the virgin female mouse exposed to ultrasound from inaccessible pups.** *Animal Behaviour*, 1974(May), Vol 22(2), 410-420. —Observations of 8 naive virgin female albino mice indicate that when they were exposed to an inaccessible litter, so that they perceived the odor and the ultrasounds from the pups, their nest-building behavior underwent changes different from changes occurring in 8 controls exposed to an inaccessible adult female. Ss exposed to a litter built their nest as near as possible to the pups. Other characteristics of their nest-building behavior were influenced differently according to the type of ultrasound that the pups were emitting. In a condition where pups were mainly calling in response to cold, Ss built heavier nests than did controls. When calls in response to handling were given by the pups, Ss built lighter nests than controls. There was some suggestion that the Ss exposed to ultrasounds from handled pups tended to chew the nest-material more than either controls or Ss exposed to ultrasound from cooled pups. (18 ref) —*Journal abstract*.

2717. Rowe-Rowe, D. T. (Natal Parks, Game & Fish Preservation Board, South Africa) **Flight behaviour and flight distances of blesbok.** *Zeitschrift für Tierpsychologie*, 1974(Feb), Vol 34(2), 208-211. —Recorded flight distances of 1 male and 4 female adult blesbok in a small nature reserve in Africa.

2718. Rusak, Benjamin & Zucker, Irving. (U California, Berkeley) **Fluid intake of rats in constant light and during feeding restricted to the light or dark portion of the illumination cycle.** *Physiology & Behavior*, 1974(Jul), Vol 13(1), 91-100. —In Exp 1, 14 mature Sprague-Dawley rats restricted to eating and drinking during the light phase of a 12:12 light-dark (L-D) cycle (L-drinkers) consumed much smaller volumes of saccharin and NaCl than did 14 Ss whose feeding and drinking was restricted to the dark phase (D-drinkers). The patterns of fluid intake within the respective 12-hr feeding periods were markedly different for L- and D-drinkers, and the food-fluid ratios were significantly lower for D- than for L-drinkers. It is concluded that illumination affects fluid

intake independently of changes in food intake. In Exp II, intake of a wide concentration range of saccharin solutions was decreased in 20 male ad lib fed Ss housed in constant light (L-L); differences in fluid intake between the L-L and L-D groups varied directly with the hedonic value of the saccharin solutions. In Exp III, 8 L- and 8 D-drinkers did not differ in their preference for saccharin over water in 2-bottle tests. The necessity for controlling and specifying environmental illumination in studies of ingestive behavior is emphasized, and various methodological considerations related to illumination cycles are discussed. (27 ref)—*Journal abstract*.

2719. Smotherman, William P. et al. (Northern Illinois U) **Maternal responses to infant vocalizations and olfactory cues in rats and mice.** *Behavioral Biology*, 1974(Sep), Vol 12(1), 55-66. —In 2 experiments, 10 lactating female Long-Evans rats and 14 lactating female C57BL/10 mice, respectively, were tested for retrieval of young in a Y-maze using the home cage as a start box. Retrieval-eliciting stimuli compared were (a) a pup emitting ultrasounds, (b) a tape loop of neonatal vocalizations, (c) a chilled pup which could not emit ultrasounds, and (d) an empty maze arm to control for random and/or exploratory activity. For both rats and mice the absence of any olfactory cue in the maze arms was accompanied by an absence of differential choice behavior. Given the presence of olfactory cues neonatal ultrasounds were effective directional cues for retrieval. The rat seemed incapable of utilizing olfactory cues alone for directional information, whereas the mouse utilized vocalizations and olfactory cues equally well. (18 ref)—*Journal abstract*.

2720. Tanaka, Toshihiko & Ono, Yoshiaki. (Kagawa Prefectural Science Museum, Japan) **[A preliminary experiment on ant lion behavior in removing obstacles from the nest.]** (Japn) *Annual of Animal Psychology*, 1973(Dec), Vol 23(1), 27-38. —Studied obstacle-removing behavior in 130 larvae of *Hagenomyia micans* and 22 larvae of *Myrmeleon formicarius*. The obstacle, a piece of rubber eraser, was placed in the middle of the nest, and the distance that the object had been moved was measured 1 day later. The size of obstacle removed was related to body size of the Ss, and the distance removed was proportional to nest size. *M. formicarius* demonstrated the removal behavior less frequently than *H. micans*. (English summary)—*S. Nakajima*.

2721. Vezie, Tom & Martin, R. Chris. (U Missouri, Kansas City) **A method for identifying individual subjects within a group of fish.** *Bulletin of the Psychonomic Society*, 1974(Aug), Vol 4(2-A), 87-88. —To identify individuals within a group of 38 fathead minnows, several dyes were tested for the distinctiveness of marking, duration of marking, toxicity, and effects upon individual and social behavior. Several of the dyes, including common food coloring, proved to be effective.

2722. Wallen, Kurt & Glickman, Stephen E. (U California, Berkeley) **Effect of peripheral anosmia on ventral rubbing in the gerbil.** *Behavioral Biology*, 1974(Aug), Vol 11(4), 569-572. —Tested 8 male gerbils (*Meriones unguiculatus*) for rate of ventral rubbing before and after Ss were rendered peripherally anosmic by bathing the nasal epithelium with a 5% solution of zinc sulfate. 10 additional Ss served as saline controls. After

induction of peripheral anosmia, Ss showed marked reduction in the rate of ventral rubbing, indicating that similar findings previously obtained after bilateral removal of the olfactory bulbs were due to deprivation of olfactory input and not some more general concomitant of a central nervous system lesion.—*Journal abstract.*

2723. **Watson, Flora M.; Henry, James P. & Halmeyer, Gary C.** (U Southern California, Medical School) **Effects of early experience on emotional and social reactivity in CBA mice.** *Physiology & Behavior*, 1974(Jul), Vol 13(1), 9-14.—CBA agouti mice were handled and others were not in conjunction with their being reared in groups or isolation until adulthood. Emotional reactivity was assessed at 120 days of age by their activity in the open field, followed by measurement of plasma corticosterone levels, and social interaction was observed during their 15 wks in a Reimer-Petrus population cage. Handling and socialization produced a significant increase in open field activity, with the handled-socialized Ss being the most active. Isolated Ss had significantly higher plasma corticosterone levels than socialized Ss, but the difference between handled and nonhandled males was not significant. The handled-socialized Ss developed the most stable social hierarchy in the population cage, successfully differentiated roles, and had the lowest increase in systolic blood pressure. Isolated males failed to develop normal social behavior, and severe fighting was observed throughout the 15 wks; moreover, these Ss had a higher elevation of systolic blood pressure than the socialized Ss. (23 ref)—*Journal abstract.*

### Learning & Motivation

2724. **Syme, G. J.; Pollard, J. S.; Syme, Lesley A. & Reid, Robyn M.** (Ruakura Animal Research Station, Hamilton, New Zealand) **An analysis of the limited access measure of social dominance in rats.** *Animal Behaviour*, 1974(May), Vol 22(2), 486-500.—Notes that the limited access situation in which only 1 of 2 or more Ss can gain access to a reward during a restricted time-period is an accepted measure of dominance in the rat. The present 3 experiments with a total of 14 male hooded rats attempted to validate the technique by establishing the relationship between individual and competitive performance in order to determine whether priority of access had been measured. The generality of the competitive orders was examined by altering the competitive response while retaining the same reward. In view of the data collected for both time and weight-gain measures in food and water competition, it is doubtful whether the limited access competitive technique can be considered a valid measure of dominance for the laboratory rat. (31 ref)—*Journal abstract.*

2725. **Ayres, John J.; Benedict, James O.; Glackenmeyer, Richard & Matthews, William.** (U Massachusetts, Amherst) **Some factors involved in the comparison of response systems: Acquisition, extinction, and transfer of head-poke and lever-press Sidman avoidance.** *Journal of the Experimental Analysis of Behavior*, 1974(Sep), Vol 22(2), 371-379.—Head poking, a suggested natural escape reaction to shock for the rat, was compared to lever-pressing in a Sidman avoidance study. 3 experiments were conducted with a total of 32 naive

male Holtzman albino rats. Both responses could be emitted at any time, but only one was effective in a given session. Acquisition and extinction of the 2 responses were compared under both signaled and unsignaled avoidance. Then, a test for transfer was conducted in which acquisition conditions were reinstated, but the effectiveness of the responses was reversed. 3 differences between responses were noted: (a) head poking was superior in reducing shock rates under signaled conditions; (b) head poking was more resistant to extinction, especially under signaled conditions; and (c) under unsignaled conditions, Ss were unable to learn to head poke if they had previously learned to leverpress. Findings (a) and (c) were pursued in later experiments. Finding (a) depended on the location of the warning signal with respect to the response system. When the leverpress required approach to the warning signal, the head poke was superior. But when the head poke required approach to the warning signal, the 2 responses were equally effective. (18 ref)—*Journal abstract.*

2726. **Barrera, F. J.** (U North Carolina, Chapel Hill) **Centrifugal selection of signal-directed pecking.** *Journal of the Experimental Analysis of Behavior*, 1974(Sep), Vol 22(2), 341-355.—In 2 experiments a total of 12 male White Carneaux pigeons were exposed to a schedule of stimulus-correlated food presentations. When key pecks terminated trial signals and cancelled the delivery of food, pecking was either gradually or rapidly redirected away from the keys, depending on whether the food-omission contingency was introduced from the outset or after exposure to a response-independent baseline. In all cases, the food-omission contingency substantially reduced or eliminated pecking at the keys. (36 ref)—*Journal abstract.*

2727. **Bissell, Howard S. & Scavio, Michael J.** (California State U, Fullerton) **A minicomputer program for the resolution of response frequency and latency in classical conditioning preparations.** *Behavior Research Methods & Instrumentation*, 1974(Jul), Vol 6(4), 439-442.—Describes a classical conditioning program capable of controlling stimulus events and recording response data in experiments using the rabbit's nictitating membrane and/or jaw-movement responses. The system's extreme accuracy in latency measurement cannot be duplicated either by conventional hand-scoring methods involving oscillographic records or by other minicomputer conditioning programs.

2728. **Brush, Michael E. & Schaeffer, Robert W.** (Auburn U) **Effects of water deprivation on schedule-induced polydipsia.** *Bulletin of the Psychonomic Society*, 1974(Aug), Vol 4(2-A), 69-72.—12 food-deprived male Sprague-Dawley albino rats, randomly assigned to 3 equal groups, were successively exposed to (a) baseline conditions with water freely available in both the experimental chamber and the home cage and (b) baseline and free-reinforcement schedule (FFI-60-sec) conditions with water freely available in the experimental chamber and available on a free or limited basis in the home cage. Prior to experimental sessions, Group 1 had continuous access to water in the home cage, whereas Groups 2 and 3 were 12- and 22-hrs water deprived, respectively. Results indicate that water deprivation increased the probability of the development of

schedule-induced polydipsia but had no augmentative effect on either asymptotic intake level or rate of development of the phenomenon.—*Journal abstract.*

2729. Chantrey, David F. (U Keele, England) **Stimulus preexposure and discrimination learning by domestic chicks: Effect of varying interstimulus time.** *Journal of Comparative & Physiological Psychology*, 1974(Sep), Vol 87(3), 517-525.—Conducted a series of experiments with a total of 199 Ross strain chicks in which groups of Ss were preexposed to moving objects on Days 1-5 after hatching. Only 1 object was visible at a time, and the time between the appearance of one stimulus and the immediately succeeding appearance of the other was called the "interonset time." Ss which had been preexposed to both discriminanda in rapid alternation (interonset time of 1/4 min) learned a subsequent discrimination task more slowly than Ss familiar with neither stimulus; Ss preexposed to both discriminanda at separate times (interonset time of 30 min) learned the discrimination faster than Ss familiar with neither stimulus. The evidence suggests that the proportions of slow-learning and fast-learning Ss in a group were changed by varying interonset time. (25 ref)—*Journal abstract.*

2730. Christensen, Carol M.; Caldwell, Donald F. & Oberleas, Donald. (Wayne State U) **Establishment of a learned preference for a zinc-containing solution by zinc-deficient rats.** *Journal of Comparative & Physiological Psychology*, 1974(Sep), Vol 87(3), 415-421.—24 zinc-deficient, male Holtzman albino rats were trained to associate a novel-tasting solution with the partial amelioration of their deficiency. For 4 days, Ss were permitted to drink only a distasteful acetic acid solution containing a small quantity of zinc. When later offered a choice between a solution associated with the deficiency (distilled water) and an acetic acid solution, the Ss strongly preferred the latter. This contrasted sharply with choices of zinc-deficient Ss which had no previous experience with the acid-zinc solution. This group showed a strong aversion to the taste of the acid. Results also show (a) a positive correlation between weight gain during the 4-day education period and preferences for the acid-zinc solution, (b) a unique dietary sampling pattern among deficient Ss with prior exposure to zinc, and (c) a strong resistance to extinction of consumption of the novel acidic solution when zinc had been deleted.—*Journal abstract.*

2731. Cohen, David H. (U Virginia, Medical School) **Effect of conditioned stimulus intensity on visually conditioned heart rate change in the pigeon: A sensitization mechanism.** *Journal of Comparative & Physiological Psychology*, 1974(Sep), Vol 87(3), 495-499.—In visually conditioned heart-rate change in 30 White Carneaux pigeons, increasing the conditioned stimulus intensity enhanced performance. The effect, which only appeared at high intensity levels, was obtained during acquisition and with rigorous maintenance of constant stimulus conditions. A similar effect was obtained with 10 sensitization control Ss. Evidence is presented that the stimulus intensity effect during conditioning may have totally reflected increased sensitization such that the locus of the effect was upon performance rather than conditioning per se. (18 ref)—*Journal abstract.*

2732. Cohen, Perrin S. & Looney, Thomas A. (Northeastern U) **Mirror control of responding on fixed-ratio schedules in pigeons.** *Bulletin of the Psychonomic Society*, 1974(Aug), Vol 4(2-B), 113-115.—Reports that one of 3 White Carneaux pigeons exposed to multiple fixed ratio-fixed ratio (FR-FR) reinforcement schedules attacked a mirror target during postreinforcement pauses preceding the higher FR schedule. The same mirror-image stimulation, on the other hand, reduced reinforcement rate for all 3 pigeons by selectively increasing postreinforcement pauses preceding the higher FR schedule. This indicates that in studies of reinforcement schedules with pigeons, mirror-image stimulation from surfaces commonly present in standard test chambers (e.g., one-way mirrors, metal walls) may interact with schedule parameters to control postreinforcement behavior other than attack.—*Journal abstract.*

2733. Davis, Hank & Burton, Jo-Ann. (U Guelph, Ontario, Canada) **The measurement of response force during a lever-press shock-escape procedure in rats.** *Journal of the Experimental Analysis of Behavior*, 1974(Sep), Vol 22(2), 433-440.—Gave 3 naive male Wistar albino rats extensive exposure to an escape procedure in which shocks were scheduled to occur 30 sec apart. The amount of downward force exerted on the lever was continuously recorded and compared with traditional discrete measurement in which only responses above an arbitrary force threshold were recorded. Ss typically remained in contact with the lever throughout the shock-free intertrial interval. Shock onset reliably occasioned a brief lurch from and return to the lever, which resulted in a leverpress escape response being recorded. Lever contact, which occupied an average of 90% of session time, showed great stability in force after a brief period of instability after each shock terminated. In general, continuous measurement revealed considerably different results than discrete measurements of on-lever behavior. For example, continuous lever contact fluctuating near response threshold was often recorded as discrete responding, and sustained lever contact occurring below response threshold was omitted from discrete measurement.—*Journal abstract.*

2734. Davis, Michael. (Yale U, Medical School) **Sensitization of the rat startle response by noise.** *Journal of Comparative & Physiological Psychology*, 1974(Sep), Vol 87(3), 571-581.—In a series of 6 experiments with a total of 160 male Sprague-Dawley albino rats, it was found that the startle response showed a progressive increase in amplitude when tones were presented against a high level of background noise. This sensitization effect was not a result of repetitive exposure to tones but rather a result of continuous exposure to noise. The size of the effect was directly related to noise intensity and required about 30-45 min to reach a maximum. The effect did not dissipate when the noise was maintained but did dissipate once the noise was turned down. Results are discussed in terms of the experimental conditions under which repetitive stimulus exposure produces either sensitization or habituation of the startle reflex.—*Journal abstract.*

2735. DeCasper, Anthony J. & Zeiler, Michael D. (Emory U) **Time limits for completing fixed ratios: III. Stimulus variables.** *Journal of the Experimental Analysis*

of *Behavior*, 1974(Sep), Vol 22(2), 285-300.—White Carneaux pigeons received food only if they took longer than a specified time to begin and complete a fixed ratio. In Exp I with 4 Ss, ratios with shorter durations had no stimulus consequence: in Exp II with 4 additional Ss, these ratios ended with a stimulus change. In both studies, the mean time to complete the ratio exceeded requirements of less than 30 sec, approximately matched requirements of 30 sec, and fell progressively short of matching thereafter. The various effects resembled those of temporal differentiation experiments involving single responses. Although both number of ratios and time separating successive food presentations increased along with ratio duration, control experiments showed that differential reinforcement of duration, rather than either form or reinforcer intermittency, accounted for the performance. Exp II also studied the effects of adding a stimulus that signaled when the required time had elapsed. The stimulus produced durations that matched even the most stringent requirements. This precision was not maintained when the stimulus was removed. Temporal differentiation schedules seem to have similar effects regardless of the response class and temporal property involved. (21 ref)—*Journal abstract*.

2736. Delprato, Dennis J. & Meltzer, Richard J. (Eastern Michigan U) **Type of start box and goal box distinctiveness in self-punitive running of rats.** *Journal of Comparative & Physiological Psychology*, 1974(Sep), Vol 87(3), 548-554.—A total of 96 male Sprague-Dawley rats were first trained to escape shock in an alley by running to a safe goal box. In Exp I either a trapdoor-floored start box or a guillotine-door start box was used in different groups. In extinction, nonpunished and punished subgroups were tested in each of the start-box conditions. Punishment produced faster running speeds than nonpunishment (self-punitive effect) only with the trapdoor. The trapdoor start box was used in Exp II, and independent groups of Ss were trained to escape to a goal box that was either very dissimilar or similar to the shock area. Nonpunished and punished subgroups were extinguished in each goal box condition. Self-punitive running was more likely with the dissimilar goal box.—*Journal abstract*.

2737. Dutch, J. (Victoria U, Wellington, New Zealand) **Comparison of the reinforcing properties of conditioned and discriminative stimuli in new and previously experienced environments.** *Bulletin of the Psychonomic Society*, 1974(Aug), Vol 4(2-A), 85-86.—Drinking in 64 male Sprague-Dawley rats was either preceded or accompanied by a tone. When barpressing was subsequently conditioned to the tone, it was found that more barpresses were made in a totally new environment than in the environment in which conditioning of the tone had taken place. Within each environment, there was no difference in the effectiveness of the tone stimuli.—*Journal abstract*.

2738. Farthing, G. William. (U Maine, Orono) **Behavioral contrast with multiple positive and negative stimuli on a continuum.** *Journal of the Experimental Analysis of Behavior*, 1974(Sep), Vol 22(2), 419-425.—After an initial period of nondifferential training, 6 female Silver King pigeons were trained on a go-no-go discrimination involving 12 line tilts from vertical

clockwise to horizontal. Responses to the 1st 6 tilts (positive stimuli) were reinforced on a variable-interval 1-min schedule, whereas responses to the other 6 tilts (negative stimuli) were extinguished. During the 1st several discrimination sessions, the highest response rate was typically to one of the positive stimuli that was relatively close to the negative stimuli or at an intermediate distance, rather than to one of the positive stimuli most distant from the negative stimuli. This effect decreased with extended training up to 50 or 80 sessions.—*Journal abstract*.

2739. Force, Donald D. & LoLordo, Vincent M. (Dalhousie U, Halifax, Nova Scotia, Canada) **Transfer of control of the pigeon's key peck from food reinforcement to avoidance of shock.** *Journal of the Experimental Analysis of Behavior*, 1974(Sep), Vol 22(2), 251-259.—Initially trained 8 male White Carneaux pigeons to peck a white key for food under a variable-interval 1-min schedule of reinforcement. Then, a shock-avoidance schedule was initiated, and food was no longer available in the experimental situation. Under the avoidance schedule, each peck on the key postponed shock for 40 sec. A warning signal, consisting of tone and red houselights, was presented after 30 sec without a response. If no response occurred, a shock was delivered 10 sec after warning-signal onset. Shocks were delivered every 10 sec in the presence of the warning signal until a response was made. The warning signal was terminated only by a response. Keypecking of all 8 Ss came under control of the avoidance schedule, and responding continued throughout the 20-day avoidance training period. (34 ref)—*Journal abstract*.

2740. Giulian, Dana; Snowdon, Charles T. & Krom, Larry S. (Rockefeller U, New York, NY) **A completely automated closed-field maze series for rats.** *Physiology & Behavior*, 1974(Jul), Vol 13(1), 183-187.—Describes a device for rats in which movements across a maze field of insulated floor plates are monitored by a transistor amplifying-detection circuit. Complete automation eliminates observer involvement and provides a reliable and inexpensive means for testing large numbers of animals. Further modification of the system permits analysis of the direction in animal movements.

2741. Griffin, Patrick; Honaker, L. Michael; Jones, Daniel E. & Pynes, Leonard T. (U Alabama) **Preference for signaled vs unsignaled shock in pigeons with implanted electrodes.** *Bulletin of the Psychonomic Society*, 1974(Aug), Vol 4(2-B), 141-143.—In an experiment with 2 adult male Silver King pigeons, treadle presses produced changeover from a program of unsignaled, unavoidable, and inescapable shock to a program in which shock was preceded by a 5-sec visual and auditory preshock signal. Different houselight colors were correlated with the 2 programs. Both Ss, albeit marginal in 1 S, spent more session time in the signaled shock program when the above conditions prevailed than if (a) only the stimulus correlated with the signaled shock program (but not the preshock signal) occurred or (b) neither preshock signal nor correlated stimulus occurred.—*Journal abstract*.

2742. Grott, Robert & Neuringer, Allen. (Reed Coll) **Group behavior of rats under schedules of reinforcement.** *Journal of the Experimental Analysis of Behavior*,

1974(Sep), Vol 22(2), 311-321.—Conducted 4 experiments with a total of 24 Long-Evans and 12 Fisher naive female rats. Groups of 3 Ss were placed in a chamber containing 1 response lever and 1 water dispenser. A variety of schedule conditions were explored including fixed ratio, extinction, satiation, fixed interval, fixed time, differential reinforcement of low rates, and discrimination learning. Each group was treated as a single unit, with the collective lever responses emitted by the 3 Ss being the main dependent variable. Group responding was controlled by the reinforcement schedules in an orderly and consistent manner. However, the groups often paused less and responded faster than individual Ss working under identical conditions. (22 ref)—*Journal abstract*.

2743. Hall, Geoffrey. (U Sussex, Lab of Experimental Psychology, Brighton, England) **Strategies of simultaneous discrimination learning in the pigeon.** *Quarterly Journal of Experimental Psychology*, 1974(Aug), Vol 26(3), 520-529.—Trained 16 White Carneaux pigeons in Exp I on a simultaneous discrimination between red and orange. After they had mastered the problem they were presented on occasional test trials with 2 red or with 2 orange stimuli. On those test trials when both stimuli were positives (S+) the Ss tended to peck always to 1 key. On trials with 2 negative stimuli (S-) the Ss chose the other key. Results suggest that the Ss used the presence of the S- on their preferred side as a cue for pecking to the other side. Exp II investigated the role of the S+ with 16 additional Ss. Transfer tests involving the introduction of a neutral stimulus suggested that Ss varied in the extent to which they relied upon the S+. Some Ss showed no preference for the S+ over the neutral stimulus. However, when required to learn a discrimination between the old S+ and the neutral stimulus, Ss given the old S+ as the positive learned more rapidly than those given the neutral stimulus as the positive.—*Journal abstract*.

2744. Hara, Masataka. (Tokyo U of Education, Japan) **[Imprinting in chicks: Effects of first exposure and movement confinement.]** (Jpn) *Annual of Animal Psychology*, 1972, Vol 22(2), 51-60.—Studied the effect of the "following response" on imprinting. 40 White Leghorn chicks 14-20 hrs old were individually exposed to a 15-cm red cube continuously moving at a speed of 13 cm/sec in a runway. When tested 48 hrs later, the Ss that were allowed to move freely during the 1st exposure to the cube followed the cube after the shortest latency, for the longest period of time, and most frequently. The Ss confined in a glass container during the 1st exposure did not show any more following responses than the unexposed Ss. Results support the law of effort. (English summary) (16 ref)—*S. Nakajima*.

2745. Hughes, Larry F.; Dunlap, William P. & Dachowski, Lawrence. (Louisiana State U, Medical Ctr, Kresge Hearing Research Lab of the South) **Reward magnitude and partial reinforcement effects in a single runway.** *Journal of Comparative & Physiological Psychology*, 1974(Sep), Vol 87(3), 563-570.—The partial reinforcement acquisition effect (PRAE) in running speeds and the frustration effect (activity following nonreward compared with reward) were measured simultaneously in an alley whose goal-box floor was a stabilimeter.

Experimental groups of 9 male Charles River albino rats each received 50 or 100% reinforcement combined factorially with 3 magnitudes of reward (1, 3, or 9 pellets). A control group of 18 Ss was never rewarded. The size of the PRAE was a direct function of reward magnitude, and crossing of 50 and 100% curves was found for all alley segments, including the goal segment. The frustration effect (FE) was present by the 2nd day of training for the 3- and 9-pellet groups, and the size of the FE was directly related to reward magnitude. The present study is unique in that (a) the findings were free from the effects of reward contrast, (b) behavior antecedent to the goal indicated that incentive was effectively manipulated, and (c) an unrewarded control group was used. (31 ref)—*Journal abstract*.

2746. Hunsicker, James P. & Reid, Larry D. (Bradley U) **"Priming effect" in conventionally reinforced rats.** *Journal of Comparative & Physiological Psychology*, 1974(Oct), Vol 87(4), 618-621.—Ran 15 male albino rats in alleys for water reinforcement with intertrial intervals (ITIs) similar to the intervals typically used in studies of intracranial reinforcement. When deprived over 15 hrs Ss ran faster with very short ITIs (7 sec) than with longer ITIs (95 sec). Comparisons with rats described in other studies running for intracranial reinforcement leads to the conclusion that, regardless of what kind of reinforcer is used, rats run faster for a reinforcer when ITIs are only seconds long rather than over a minute. (17 ref)—*Journal abstract*.

2747. Kamin, Leon J. & Galoni, Stephen J. (Princeton U) **Compound conditioned emotional response conditioning with differentially salient elements in rats.** *Journal of Comparative & Physiological Psychology*, 1974(Sep), Vol 87(3), 591-597.—R. Rescorla and A. R. Wagner's model of conditioning (1972) implies that, if 2 conditioned-stimulus (CS) elements are independently conditioned to asymptote and then compounded, reinforcement of the compound should reduce the conditioned strength of each element. Further, the more salient element should lose more strength and should ultimately show less conditioned strength than the less salient element. 4 groups of 8 male Holtzman albino rats each, in a conditioned emotional response procedure, provided 2 independent tests of this deduction at different levels of CS salience. Data in each case appear consistent with the model's prediction, significantly so in 1 case. Data in other aspects confirm deductions drawn from the model.—*Journal abstract*.

2748. King, Glen D.; Schaeffer, Robert W. & Pierson, Stephen C. (Auburn U) **Reinforcement schedule preference of a raccoon (*Procyon lotor*).** *Bulletin of the Psychonomic Society*, 1974(Aug), Vol 4(2-A), 97-99.—Gave a male raccoon a choice to respond for food pellets on either a fixed interval (FI) 30-sec schedule or a fixed ration (FR) schedule, the response requirement of which was systematically varied. S preferred the FR schedule only when the rate of reinforcement on the FR schedule exceeded the rate of reinforcement on the FI schedule by a factor of 2. The highly efficient responding of the S on the FI schedule was noted as encouragement for using this species more frequently in operant learning paradigms.—*Journal abstract*.

2749. Kruger, Brian M. (Wright State U) **Self-punitive running in the rat following start box fear conditioning: Shock intensity effects.** *Journal of Comparative & Physiological Psychology*, 1974(Sep), Vol 87(3), 555-562. —In Phase 1 of an experiment with 240 female hooded rats, buzzer-alone presentations or buzzer-shock pairings were given in the start box of a 4-ft straight alley. Phase 2 consisted of runway test trials during which there was no shock in the alley or there was shock in the last 2 ft. Shock levels employed in each phase were 0, 40, 53, and 70 v. All Phase 1 nonshock Ss ceased running by Trial 3. In general, for Ss shocked in Phase 1, running speed and the number of Ss completing all 60 trials were greater for shocked than nonshocked Phase 2 conditions. In addition, the stronger the Phase 1 shock, the greater the number completing all trials and the faster the speeds. Phase 2 shock intensity was not a significant factor. (15 ref)—*Journal abstract*.

2750. Kuch, Dennis O. (McMaster U, Hamilton, Ontario, Canada) **Differentiation of press durations with upper and lower limits on reinforced values.** *Journal of the Experimental Analysis of Behavior*, 1974(Sep), Vol 22(2), 275-283. —12 naive male albino rats received food following leverpress durations between  $t$  and  $t + t'$  sec where  $t$  was 2, 4, or 8 sec and  $t'$  was 25t, .50t, or 1.00t sec. Modal press durations were greater than  $t$  but less than  $t + t'$  in all cases. Distributions of press durations were lower and broader for larger values of  $t$ . Lower  $t' / t$  ratios produced lower median press durations and relatively narrower press-duration distributions. Median press duration was a power function of  $t$  within a  $t' / t$  ratio condition, corresponding to previous results for latency, interresponse time, and response durations. —*Journal abstract*.

2751. Lattal, Kennon A. (West Virginia U) **Combinations of response-reinforcer dependence and independence.** *Journal of the Experimental Analysis of Behavior*, 1974(Sep), Vol 22(2), 357-362. —Investigated the contribution of the response-reinforcer dependency to the control of behavior. 4 experienced White Carneaux pigeons were trained to keypeck under a variable-interval schedule of reinforcement. With the total number and temporal distribution of reinforcer deliveries in experimental sessions constant, the effects of varying the percentage of response-independent reinforcement were examined. At different times, 100, 66, 33, 10, or 0% of the scheduled reinforcers were delivered dependent upon keypecking, and the remainder were delivered independently of responding. Response rates were related to the percentage of response-dependent reinforcement, with lower response rates associated with smaller percentages of response-dependent reinforcement. Results suggest that the response-reinforcer relation exerts control over behavior in a manner similar to that exerted by other parameters of reinforcement. —*Journal abstract*.

2752. Leftwich, Debra & May, James G. (Child Study Ctr, New Orleans, LA) **Effects of conditioned aversive stimuli presented during tonic immobility in guinea pigs.** *Journal of Comparative & Physiological Psychology*, 1974(Sep), Vol 87(3), 513-516. —The duration of and susceptibility to tonic immobility were measured in 3 groups of albino and pigmented guinea pigs ( $N = 27$ )

while a train of intense tone bursts was presented. In 1 group, the tone bursts had been previously associated with painful shock stimuli. The 2nd group had previously experienced the tone bursts alone, and the 3rd group had previously received shocks without the train of tone bursts. Results indicate that both groups which had previously received shock exhibited increased susceptibility to immobilization, and the no-shock group showed a decline in duration when tone bursts were presented. Results could not be easily interpreted to support the fear hypothesis. Explanations involving "sensitization" and "learned helplessness" are proposed. —*Journal abstract*.

2753. Li, Mei-Chih. (National Cheng-Chi U, Taipei, Taiwan, Republic of China) **The effect of spontaneous recovery and interference on rats' retention of discriminations.** *Acta Psychologica Taiwanica*, 1973, Vol 15, 41-45. —Trained 36 albino male rats successively to learn 2 discriminative problems to the same learning criterion. The problems were comparable to the A-B, A-D paradigm in verbal learning. Retention of either discrimination was tested in 8 sessions over a 2-day interval. Results confirm interference theory and the crowding effect. Proactive inhibition increased with time while retroactive inhibition decreased, then both became approximately equal. —*Journal abstract*.

2754. Long, Carolyn K. & Allen, Joseph D. (U Georgia) **Stimulus compounding in pigeons.** *Bulletin of the Psychonomic Society*, 1974(Aug), Vol 4(2-A), 95-97. —Trained 2 male White King pigeons on a 3-ply multiple schedule in which reinforcement was available on a variable interval 1-min schedule for 2 of the components and extinction was in effect for the 3rd component. Ss associated with reinforcement were either a tone or a light and the S-delta associated with the extinction component was the absence of tone and light. After response rates stabilized, testing for summation was conducted with both steady-state and extinction test procedures. Both of these procedures involved 1-min presentations of the compound tone and light. Results indicate that summation did not emerge under the steady-state test conditions but did emerge under extinction test conditions. —*Journal abstract*.

2755. Lydersen, Tore & Cheney, Carl D. (Utah State U) **Fixed-ratio discrimination effects of extinction and satiation.** *Journal of Biological Psychology*, 1973(Dec), Vol 15(2), 26-29. —Trained 3 White King pigeons under conditional discrimination procedures in which fixed-ratio (FR) 30 and FR 60 were randomly scheduled on the center of 3 response keys. Reinforcement was contingent upon a left-side key response on FR-30 trials and upon a right-side key response on FR-60 trials. Following stable performance, the behavior was placed under either extinction or Ss were allowed to continue responding until satiated. Results show that under both procedures responding subsequently ceased, but no systematic effects were found upon the accuracy of the discrimination. The absence of an effort upon accuracy by extinction and satiation in the present task is consistent with results of prior conditional discrimination research in which exteroceptive stimuli were used. —*Journal abstract*.

2756. Marcucella, Henry. (Boston U) **Signalled reinforcement in differential-reinforcement-of-low-rate schedules.** *Journal of the Experimental Analysis of Behavior*, 1974(Sep), Vol 22(2), 381-390.—At several fixed and variable minimum reinforced interresponse times (IRTs), a stimulus was added to differential-reinforcement-of-low-rate (DRL) schedules to signal the availability or nonavailability of reinforcement to 30 male Sprague-Dawley albino rats. As the minimum reinforced IRT increased, the rate of unreinforced responding decreased. Changing from fixed to variable minimum IRT in the basic DRL schedule further decreased the rate of unreinforced responding. Both effects were to some degree reversible. For fixed minimum reinforced IRTs of 30 sec or shorter, most unreinforced responses terminated IRTs just short of that required for reinforcement. The minimum reinforced IRT and the number of short response latencies to the onset of the signal were negatively correlated. Both of these analyses suggested that at values of 30 sec or shorter, Ss discriminated the availability of the reinforcer more on the basis of time than on the basis of presence or absence of the signal. (21 ref)—*Journal abstract.*

2757. Matthews, T. James; McHugh, Thomas G. & Carr, Lucille D. (New York U) **Pavlovian and instrumental determinants of response suppression in the pigeon.** *Journal of Comparative & Physiological Psychology*, 1974(Sep), Vol 87(3), 500-506.—Exp I demonstrated the formation of a discriminated punishment effect in the absence of a conditioned emotional response. Electric shocks were delivered at random intervals to 3 naive male White Carneaux pigeons pecking for food on a variable-interval schedule. During a 1-min visual conditioned stimulus (CS), scheduled shocks were delayed until a response occurred (punishment). Differential suppression to the CS was observed in addition to overall suppression. Suppression was related to shock intensity. In Exp II with the same Ss, CS suppression was related to the CS and was not an artifact of response pattern or discrimination of shock patterns. The punishment contingency without the CS did not suppress behavior, and the CS without the punishment contingency did not relieve suppression.—*Journal abstract.*

2758. McAllister, Wallace R.; McAllister, Dorothy E.; Weldin, Garry H. & Cohen, Jeffrey M. (Northern Illinois U) **Intertrial interval effects in classically conditioned fear to a discrete conditioned stimulus and to situational cues.** *Journal of Comparative & Physiological Psychology*, 1974(Sep), Vol 87(3), 582-590.—In Exp I fear was classically conditioned in a total of 240 female hooded and Sprague-Dawley rats with a discrete conditioned stimulus (CS) at intertrial intervals (ITIs) of 15, 45, 75, 105, 165, or 225 sec and in Exp II, with an additional 144 Ss, with or without a discrete CS at ITIs of 165, 225, or 285 sec. The amount of fear conditioned to situational cues and to the discrete CS plus situational cues was then measured by the learning of a hurdle-jumping response which allowed escape from the fear-eliciting stimuli. Results suggest that as ITI was lengthened fear conditioned to situational cues alone and to the discrete CS increased. However, following conditioning with a discrete CS, fear elicited by situational cues increased with ITI but then decreased, presumably because a

discrimination had been formed between the situational cues and the compound of CS plus situational cues.—*Journal abstract.*

2759. McMillan, John C. (Franklin D. Roosevelt VA Hosp, Montrose, NY) **Average uncertainty as a determinant of observing behavior.** *Journal of the Experimental Analysis of Behavior*, 1974(Sep), Vol 22(2), 401-408.—After discrimination training on a multiple variable-interval (VI) extinction schedule of food reinforcement, 6 male White Carneaux pigeons were placed on the uncued or mixed version of the same schedule. Ss were allowed to make an optional "observing response" that converted the uncued schedule to the corresponding cued schedule by providing a 20-sec exposure to the appropriate discriminative stimulus. The schedule consisted of 100 40-sec components, and the probability that any one of them would be a VI component was systematically varied between .00 and 1.00. Results show that the amount of observing behavior was an inverted-U function of the probability of the VI component. Few observing responses occurred at probabilities of .00 or 1.00, and maximum responding occurred at a value less than .50. (21 ref)—*Journal abstract.*

2760. Meisch, Richard A. & Thompson, Travis. (U Minnesota) **Rapid establishment of ethanol as a reinforcer for rats.** *Psychopharmacologia*, 1974, Vol 37(4), 311-321.—Daily 6-hr sessions were run during which each leverpress by 7 male Sprague-Dawley rats produced brief access to water, or to 8% ethanol on experimental days. Food pellets were presented noncontingently on a 1-min fixed-time schedule during the last 4 hrs of each session. A stable baseline of water responding developed, characterized by little or no responding during the 1st 2 hrs followed by high rates and schedule-induced polydipsic drinking during the last 4 hrs. Following the development of a stable water baseline, 8% ethanol was substituted for water on alternate days. Ss' responding for ethanol during the 1st 2 hrs of a session substantially exceed water baseline rates, indicating that ethanol had been established as a reinforcer. Subsequently, when food pellet presentations were discontinued, and the ethanol concentration was increased from 8 to 16 to 32%, ethanol intake persisted at values exceeding water control levels. Results confirm that ethanol was functioning as a reinforcer. (24 ref)—*Journal abstract.*

2761. Morgan, M. J. (U Cambridge, England) **Effects of random reinforcement sequences.** *Journal of the Experimental Analysis of Behavior*, 1974(Sep), Vol 22(2), 301-310.—Exposed 10 naive male hooded rats to a random sequence of reinforcement on 2 levers, such that there was no way to predict from the previous reinforcement which lever would deliver reinforcement next. The Ss showed a tendency to repeat the choice that had just produced reinforcement, despite the absence of an overall contingency that differentially reinforced such repetition. This tendency decreased with continued exposure to the schedule. Runs of successive reinforcements on a lever increased the probability of pressing that lever, but only slightly, and only in the earlier phases of training. The more quickly a press was made after reinforcement the more likely it was to be on the lever that had delivered that reinforcement. Repetition of a choice followed by reinforcement should be viewed as a

naturally occurring behavior in the rat, but not necessarily as a behavior that will continue without differential reinforcement of repetition.—*Journal abstract.*

2762. Morgan, M. J. (U Cambridge, Psychological Lab, England) **Resistance to satiation.** *Animal Behaviour*, 1974(May), Vol 22(2), 449-466.—Reviews the phenomenon of resistance to satiation, in which instrumental behavior continues in the absence of the consummatory response towards which it was originally directed. These findings illustrate, along with other data, that consummatory and instrumental activities are not determined by a single intervening drive variable. One account of the relationship between consummatory and instrumental activities is that instrumental responding is maintained by the reinforcing effects of consummatory activities and will only gradually disappear when that reinforcement is withdrawn. This suggests that satiation is highly related to extinction of behavior by nonreward, and evidence for this possibility is presented. (105 ref)—*Journal abstract.*

2763. Pencer, Edward L. (St Francis Xavier U, Antigonish, Nova Scotia, Canada) **Persistence in the absence of primary motivation in the albino rat.** *Journal of Comparative & Physiological Psychology*, 1974(Oct), Vol 87(4), 787-792.—Trained 24 male Holtzman rats under either partial reinforcement (PRF) or continuous reinforcement (CRF). Ss were subsequently pre-fed their daily ration in the form of reward pellets and immediately run in the same task under a CRF schedule. Results reveal that PRF-trained Ss persisted in the satiated state relative to CRF controls. These results, termed the satiation effect, present difficulties to theories of persistence which address only extinction tests. An interpretation utilizing a modification of A. Amsel's (1962) frustration hypothesis is advanced. Implications of this proposal for a general theory of persistence and the methodological advantages of the satiation technique are discussed.—*Journal abstract.*

2764. Pert, Agu & Gonzalez, R. C. (Biomedical Lab, Edgewood Arsenal, MD) **Behavior of the turtle (*Chrysemys picta picta*) in simultaneous, successive, and behavioral contrast situations.** *Journal of Comparative & Physiological Psychology*, 1974(Sep), Vol 87(3), 526-538.—4 experiments on reward and learning in a total of 99 painted turtles yielded the following patterns of results: negative simultaneous contrast, positive behavioral contrast, a positive relation between magnitude of reward and resistance to extinction, and a gradual decrement in performance as a function of abrupt reduction in magnitude of reward, but no suggestion of negative successive contrast. This pattern is the same as that of analogous experiments with fish and quite different from that of analogous experiments with rats. Its bearing on the interrelations among the various contrast phenomena and on the problem of phyletic differences in learning is discussed. (39 ref)—*Journal abstract.*

2765. Quirt, B. Michael & Cohen, Jerome S. (Oxford Regional Hosp Ctr, Woodstock, Ontario, Canada) **Effects of intermittent and constant punishment on resistance to punishment in a free operant situation for the albino rat.** *Journal of Comparative & Physiological Psychology*, 1974(Sep), Vol 87(3), 539-547.—Trained

male Wistar albino rats (10 experimental and 9 control Ss) to barpress for food reinforcement in a 2-bar cyclic response chain situation. Responding on 1 bar led also to a punishment (footshock) on either an intermittent or constant schedule. Both punishment schedules led to increased responding on the nonpunished bar and to initial response suppression followed by recovery on the punished bar. For Ss on the intermittent schedule, the response increase on the nonpunished bar was seen only after a punishment on the other bar. Similar effects were found for transfer time between the 2 bars. The effects of punishment on response to both bars were more pronounced for the intermittent punishment groups. Results are discussed in terms of the motivational constructs of A. Amsel and of R. K. Banks.—*Journal abstract.*

2766. Robinson, Paul W. & Shelley, Monte F. (Brigham Young U) **The effects of total darkness on schedule control.** *Journal of the Experimental Analysis of Behavior*, 1974(Sep), Vol 22(2), 391-400.—Investigated the effect of total darkness on the keypecking of 8 naive male homing pigeons under fixed-ratio, variable-ratio, fixed-interval, and variable-interval schedules of food reinforcement. Ss were divided into groups of 2, with each group conditioned to peck under 1 of the 4 schedules of reinforcement. Under an ABAB procedure, all Ss experienced alternating light and dark conditions. The house- and keylights were (a) maintained at full intensity for the 1st 30 1-hr sessions, (b) faded out and disconnected over Sessions 31 through 50, (c) totally illuminated for Sessions 51 to 60, and (d) disconnected again for the final 10 sessions. Responding under the ratio schedules increased from 20 to 108% in the dark, and responding under the interval schedules in the dark decreased by 37 to 93%. (21 ref)—*Journal abstract.*

2767. Shipley, Robert H. (U Missouri, Medical School) **Extinction of conditioned fear in rats as a function of several parameters of CS exposure.** *Journal of Comparative & Physiological Psychology*, 1974(Oct), Vol 87(4), 699-707.—Employed Pavlovian fear acquisition and extinction procedures in a factorial design which varied conditioned-stimulus (CS) duration in acquisition, the number and duration of CS exposures in extinction, and total CS exposure across extinction trials. Ss were 128 female Blue Spruce hooded rats. Suppression of licking for water served as the measure of residual fear. The data revealed that suppression of licking was an inverse function of total nonreinforced CS exposure irrespective of the number and duration of extinction exposures used to amass that total. The effect of total nonreinforced CS exposure was not significantly influenced by the duration of the CS utilized in acquisition training. The discrepancy between the obtained results and predictions derived from several theories of extinction is discussed. (22 ref)—*Journal abstract.*

2768. Siegel, Shepard & Domjan, Michael. (McMaster U, Hamilton, Ontario, Canada) **The inhibitory effect of backward conditioning as a function of the number of backward pairings.** *Bulletin of the Psychonomic Society*, 1974(Aug), Vol 4(2-B), 122-124.—Independent groups of a total of 39 male albino rats received classical conditioning acquisition following 0, 5, 10, 25, or 50 preexposures to the conditioning stimuli in a backward-

paired manner (the unconditioned stimulus preceding the conditioned stimulus). In both the conditioned suppression situation with rats an eyelid conditioning situation with 59 male New Zealand rabbits, backward preexposure retarded acquisition (in agreement with earlier findings). Furthermore, increasing backward-paired experience with the conditioning stimuli was associated with increasingly deleterious effects on acquisition performance. Results are contrary to suggestions that backward-conditioning-induced retardation of subsequent acquisition results only from extensive backward preexposures, with fewer such preexposures producing excitatory effects.—*Journal abstract.*

2769. Sinclair, J. D. (State Alcohol Monopoly, Research Lab, Helsinki, Finland) **Rats learning to work for alcohol.** *Nature*, 1974(Jun), Vol 249(5457), 590-592.

—6 male albino rats from 3 strains (AA, Sprague-Dawley, and ANA) who exhibited consistent high preferences for alcohol over water and standard rat food were tested in an operant conditioning and reversal experiment in a 2-bar Skinner box. All 6 Ss met the criterion for learning to work for alcohol within the 1st 3 nights. A reversal test was then designed by switching the alcohol and water bars; all but 1 S learned the reversal. Motivation for alcohol was studied in an AA rat and a Sprague-Dawley rat which had learned to work for alcohol by adding weights progressively to the response bars. Both rats pressed the alcohol bar until over 140 g were attached, although responding by the Sprague-Dawley rat decreased as a linear function of the weight added. Because food and water were freely available and no shaping was used, results cannot be attributed to motivation from hunger or thirst or to shaping procedures; it appears that learning was reinforced by obtaining alcohol *per se* to drink. (15 ref)—*L. Gorsey.*

2770. Slotnick, Burton M. & Katz, Howard M. (NIMH, Bethesda, MD) **Olfactory learning-set formation in rats.** *Science*, 1974(Aug), Vol 185(4153), 796-798.

—In 2 experiments, 12 rats trained on 16 2-odor discrimination problems showed rapid acquisition of a learning set and 1-trial learning by the end of the problem series. Learning to sample odor cues before responding and adoption of a "win-stay, lose-shift" strategy probably accounts for the virtually errorless learning. It is concluded that learning-set performance of rats trained with odor stimuli is comparable to that reported for primates trained on visual cues.—*Journal abstract.*

2771. Staddon, J. E. (Duke U) **Temporal control, attention, and memory.** *Psychological Review*, 1974(Sep), Vol 81(5), 375-391.—Notes that animals do not usually respond for food at times when it is not available (e.g., the time just after food delivery on periodic schedules). Consequently, food acquires inhibitory aftereffects (inhibitory temporal control) on such schedules so that its omission elevates subsequent response rate (omission effect). Previous data, results of an experiment with 4 male White Carneaux pigeons, and arguments are presented to show that temporal control depends on the properties of memory and attention. Maintained reinforcement-omission effects reflect temporal overshadowing of neutral events (e.g., food omission) by more salient and memorable events (e.g., food). Disinhibition of delay

and reinforcement-magnitude context effects can also be analyzed in these terms. (65 ref)—*Journal abstract.*

2772. Stahl, Jeanne M. & Ellen, Paul. (Georgia State U) **Factors in the reasoning performance of the rat.** *Journal of Comparative & Physiological Psychology*, 1974(Sep), Vol 87(3), 598-604.—4 experiments, investigating the performance of a total of 25 male Long-Evans hooded rats on the Maier 3-table reasoning task, demonstrated that the reasoning solution did not depend on either stimuli associated with the apparatus (olfactory and tactile) or internal spatial orientation cues (vestibular) to the locus of the food. The exploratory experience was critical for performance, and it is suggested that the reasoning solution involved the integration of separate past experiences rather than merely being a response to some specific cue in the situation.—*Journal abstract.*

2773. Strouthes, Andrew; Volo, Alfred M. & Unger, Thomas. (State U New York, Binghamton) **Hunger, thirst and their interactive effects on the rat's drinking in a saccharin-water choice.** *Physiology & Behavior*, 1974(Jul), Vol 13(1), 153-157.—Conducted an experiment and 2 replications of it with a total of 222 Sprague-Dawley albino rats. Ss preferred water to 1.0% saccharin and drank large volumes of it, provided that hours of water deprivation (thirst) exceeded hours of food deprivation (hunger). All others (i.e., undeprived, equally hungry and thirsty Ss, and those whose hunger exceeded thirst) preferred 1.0% saccharin but drank small amounts relative to the amounts of water drunk by the thirsty Ss. Results suggest that thirsty Ss drank saccharin primarily for water, and to a lesser extent and only with experience for the sensory stimulation which saccharin provided. Hungry Ss drank it primarily for the sensory stimulation. Saccharin in a choice with water seems to provide a means for the determination of the momentarily dominant drive state in naive rats. (15 ref) *Journal abstract.*

2774. Thomas, G. V. & Cameron, G. N. (U Stirling, Scotland) **Response rate, reinforcement frequency, and behavioral contrast.** *Journal of the Experimental Analysis of Behavior*, 1974(Sep), Vol 22(2), 427-432.—3 experienced male homing pigeons responded for food on a multiple schedule in which periods of green-key illumination alternated with periods of red-key illumination. When behavior had stabilized with a variable-interval 2-min schedule of reinforcement operating during both stimuli, low rates of responding were differentially reinforced during the green component. Response rates during the green component fell without changing the frequency of reinforcement, but there were no unequivocal contrast effects during the red stimulus. The frequency of reinforcement during the green component was then reduced by changing to a variable-interval 8-min schedule without reducing the response rates in that component, which were held at a low level by the spacing requirement. Again, the conditions during the red stimulus were unchanged, but response rates during that stimulus increased. Results show that reductions in reinforcement frequency, independently of response rate, can produce interactions in multiple schedules. (20 ref) —*Journal abstract.*

2775. Watanabe, Shigeru & Ogawa, Takashi. (Keio U, Tokyo, Japan) **An experimental analysis of mirror image reversal effects in pigeons.** *Annual of Animal Psychology*.

1973(Dec), Vol 23(1), 1-13.—Studied the mirror-image reversal effect in the pigeon, using tilted lines. 16 Ss learned keypecking response under monocular vision. One group was presented with a single oblique line, and the other group discriminated an oblique line from its mirror image. Generalization was tested in extinction with full-length lines and half-length (radius) lines. When tested with the untrained eye, the mirror-image reversal appeared in the discrimination-training group, but not in the single-stimulus training group. Whether an S uses the upper half or lower half of a line as a cue for responding seems to depend on which half of the line was presented on the side of the eye used in training. Results support an explanation in terms of attention.—*S. Nakajima.*

2776. Wheatley, Kimbal L. & Thomas, David R. (U Colorado) **Relative and absolute density of reinforcement as factors influencing the peak shift.** *Journal of the Experimental Analysis of Behavior*, 1974(Sep), Vol 22(2), 409-418.—4 groups of 6 naive domestic pigeons each were given nondifferential training on multiple variable-interval variable-interval reinforcement schedules and then were switched to differential training involving a multiple schedule in which reinforcement density was reduced in 1 of the 2 components. The multiple schedules used in the 4 groups had the mean inter-reinforcement intervals of 1 min and .1 min in the 2 components changed to 1 min, 5 min; 2.5 min, 2.5 min changed to 2.5 min, 5 min; 12 sec, 12 sec changed to 12 sec, 24 sec; and 12 sec, 12 sec changed to 12 sec, 60 sec. In subsequently administered wavelength generalization tests, some peak shifts were observed in each condition and occurred occasionally in the absence of behavioral contrast or rate reduction in the less-reinforced component. The best predictor of peak shift was a high proportion of total responses emitted during the more-reinforced component at the end of differential training.—*Journal abstract.*

2777. Wilkie, Donald M. & Ramer, Donald G. (U British Columbia, Vancouver, Canada) **Errorless discrimination established by differential autoshaping.** *Journal of the Experimental Analysis of Behavior*, 1974(Sep), Vol 22(2), 333-340.—In Exp I, 16 naive King pigeons exposed to a differential autoshaping procedure pecked a key in the presence of the stimulus associated with reinforcement but did not peck, or pecked infrequently, in the presence of the stimulus associated with nonreinforcement. In Exp II, 2 additional Ss were exposed to a differential autoshaping procedure in which 1 stimulus was associated with reinforcement and 2 stimuli were associated with nonreinforcement. Ss initially responded in the presence of 1 stimulus associated with nonreinforcement but never responded in the presence of the 2nd stimulus associated with nonreinforcement. They were subsequently exposed to an autoshaping procedure in which reinforcement followed both these stimuli. The number of stimulus-reinforcement pairings required to establish pecking in the presence of the stimulus during which responses had not previously occurred suggested that such stimuli are inhibitory. These findings have implications for autoshaping, errorless discrimination, inhibition, and theories of discrimination byproducts. (23 ref)—*Journal abstract.*

2778. Will, Bruno. (U Louis Pasteur, Lab de Psychophysiologie, Strasbourg, France) **Development of "strategies" utilized by albino rats in operant conditioning.** *Animal Behaviour*, 1974(May), Vol 22(2), 370-375.—Conducted an operant-conditioning study of 32 male Wistar rats over a period of 6 mo. Observations showed that different Ss progressively adopted a highly stable behavior which could be called a "strategy." Each one of these strategies enabled the S to obtain, in a defined manner, a certain number of reinforcements within a given period. Despite their different efficiencies, each one of these strategies could be considered as correct. It is shown that the duration of the conditioning session and the mean yield per stimulus depended on the choice of a given strategy. (15 ref)—*Journal abstract.*

2779. Willis, Richard D.; Van Hartesveldt, Carol; Loken, Kristen K. & Hall, Deborah C. (U Florida) **Motivation in concurrent variable-interval schedules with food and water reinforcers.** *Journal of the Experimental Analysis of Behavior*, 1974(Sep), Vol 22(2), 323-331.—Reinforced the leverpressing of 4 food- and water-deprived male Long-Evans hooded rats on concurrent variable-interval schedules. Food reinforced one response, and water reinforced the other. Response rates in baseline were higher in the food component than in the water component. After response patterns and body weights had stabilized, Ss were given access to either food only, water only, both food and water, or neither food nor water (baseline) before daily sessions. Giving food before a session decreased percent time in the food component, decreased overall response rates for food, and increased overall response rates for water. Giving both food and water before a session resulted in a combination of prefeeding and prewatering effects. More food and more water were consumed when both were available than when only one was available before a session. (26 ref)—*Journal abstract.*

2780. Wiltz, Robert A. (Comprehensive Mental Health Board of Central Illinois, East Peoria) **Combining stimuli signalling response-dependent food and shock.** *Journal of the Experimental Analysis of Behavior*, 1974(Sep), Vol 22(2), 363-370.—Exposed 3 naive male hooded rats to a multiple schedule in which separate presentations of light and tone alternated with periods during which light and tone were absent. In Phase 1, light and tone each signaled identical variable-interval (VI) schedules of food delivery. In Phase 2, light and tone signaled separate but concurrent VI schedules of food and shock delivery. In both phases, the absence of light and tone was associated with the differential reinforcement of other behavior. Test presentations of light, tone, and a light-plus-tone combination indicated that in both phases, light-plus-tone controlled higher response rates than either light or tone alone. The combination continued to control enhanced responding even when the test stimuli signaled VI schedules of food and fixed-ratio schedules of shock. In these latter sessions, enhanced control by the combination increased shock frequency with no corresponding change in food frequency. Apparently, the level of behavior controlled by the absence of 2 single stimuli may be more important than the consequences of responding in determining the

effects of combined-stimulus presentations.—*Journal abstract.*

2781. Woodard, W. T. & Bitterman, M. E. (U Hawaii) **A discrete-trials/fixed-interval method of discrimination training.** *Behavior Research Methods & Instrumentation*, 1974(Jul), Vol 6(4), 389-392.—Describes an efficient new method of discrimination training which has several advantages over older free-operant and discrete-trials procedures. Illustrative data on reversal learning in pigeons and goldfish are presented.

2782. Woodard, William T. & Bitterman, M. E. (U Hawaii) **Autoshaping in the goldfish.** *Behavior Research Methods & Instrumentation*, 1974(Jul), Vol 6(4), 409-410.—Classically conditioned the target-striking response of 12 goldfish to target-light color, the effectiveness of the pairing (of color and reinforcement) being demonstrated by appropriate controls.

2783. Wookey, P. E. & Strongman, K. T. (U Exeter, Washington-Singer Lab, England) **Schedules of reward shift in the double runway.** *Quarterly Journal of Experimental Psychology*, 1974(Aug), Vol 26(3), 373-386.—80 male food-deprived Lister hooded rats received 62 trials in a double runway. On Trials 1-30, reward in the 1st goal box (GB1) was either always 2 food pellets or always zero pellets. All Ss received 2 pellets in the 2nd goal box (GB2). On Trials 31-62 Ss in each preshift group (GB1 reward or GB1 nonreward) were shifted to the opposite GB1 reward level on 0, 25, 50, 75, or 100% of occasions. GB2 reward remained unaltered in all cases. For Ss experiencing reward decrease, second runway (A2) run and goal speeds after nonreward were generally enhanced, both within-group and in comparison with never-rewarded controls. Comparisons of speeds after increased reward with those of always rewarded controls revealed no difference on A2 start or run but indicated impairment of A2 goal performance. With the 50% schedule of reward increase, A2 run speeds after nonreward exceeded those of never rewarded controls. Results are discussed with reference to J. H. McHose's contrast account of double runway phenomena and with A. Amsel's frustration theory. (16 ref)—*Journal abstract.*

2784. Zentall, Thomas R. & Hogan, David E. (U Pittsburgh) **Memory in the pigeon: Proactive inhibition in a delayed matching task.** *Bulletin of the Psychonomic Society*, 1974(Aug), Vol 4(2-A), 109-112.—Studied proactive inhibition in 3 experiments with 1 White Carneaux female pigeon, using a modified delayed matching-to-sample task. Proactive inhibition was defined as disruption in matching performance produced by the presentation of a stimulus prior to the sample stimulus (relative to control trials without prior stimulus presentation). In Exp I, with a prior stimulus which was not presented as one of the comparison stimuli, temporary disruption in matching performance was found with a 5-sec delay between sample and comparison stimuli but not with a 0-sec delay. In Exp II, with a prior stimulus which was later presented as the incorrect comparison stimulus, long-lasting disruption was found with a 5-sec delay but again not with a 0-sec delay. Exp III demonstrated a direct relation between the magnitude of proactive inhibition and length of the delay. These results offer some support for an interference

theory of forgetting, but also suggest that it may not be the identity of the 2 stimuli but, rather, the order of the 2 stimuli which is lost.—*Journal abstract.*

### Social & Sexual Behavior

2785. Anderson, Clark O. & Mason, William A. (U California, Primate Research Ctr, Davis) **Early experience and complexity of social organization in groups of young rhesus monkeys (*Macaca mulatta*).** *Journal of Comparative & Physiological Psychology*, 1974(Oct), Vol 87(4), 681-690.—Found that 2 6-member social groups of young rhesus monkeys, one socially deprived and the other raised with mother and age-mates, showed marked differences in the complexity of social organization. Compared to deprived Ss, experienced Ss interacted more often as trios and larger subgroups, and the response structure of their triadic subgroups was more complex. Only in the experienced group did functional aspects of triadic interactions suggest that 1 individual recognized the status relations between the other participants. These findings indicate that early social experience affects levels of social competence that transcend variations in ethologically derived response patterns and that cannot be seen in arranged dyadic encounters.—*Journal abstract.*

2786. Barash, David P. (U Washington) **Neighbor recognition in two "solitary" carnivores: The raccoon (*Procyon lotor*) and the red fox (*Vulpes fulva*).** *Science*, 1974(Aug), Vol 185(4153), 794-796.—13 male raccoons and 7 male red foxes were trapped alive and exposed to each other in captivity. Ss of each species trapped close to one another demonstrated a higher frequency of initial dominance-subordinate relationships and lower frequencies of more intense aggressive interactions than did Ss trapped at greater distances from each other. This suggests the existence of neighbor recognition and thus a rudimentary social structure within these free-living solitary species.—*Journal abstract.*

2787. Bernstein, Irwin S. & Gordon, Thomas P. (U Georgia) **The function of aggression in primate societies.** *American Scientist*, 1974(May), Vol 62(3), 304-311.—Reviews the source and role of aggressive behavior in primate societies. Competition studies of male aggression show that unfamiliar conspecifics introduced to one another for the first time exhibit considerable hostility. To study this, 36 adult male rhesus monkeys were introduced into a single enclosure and observed. The ritualization and fighting that ensued are described. The maintenance of social order and the development of socialization and social roles are also described. It is concluded that ritualized aggression within groups limits the consequences of aggressive encounters and that social mechanisms controlling aggression between groups helps pressure the species. (42 ref)—R. S. Albin.

2788. Bridges, Robert S.; Goldman, B. D. & Bryant, L. P. (U Connecticut) **Serum prolactin concentrations and the initiation of maternal behavior in the rat.** *Hormones & Behavior*, 1974(Sep), Vol 5(3), 219-226.—Measured maternal behavior and serum prolactin in pregnant and virgin female Wistar rats. Pregnant rats were either ovariectomized or sham-ovariectomized on Day 17 of pregnancy, while virgin females were ovariectomized at the same age. 2 days after surgery, nests were rated and

the 3 treatment groups were tested for responsiveness to rat pups. Both pregnant treatment groups built superior nests compared to the virgin group and also responded more frequently to rat pups within a 1-hr test period than the virgin controls. Significantly more ovariectomized pregnant Ss responded to pups than did intact pregnant Ss. Serum prolactin levels did not differ among the 3 treatments nor did exposure to pups affect serum prolactin levels. Data suggest that high levels of serum prolactin during late pregnancy are not essential for the initiation of maternal behavior in the rat. (19 ref) —*Journal abstract.*

2789. Cook, W. T. & Siegel, P. B. (Allied Mills Industries Poultry, Summer Hill, NSW, Australia) **Social variables and divergent selection for mating behaviour of male chickens (*Gallus domesticus*).** *Animal Behaviour*, 1974(May), Vol 22(2), 390-396.—Heterosexual or unisexual contact of juvenile male chickens from 2 lines divergently selected for male mating frequency and from a control line had little, if any, influence on their subsequent mating behavior. The interaction of Lines  $\times$  Social Environments for mating behavior was not significant, showing that lines responded in a similar manner to the environments. It is hypothesized that selection for low cumulative number of completed matings (CNCM) was primarily for higher neural thresholds, whereas selection for high CNCM affected loci operative after neural thresholds were attained. The magnitude of the sexual component of a court was dependent on the genetic background of the population, being less in the low-mating than in the high-mating line. (18 ref)—*Journal abstract.*

2790. Davis, Roger E.; Harris, Colin & Shelby, Jessie. (U Michigan, Mental Health Research Inst) **Sex differences in aggressivity and the effects of social isolation in the anabantoid fish, *Macropodus opercularis*.** *Behavioral Biology*, 1974(Aug), Vol 11(4), 497-510.—Evaluated aggressiveness in Exp I in 10 male and 10 female adult anabantoid fish by measuring (a) the frequency of aggressive displays that individuals made toward a mirror image stimulus following varying periods of social isolation; (b) the display frequency in brief, unisexual and bisexual bouts with live opponents; and (c) the reinforcing effects of mirror image stimulation on performance of an approach response. In Exp II isolation up to 7 days increased aggressivity in both 6 males and 6 females. Males performed lateral display toward a mirror image or a live conspecific more frequently than females. Mirror image stimulation also was a stronger positive reinforcer in males than in females. (25 ref)—*Journal abstract.*

2791. Deets, Allyn C. (U Pittsburgh, Lab of Clinical Science) **Age-mate or twin sibling: Effects on interactions between monkey mothers and infants.** *Developmental Psychology*, 1974(Sep), Vol 10(5), 748-763.—Examined the effects of the twin sibling relationship upon interactions between mother and infant. 12 rhesus monkey infants were reared with a mother and nonsibling peers; 8 had an age-mate or twin sibling, while 4 control infants did not. The sibling pairs were formed by fostering newborns 2 to a mother; the control infants were fostered 1 to a mother. Findings indicate that the infants did not engage in as much interaction with

their mothers throughout a 7-mo period of observation on a wide range of indexes, including such basic behaviors as a contact with the mother's ventrum and nipples. The mothers rearing twins spent less time cradling their infants and less frequently rejected them. There were a few additional differences, notably in the area of restrictive behavior, but it is concluded that the differences in maternal behavior were principally a reaction to the differences in infant behavior. (27 ref) —*Journal abstract.*

2792. Drickamer, Lee C. (Williams Coll) **Contact stimulation, androgenized females and accelerated sexual maturation in female mice.** *Behavioral Biology*, 1974(Sep), Vol 12(1), 101-110.—In Exp I adult female mice previously given 100  $\mu$ g of testosterone propionate on Day 1 of age were placed with 21-day-old females producing an acceleration of vaginal introitus and 1st vaginal estrus in the young females. Young test females placed with intact adult males attained 1st estrus at 27.9 days of age while test females placed with neonatally androgenized females matured at 30.5 days of age and single control females matured at 34.0 days of age. Androgenized females caused an acceleration of maturation in young females, but not by the production of an acceleratory pheromone as in adult intact males. Exp II demonstrated that contact stimulation with the young females by neonatally androgenized adult females was equal in quantity and similar in quality to the contact by normal adult males. In Exp III young females were exposed to the continued presence of a neonatally androgenized adult female and a daily sample of male-soiled bedding containing the maturation-accelerating pheromone; these females matured at 28.1 days of age. Contact stimulation may explain the acceleration of sexual development produced by placing young female mice with neonatally androgenized adult females. (24 ref)—*Journal abstract.*

2793. Eaton, G. Gray & Resko, John A. (Oregon Regional Primate Research Ctr, Beaverton) **Plasma testosterone and male dominance in a Japanese macaque (*Macaca fuscata*) troop compared with repeated measures of testosterone in laboratory males.** *Hormones & Behavior*, 1974(Sep), Vol 5(3), 251-259.—In 2 experiments, plasma testosterone levels measured by radioimmunoassay did not correlate with dominance rank or aggressive behavior in 21 adult males of a natural troop of Japanese macaques. Data were replicated during 2 consecutive breeding seasons. Levels of male dominance and aggressive behavior were highly correlated from year to year, but testosterone levels of individual males were not. Individual levels of testosterone were also not correlated in 5 laboratory males sampled every 15 min over a 2-hr period. Laboratory males showed multiple, apparently random peaks but the mean testosterone level of 11.73 ng/ml did not vary significantly throughout the 120-min study period. By demonstrating that the stress of blood collection did not depress plasma testosterone titers in laboratory males, data validate the method used in the study of the natural troop. (33 ref)—*Journal abstract.*

2794. Ewbank, R.; Meese, G. B. & Cox, J. E. (U Liverpool, Faculty of Veterinary Science, England) **Individual recognition and the dominance hierarchy in**

- the domesticated pig: The role of sight. *Animal Behaviour*, 1974(May), Vol 22(2), 473-480.—Studied the role of sight in the dominance hierarchy of groups of 8 Large White or Large White  $\times$  Landrace pigs by the induction of temporary blindness using opaque contact lenses or hoods. The effect of blindness was examined in 3 social situations: (a) 8 previously unacquainted, blinded Ss were simultaneously introduced; (b) groups of Ss with a known social order were blinded and (c) a single S within a group of known social order was blinded. Contact lenses had a minimal effect on the hierarchy formation while both lenses and hoods had no effect on the established groups. The hoods prevented hierarchy formation among the unacquainted Ss. It is suggested that sight alone is not necessary for hierarchy maintenance and that the hoods stopped the formation of a hierarchy by an effect other than the deprivation of sight (e.g., by covering pheromone-producing areas). (15 ref)—*Journal abstract*.
2795. Harkins, Steve; Becker, Lee A. & Wright, Dennis C. (U Missouri) Gregariousness and aggression in wild and domestic rats. *Bulletin of the Psychonomic Society*, 1974(Aug), Vol 4(2-B), 119-121.—Observed 10 pairs of wild and domestic rats (*Rattus norvegicus*) in an open field. Domestic pairs engaged in more gregarious contact and were less variable in their contact scores than wild rats ( $p < .01$ ). Domestic rats were more active and produced fewer boluses than wild rats. Unlike the wild pairs, domestic rats did not engage in aggressive behaviors. Results support the hypothesis that, in the laboratory, social behaviors of domestic rats, including behaviors related to social dominance, are different than the social behaviors of wild rats.—*Journal abstract*.
2796. Herrenkohl, Lorraine R. (Temple U) Mousekilling in virgin, pregnant and lactating rats. *Physiology & Behavior*, 1974(Jul), Vol 13(1), 171-173.—Virgin, early and late pregnant, and early lactating ( $n = 20$  in each) Sprague-Dawley rats were presented with a mouse for 30 min a day for 2 consecutive days. Mousekilling was observed on only 2 trials. Generally, rat and mouse ignored each other, even when rat pups lived with lactating rats. It is suggested that to better assess the effects of reproductive state on predation, studies are needed that vary strain (use of high mousekillers), hunger conditions, and type of mouse. (21 ref)
2797. Huang, Diana & Hazlett, Brian A. (U Michigan) Submissive distance in the golden hamster *Mesocricetus auratus*. *Animal Behaviour*, 1974(May), Vol 22(2), 467-472.—In a total of 20 male golden hamsters, observations on S pairs indicated that the average distance at which the Ss showed submissive behavior patterns was significantly variable. This distance was significantly higher in Ss which had been isolated than in those which had been housed in groups of 4. Also, this distance was affected significantly for isolates by the previous amount of experience they had had in the observation box. Ranking Ss by distance at which they showed submissive patterns was negatively correlated with a ranking by dominance. (21 ref)—*Journal abstract*.
2798. Hurley, Ann C. & Hartline, Peter H. (U California, San Diego) Escape response in the damselfish *Chromis cyanea* (Pisces: pomacentridae): A quantitative study. *Animal Behaviour*, 1974(May), Vol 22(2), 430-437.—Models of different sizes, shapes, and colors evoked oriented escape responses in schools of damselfish in their natural coral-reef habitat. Divers filmed these responses; from the films, the distance of the school from the model at the instant of response (reaction distance) was calculated. For a given model, reaction distance was independent of the speed of the model's approach. Darker-colored models were more effective in causing escape than lighter-colored models, suggesting contrast as an important feature of the stimulus. Larger models were more effective than smaller ones. Habituation to repeated stimuli was absent for intertrial intervals from .5 to 4 min. Natural behavior of damselfish suggests that cues such as sound, vibration, and details of shape, colors, and motion also play a role in triggering escape. (24 ref)—*Journal abstract*.
2799. Johnston, Robert E. (Cornell U) Sexual attraction function of golden hamster vaginal secretion. *Behavioral Biology*, 1974(Sep), Vol 12(1), 111-117.—A total of 6 sexually experienced and 16 sexually naive male hamsters (*Mesocricetus auratus*) were tested in their home cages for attraction to various female hamster odors. An odor was presented inside 1 stimulus bottle while a 2nd bottle was a clean control. Experienced and naive Ss were strongly attracted to the vaginal secretion of estrous as well as 1-day postestrous females and spent a large percentage of test time sniffing at this odor. The odor also elicited licking of the bottle top, even though the males could not lick the secretion. After standing in the air at 22°C for 12 or 24 hrs, the attractiveness of the vaginal secretion was greatly reduced. Males were not attracted to female urine odors. These 3 experiments demonstrate a sex-attractant function for the hamster vaginal secretion odor. (15 ref)—*Journal abstract*.
2800. Kaufmann, John H. (U Florida) Social ethology of the whiptail wallaby, *Macropus parryi*, in Northeastern New South Wales. *Animal Behaviour*, 1974(May), Vol 22(2), 281-369.—Reviews macropod studies from the literature and presents the taxonomy and description of the whiptail wallaby during joey, young-at-foot, subadult, and adult stages. The species' distribution and status; the study area and methods of observation from October 1966 to November 1967; individual, intra-, and intermob behavior; reproductive biology and mating behavior; home range and movements; and the ecology of social movements are detailed. Photographs and diagrams are included. (5 p ref)—B. McLean.
2801. Kunkel, Peter. (IRSAC Inst pour la Recherche Scientifique en Afrique Centrale, Lwiro, Zaïre) Mating systems of tropical birds: The effects of weakness or absence of external reproduction-timing factors, with special reference to prolonged pair bonds. *Zeitschrift für Tierpsychologie*, 1974(Mar), Vol 34(3), 265-307.—Reviews breeding activities in tropical birds, showing that behavioral means are important in overcoming nonsynchronization of gonadic cycles of potential mates. Among these behaviors are colonial breeding, particularly elaborated courtship displays, and different mating types such as prolonged or permanent pair bond and a close group bond. (German summary) (244 ref)
2802. Maple, Terry; Erwin, J. & Mitchell, G. (U California, Davis) Sexually aroused self-aggression in a socialized, adult male monkey. *Archives of Sexual*

*Behavior*, 1974(Sep), Vol 3(5), 471-475.—Observed an abnormal but apparently successful sexual posture in an adult male rhesus monkey that bit its hands and leg when dismounting. This behavior followed each of several mounts but ceased toward the end of the series, culminating in ejaculation. The animal's rearing history suggests that early partial isolation may produce long-lasting abnormalities which, while unusual, need not seriously affect successful copulation.

2803. O'Connell, Richard H. (California State U, Northridge) **Spontaneous alteration and emotionality in rats with differential early experience.** *Bulletin of the Psychonomic Society*, 1974(Aug), Vol 4(2-B), 135-136.—Studied the relationship between emotionality measures and spontaneous alternation in 14 male Wistar albino rats which had been differentially handled as pups. Handled rats had less emotional open-field activity patterns over a 90-day period and alternated more than nonhandled rats.

2804. Petrinovich, Lewis. (U California, Riverside) **Individual recognition of pup vocalization by northern elephant seal mothers.** *Zeitschrift für Tierpsychologie*, 1974(Mar), Vol 34(3), 308-312.—Using both playback of recorded pup distress vocalizations and observational data, it was found that female elephant seals (*Mirounga angustirostris*) could distinguish the distress vocalizations of their own from those of other pups. The possible adaptive significance of the specific recognition system is discussed. (German summary)

2805. Plaut, S. Michael; Thal, Arlene; Haynes, E. Eugene & Wagner, Joseph E. (U Maryland, Medical School, Inst of Psychiatry & Human Behavior, Baltimore) **Maternal deprivation in the rat: Prevention of mortality by nonlactating adults.** *Psychosomatic Medicine*, 1974(Jul), Vol 36(4), 311-320.—Conducted 4 experiments with rat litters permanently deprived of their mother at age 13 days. Some litters were housed with a male or virgin female. Although over 90% of the adult-deprived pups died between 18 and 21 days of age, most mortality was prevented by the presence of a nonlactating adult. Survival could be attributed largely to the opportunity for tactual contact between pups and the adult, even though a significant amount of mortality could be prevented even by housing maternally deprived pups with a female from whom they were separated by a double wire screen. Postmortem examinations at 17 days disclosed that maternally deprived litters housed with and without adults did not differ in weight, skeletal growth, or presence of solid food in the stomach. Pups without adults retained more urine than those housed with adults. However, no renal damage was found, and direct stimulation of urination did not prevent mortality. (20 ref)—*Journal abstract*.

2806. Reite, Martin; Kaufman, I. Charles; Pauley, J. Donald & Stynes, A. J. (U Colorado, Medical Ctr, Denver) **Depression in infant monkeys: Physiological correlates.** *Psychosomatic Medicine*, 1974(Jul), Vol 36(4), 363-367.—Separated 4 24-35 wk old pigtail monkeys from their mothers. The initial response was agitation, with elevated heart rate and body temperature. In the subsequent depressive reaction all 4 Ss experienced a night of impaired sleep and profound hypothermia. The next morning the 2 youngest Ss were severely depressed

behaviorally; the 2 older ones showed some but not all depressive behavioral characteristics. Relative bradycardia persisted, and in all Ss the maximum body temperature recorded on the day following separation was lower than any daily maximum during the baseline period. Possible explanations for the behavioral depression are considered. (15 ref)—*I. Davis*.

2807. Sambras, Hans H. (U Munich, W Germany) **[Das sexualverhalten der domestizierten einheimischen Wiederkäuer. (Sexual behavior of domesticated native ruminants.)]** (Germ) Berlin, W Germany: Paul Parey, 1973. 100 p.

2808. Sherrod, Lonnie. (Duke U) **The role of sibling associations in the formation of social and sexual companion preferences in ducks (*Anas platyrhynchos*): An investigation of the "primacy versus recency" question.** *Zeitschrift für Tierpsychologie*, 1974(Mar), Vol 34(3), 247-264.—Analyzes roles of early and juvenile experiences in the development of mate preferences in ducks. In choice situations Ss exposed solely to their own variety during the juvenile period, irrespective of previous experience, exhibited a significant preference for own-variety Ss; Ss raised in mixed groups during the juvenile period did not show this preference. Ss which did not experience a switch in social experience, however, exhibited the most pronounced preferences. It is concluded that experience during the juvenile period was most important in determining both social and sexual companion preferences, though earlier experience was of some significance. Results are inconclusive concerning the importance of most recent experience vs experience during an earlier juvenile critical period. Preferences seem to be affected by a variety of factors such as length of contact with companions, social experience during the juvenile period, and whether or not experience of own kind has occurred. (German summary) (25 ref)—*E. Furchtgott*.

2809. Weygoldt, Von Peter. (Albert-Ludwigs U, Freiburg, W Germany) **[Courtship and mating of the whip scorpion *Charinus montanus*.]** (Germ) *Zeitschrift für Tierpsychologie*, 1974(Mar), Vol 34(3), 217-223.—Observed, in a laboratory setting, the courting or prelude, formation of the spermatophore, and sperm transfer in the whip scorpion. The prelude consists of short and quick movements of the male, rushing forward to the female. Sperm transfer is achieved by the male pulling the female over the spermatophore. This behavior is very different from that of *C. brasiliensis* in which the male performs a spectacular dance behind its spermatophore. The different behavior of 2 closely related species during sperm transfer may be explained as an isolating mechanism. (English summary)—*E. Furchtgott*.

2810. Wise, Dale A. (Mount Holyoke Coll) **Aggression in the female golden hamster: Effects of reproductive state and social isolation.** *Hormones & Behavior*, 1974(Sep), Vol 5(3), 235-250.—Observed the aggressive behavior of 147 intact female hamsters toward males at various times during the estrous cycle, pseudopregnancy, pregnancy, and lactation. Estrous cycle females also were tested after varying periods of social isolation. Pregnant and especially lactating hamsters were more aggressive than pseudopregnant or estrous cycling females. Aggression tended to be higher on the day

preceding behavioral estrus of the estrous cycle, on Day 10 of pregnancy, and on the 1st 5 days of lactation. Except for pseudopregnancy, sexual behavior unaccompanied by aggression occurred during all reproductive conditions, and both sexual behavior and aggression occurred together on Day 10 of pregnancy and Day 1 of lactation. Changes in aggressive behavior associated with reproductive states were attributed to increased male interest, inhibition by ovarian hormones, and facilitation by prolactin. Increasing periods of social isolation were also associated with increased aggression. (44 ref) —*Journal abstract.*

2811. Yeo, Anthony G. (Brunel U, Uxbridge, England) **The acquisition of conditioned suppression as a function of interstimulus interval duration.** *Quarterly Journal of Experimental Psychology*, 1974(Aug), Vol 26(3), 405-416.—Investigated the effect of interstimulus interval (ISI) variation on the acquisition of a classically conditioned emotional response to footshock using a 1-trial conditioning procedure with 72 male hooded rats. The optimum ISI was found to be 10 sec, with a bidirectional gradient for conditioned suppression at ISI above and below 10 sec. Control groups demonstrated that conditioning was not a function of either pseudo-conditioning, sensitization or stimulus novelty. (22 ref) —*Journal abstract.*

### Sensory Processes

2812. Bronstein, Paul M. & Dworkin, Terry. (Brooklyn Coll, City U New York) **Replication: The persistent locomotion of immature rats.** *Bulletin of the Psychonomic Society*, 1974(Aug), Vol 4(2-B), 124-126.—In a series of both cross-sectional and longitudinal experiments, 15-day-old Sprague-Dawley albino rats were found to locomote persistently in both horizontally and vertically striped mazes. 30-day-old Ss displayed a within-trial decrement in activity typical of adult ambulation patterns. Data support the conclusion that 15-day-old rats may be behaviorally similar to adults with hippocampal lesions.—*Journal abstract.*

2813. Dormer, Kenneth J. (Marine Biomedical Inst, Galveston, TX) **A stimulation-recording technique for evaluating binaural sound processing in porpoises.** *IEEE Transactions on Bio-medical Engineering*, 1974(Sep), Vol 21(5), 399-405.—Describes a semiautomatic method developed to evaluate temporal and binaural aspects of the porpoise sonar receiving system at the level of the midbrain. Surgical and electronic techniques are combined to test this system and permit replication by digital computer. Pulsed-sound projectors binaurally simulate porpoise sonar clicks underwater, in an azimuth about their heads. Precise control of the interaural time differences and repetition rates of the projectors was by an oven-regulated crystal time delay generator. The determination of pulse amplitudes, the new surgical techniques used to protect the animal from bacteria and the hardware from seawater, and the stimulation and recording systems are described.—R. S. Kennedy.

2814. Fay, Richard R. (Wake Forest U, Bowman Gray School of Medicine) **Masking of tones by noise for the goldfish (*Carassius auratus*).** *Journal of Comparative & Physiological Psychology*, 1974(Oct), Vol 87(4), 708-716.

—Using a classical respiratory conditioning technique, tonal thresholds were measured for 4 goldfish at 5 frequency points between 100 and 1,200 Hz in quiet and under 3 levels of broadband noise. Masking was a linear function of noise level at all frequencies. Signal-to-noise ratios were lowest at 100 Hz (13 db) and increased linearly with log frequency at a rate of 3 db/octave. The values at frequencies above 200 Hz were about 2.5 db above those previously found for the cat and at 1,200 Hz were considerably below those for the rat. Below 200 Hz, however, the values fell below those reported for humans. This sensitivity of the fish in detecting signals in noise provides support for the notion that a mechanical frequency-to-place transformation at the periphery of an auditory system is not a necessary assumption in accounting for some aspects of frequency analysis. (31 ref) —*Journal abstract.*

2815. Jander, Rudolf & Quadagno, David M. (U Kansas) **An interval scale for measuring visual pattern discrimination of a mammal (*Rattus norvegicus*).** *Behavioral Biology*, 1974(Sep), Vol 12(1), 93-99.—10 male Long-Evans hooded rats, trained to horizontal or vertical stripes, were scored on visual stripe tilt discrimination in a series of binary choice tests. The resulting choice-percent-scales were linear measurements (interval scales) of the stripe tilt differences as perceived by the Ss. A crude model system for describing and explaining the binary choice behavior of rats is propounded. 3 main processes constitute this model system. The 1st determines the magnitude of similarity between any pattern offered and the previous training pattern. The 2nd compares these similarity-magnitudes by subtraction, and the 3rd injects evenly distributed noise into the system, thus accounting for the scatter in the choice behavior. The similarity functions (generalization gradients) for the edge orientation in the visual field of the rat range over  $\pm 90^\circ$ , which appears to be typical for both vertebrates and arthropods. (19 ref) —*Journal abstract.*

2816. Kagawa, Motomichi. (Chukyo U, Nagoya, Japan) **[An analysis of alcohol preference in rats with alcohol vs alcohol two-bottle method.]** (Japn) *Annual of Animal Psychology*, 1973(Dec), Vol 23(1), 15-25.—Studied the relative preference for 3, 5, 7, and 9% alcohol (by volume) solutions in white rats. 19 Ss drank from 2 bottles, containing different concentrations of alcohol, until all combinations of concentrations were tested in a counterbalanced order. Tap water was available from both bottles on alternate days. The Ss were classified into 3 types: those showing the maximal preference at relatively high, relatively low, and intermediate concentrations. The alcohol-alcohol 2-bottle method is considered to be a valid technique in determining the point of maximal preference. (English summary)—S. Nakajima.

2817. Rajecki, D. W. (U Wisconsin, Madison) **Effects of prenatal exposure to auditory or visual stimulation on postnatal distress vocalizations in chicks.** *Behavioral Biology*, 1974(Aug), Vol 11(4), 525-536.—In 2 experiments with a total of 125 DeKalb hybrid White Leghorn chick embryos, Ss were exposed, without insult, to intermittent stimulation by either light or sound from Day 13 to Day 18 of incubation. Control Ss were incubated in relative quiet and darkness. All were

observed for tendency to emit distress calls in the presence and absence of the 2 stimulus modes in tests conducted 4-12 hrs after hatching. As measured by reduction in distress calling, results from both experiments show that Ss that had received prenatal stimulation in a particular sensory mode were most responsive to that mode. Prenatal exposure to sound seemed to produce stronger effects than prenatal exposure to light. Findings are discussed in the context of the possible consequences of normal parental stimulation of incubating eggs under natural conditions. (18 ref)—*Journal abstract*.

2818. Ridley, R. M. (Inst of Psychiatry, London, England) **Non-equivalence of vertical and horizontal planes in stripe discrimination by monkeys.** *Neuropsychologia*, 1974(Jul), Vol 12(3), 407-408.—Tested 4 monkeys for direct and reversal transfer of a task presented in both vertical and horizontal planes. Transfer was found within but not across planes. (French & German summaries)

2819. Sternthal, David E. (U Waterloo, Ontario, Canada) **Olfactory and visual cues in the feeding behavior of the leopard frog (*Rana pipiens*).** *Zeitschrift für Tierpsychologie*, 1974(Mar), Vol 34(3), 239-246.—Analysis of cues used by the leopard frog in feeding behavior showed that Ss could discriminate between noxious and non-noxious prey using olfactory, visual, or compound (visual + olfactory) cues. Fastest responding occurred to compound and slowest to olfactory cues. (German summary) (25 ref)

## DEVELOPMENTAL PSYCHOLOGY

2820. Baumeister, Alfred A. & Maisto, Albert A. (George Peabody Coll for Teachers) **Interactive effects of age and familiarization in paired-associate learning.** *Developmental Psychology*, 1974(Sep), Vol 10(5), 657-660.—Prior to learning a list of paired associates consisting of pictures of common objects, 40 preschool and 40 2nd graders were given 1 of 4 familiarization conditions: stimulus pretraining, response pretraining, irrelevant pretraining, and no pretraining. Results show that the 2nd graders exhibited positive transfer from familiarization to paired-associate learning due to nonspecific factors such as "warm-up." The preschoolers, however, displayed positive transfer due to more specific factors inherent in response and stimulus pretraining. These results suggest that the pretraining experience facilitated rehearsal by making available verbal labels. Results are consistent with (a) developmental hypotheses that emphasize growth in discriminative capacity and/or verbal mediation and (b) phase theories of paired-associate learning that emphasize stimulus and response learning stages.—*Journal abstract*.

2821. Beaudichon, Janine & Melot, Anne-Marie. (U René Descartes, Lab of Genetic Psychology, Paris, France) **[The emergence and function of soliloquy.]** (Fren) *Psychologie Française*, 1972(Jun), Vol 1(1-2), 33-42.—Attempted to test 3 hypotheses originally formulated by L. S. Vygotsky: (a) The amount of soliloquy decreases with age. (b) There is a relation between the nature of the soliloquy and the nature of a

task. (c) The amount of soliloquy increases when an unforeseen problem requires a solution. Ss were 60 boys and girls in 3 age groups, 6, 8, and 10 yrs. They were presented with a series of tasks of varying complexity, including an unforeseen problem which required for its solution the transfer of prior learning. Analysis of audio and video recordings of S behavior shows that verbalization decreased significantly between 6 and 8 yrs ( $p < .01$ ). The most frequent category of speech was regulatory (rather than affective or entertaining). The nature of regulatory speech varied with the task and was related to it. Speech increased at 6 and 8 yrs, but not at 10, when the unforeseen problem arose. (31 ref)—A. Blasi.

2822. Borstelmann, L. J. (Duke U) **Classics in developmental psychology: Historical persons and studies of common textbook reference.** *Developmental Psychology*, 1974(Sep), Vol 10(5), 661-664.—A survey of current textbooks in developmental psychology for common citation of pre-1940 publications reveals the historical significance of Darwin, Freud, Piaget, A. Gesell, G. S. Hall, and J. B. Watson as evidenced by contemporary reference to their multiple works. Others gain consensual citation from particular studies that represent landmark investigations. (44 ref)

2823. Braine, Martin D. (New York U) **Length constraints, reduction rules, and holophrastic processes in children's word combinations.** *Journal of Verbal Learning & Verbal Behavior*, 1974(Aug), Vol 13(4), 448-456.—Examination of empirical claims indicates that there is no real evidence that the apparently elliptical character of many early word combinations is due to deletion of content, or that there is a performance constraint that prevents children producing the longer utterances that their grammars could generate. Evidence is presented that questions the presumption, implicit in the length-constraint claim, that a constituent is less likely to be expanded (without deletion) when there are co-occurring constituents. The special character of both early word combinations and holophrases is explained by a lexical-insertion process in which a word representing a salient feature of the communication is inserted into an inappropriately high node, because the child lacks complete control of rules to realize the communication more fully.—*Journal abstract*.

2824. Caldwell, Bettye M. (U Arkansas, Coll of Education) **Can young children have a quality life in day care?** *Young Children*, 1973(Apr), Vol 28(4), 197-208.—Views day care in the context of social evolution as a manifestation of the professionalization of child care and not simply as an ad hoc procedure created to perform desired social services. The history of day care in the US is briefly reviewed and research data from studies concerning the effect of day care on young children is summarized. Quality day care was associated with intellectual gains, with the acquisition of adaptive social skills, and with healthy physical and emotional development. (15 ref)—R. S. Albin.

2825. Carroll, Jackson W. & Jenkins, Gerald P. (Emory U, Candler School of Theology) **The development of religious commitment: Some exploratory research.** *Journal of Pastoral Care*, 1973(Dec), Vol 27(4), 236-252.—Describes an interview method used to gather

data about a person's religious history and significant experiences. Open-ended questions investigated 11 categories of experience including significant relationships, groups, important decisions, events over which the person had little control, temptations not acted on, values or philosophy of life, wishes, regrets, hopes, and religion. From summaries of the interview data, inferences are drawn about the person's self-concept, world view, and "ultimate concern." Case histories confirm a consistency among these 3 areas and illustrate how experiences, especially with significant others, play a crucial role in the development of self-concept, world view, and ultimate concern.—*B. Smith.*

2826. Claiborne, Robert. *God or beast: Evolution and human nature.* New York, NY: W. W. Norton, 1974. xiii, 260 p. \$7.95.—Delineates the inherited likes, dislikes, and tendencies which shape human behavior, drawing from studies of subhuman primates—apes and monkeys. Among the topics discussed are learning, family life, aggression, the creative impulse, and the sex relationship. (4 p ref)

2827. Cosby, Arthur G. (Texas A&M U) *Occupational expectations and the hypothesis of increasing realism of choice.* *Journal of Vocational Behavior*, 1974(Aug), Vol 5(1), 53-65.—A 2-wave analysis of the dynamics of occupational expectations in a rural youth panel ( $N = 196$  male high school students) generally failed to support the hypothesis of increasing realism of choice. An analysis of 4 multiple regression equations indicated that (a) black youth tended to lower their levels of occupational expectations over time and (b) occupational expectations tended to vary with changes in occupational aspirations and educational expectations. However, family socioeconomic index, perception of occupational goal blockage, 3 measures of self-image, and change in perception of occupational goal blockage, were not associated with the dynamics of occupational expectation.—*Journal abstract.*

2828. Cramer, Bertrand. *Some sex differences in children between three and seven.* *Psychosocial Process*, 1970, Vol 1(2), 60-76.—Assessed sex differences once a year for 3 yrs in 25 male and 19 female 3-5 yr olds. Each assessment included an interview with the mother, an interview with the teacher, a play interview with the child, and 2 periods of observation of the child in the classroom. Girls showed a predominance of overcontrol of aggression, impulses, and affect, whereas boys showed a tendency toward lack of impulse control, particularly in regard to aggression. Girls showed a persistent predominance of sad affect, oral autoerotic behaviors, and a tendency toward social isolation and withdrawal. However, most behaviors were transitory. (22 ref)—*J. M. Kleinman.*

2829. Engen, Trygg; Lipsitt, Lewis P. & Peck, Marjorie B. (Brown U) *Ability of newborn infants to discriminate sapid substances.* *Developmental Psychology*, 1974(Sep), Vol 10(5), 741-744.—Observed taste preferences in newborn infants to determine (a) the ability of newborns to discriminate different sapid substances and different molar concentrations within those substances and (b) the role of immediate prior sucking and ingestion experience in altering subsequent oral behavior. Ss were 48 male and 48 female full-term,

single birth 1-3 day old infants. Results show that the sucking rate varied with the substance (glucose, sucrose, and water) delivered through the nipple and with the order in which the substances were presented within a test session. Amount of fluid delivery was controlled automatically by the infant's own sucking behavior, a procedure which provides a taste preference report as well as evidence of the discriminability of taste substances. It remains to be demonstrated that profound taste aversions, resulting in complete inhibition of sucking, are also present at this young age.—*Journal abstract.*

2830. Eysenck, Michael W. & Baron, Cynthia R. (Birkbeck Coll, U London, England) *Effects of cuing on recall from categorized word lists.* *Developmental Psychology*, 1974(Sep), Vol 10(5), 665-666.—Explored the retrieval-deficit hypothesis by comparing free-recall under cued and noncued conditions in 2 groups of 36 5- and 8-yr-olds. On a 16-word list containing either 2, 4, or 8 categories, Ss received 2 trials of noncued recall. The 2nd trial was immediately followed by a test for cued recall. A comparison between cued recall performance and noncued recall performance on Trial 2 indicates that the younger children benefited more than the older children from the cuing procedure. For both age groups, there were effects of cuing on both the number of categories recalled and the number of items per category recalled. Clustering was observed at both age-levels but appeared unrelated to recall performance. Some of the results are discussed in connection with a retrieval deficit hypothesis.—*Journal abstract.*

2831. Feeley, Joan T. (William Paterson Coll) *Interest and media preferences of middle-grade children.* *Reading World*, 1974(Mar), Vol 13(3), 224-237.—Attempts to identify and describe the content interest patterns and media preferences (print and TV) of today's middle-grade children to determine if these patterns and preferences are related to sex, race, or socioeconomic status (SES). A 50-item inventory of "things to watch and read" was presented to 250 boys and 282 girls in 4th and 5th grade. Results demonstrate that sex and SES continue to shape children's interests; traditional boy-girl patterns and class differences emerged. All Ss preferred to watch rather than to read content of all kinds. Implications for educators, publishers, TV producers, and government are discussed.—*R. S. Albin.*

2832. Flapan, Dorothy; Gunn, Gwen & Neubauer, Peter B. *Sources of information for developmental assessment.* *Psychosocial Process*, 1970, Vol 1(2), 98-115.—Compares developmental assessments derived separately from 5 sources of information, from combinations of the individual sources, and from an integration of all 5 sources. A nonclinical sample of 25 boys and 20 girls 3-4 yrs old was evaluated through mother interviews, teacher interviews, child interviews, observations of the child in school, and formal psychological testing. The psychological examination provided the least favorable assessment of both boys and girls. School observation provided the most favorable assessment for boys and child interviews the most favorable for girls. No single source of information gave a valid and reliable assessment of the child's development, although the mother interview and the teacher interview each made a major contribution;

an assessment based on the combination of these 2 interviews agreed with the overall evaluations for approximately 90% of the children studied. (16 ref)—J. M. Kleinman.

2833. Hendrick, Clyde; Hoving, Kenneth L. & Franz, Christine M. (Kent State U) **Children's likableness ratings of 22 trait adjectives.** *Bulletin of the Psychonomic Society*, 1974(Aug), Vol 4(2-A), 91-92.—Children in kindergarten and Grades 2, 4, and 6 ( $n = 12$ ) rated the likability of 22 common trait adjectives. The mean ratings and standard deviations are given for each trait. Analysis of variance revealed that only 2 of the 22 traits showed significant differences across grade levels. The data indicate that the evaluative meaning for this set of traits was remarkably stable and that the conventional meaning of common trait words was achieved at an early age.—*Journal abstract.*

2834. Kopp, Claire B.; Sigman, Marian & Parmelee, Arthur H. (U California, Los Angeles) **Longitudinal study of sensorimotor development.** *Developmental Psychology*, 1974(Sep), Vol 10(5), 687-695.—Assessed the longitudinal performance of 24 healthy full-term infants from middle-class homes using an adapted version of scales by I. Casati and I. Lézine measuring stages of sensorimotor intelligence in children. The study focused on the rate of acquisition of differing sensorimotor behaviors, variability in the performance of these behaviors, and the relationship between performance on the various subtests. Results show that although there was an overall progression in stage development for the behaviors studied, occasional declines in performance were also present. Performance on one subtest was generally unrelated to performance on another subtest. In addition, longitudinal data on the development of object permanence compared favorably with previously reported results from a cross-sectional sample. (18 ref)—*Journal abstract.*

2835. Matheny, Adam P.; Dolan, Anne B. & Wilson, Ronald S. (U Louisville, Medical School) **Bayley's Infant Behavior Record: Relations between behaviors and mental test scores.** *Developmental Psychology*, 1974(Sep), Vol 10(5), 696-702.—Analyzed ratings on Bayley's Infant Behavior Record and test scores from the Bayley Mental Scale for 60 female and 50 male infants over a 2-yr period, at ages 6, 12, 18, and 24 mo. Results show significant relationships between certain behaviors and mental test scores. Composite scores were calculated for 2 behavioral clusters—one composed of behaviors relating to Primary Cognition and the other to Extraversion—and these composite scores were correlated with both concurrent and subsequent mental test scores. The Extraversion composite was related to concurrent mental scores for females but not for males, and had no predictive utility for either sex. In contrast, the Primary Cognition composite was strongly associated with mental test scores both concurrently and predictively for both sexes, although the patterns were somewhat more cohesive for males. The Extraversion composite showed very little age-to-age stability, whereas the Primary Cognition score was stable from age to age, particularly for males. Results raise questions about the appropriateness of including social items in infant mental tests since these behaviors show neither stability nor prognostic

utility. Cognitive, task-oriented behaviors were more stable and had prognostic value approaching that of the mental test score itself. (21 ref)—*Journal abstract.*

2836. Mickish, Virginia. (DeKalb County Board of Education, Div of Instruction, Decatur, GA) **Children's perceptions of written word boundaries.** *Journal of Reading Behavior*, 1974(Apr), Vol 6(1), 19-22.—117 1st graders were asked at the end of the school year to mark word boundaries in a written sentence presented with no spaces between the words. Data indicate that many children at the end of their 1st yr of reading instruction had little idea of what words are. However, as the Ss became better readers, they were better at marking word boundaries.—*Journal abstract.*

2837. Musgrave, Peter W. & Reid, George R. (Monash U, Clayton, Vic, Australia) **Some measures of children's values.** *Social Science Information*, 1971(Feb), Vol 10(1), 137-153.—Studied children's values based on 311 male and 321 female 11-12 yr olds' reactions to mass media. 47% of the Ss were middle class and 53% were working class. Girls selected cross-sex models while boys did not. The choices of girls tended to be passive but boys made choices of male athletes and aggressive models. In moral values, killing, violence, and incompetence were evaluated as bad, helping people as good. Boys saw fighting crime as good while girls rated entertaining as good. Violence in general was seen as wrong, but more so by girls and working-class children than by boys and middle-class children; middle-class children were more accepting of capital punishment and boys were more tolerant of war. For the high IQ Ss, violence in war or police enforcement was more accepted than by low IQ Ss, but in instances of retribution or capital punishment the reverse was true. Girls liked watching TV violence somewhat less than boys but all Ss liked it. Sex influenced results more than IQ level and class had the least influence.—R. J. Anderson.

2838. Nanpon, Hubert. (U Haute-Bretagne, Rennes, France) **[Effect of age and information on verbal responses.]** (Fren) *Psychologie Française*, 1972(Jun), Vol 1(1-2), 43-54.—Studied the effects of the amount of information and of age on the uncertainty of verbal responses. Both variables were expected to reduce uncertainty. In a sentence completion task information was defined in terms of the length of the verbal context preceding the response. Uncertainty was measured in 2 ways: (a) by the reaction time and (b) by the ratio between the number of different responses given by all Ss to a stimulus and the total number of responses to the same stimulus (indeterminacy). Ss were 21 preschoolers, 21 1st graders, and 21 adults. Indeterminacy and latency decreased with age; indeterminacy and latency decreased with the length of the stimulus, particularly in the adult group; and there was a positive significant correlation between latency and indeterminacy. Findings are interpreted in terms of learning the relations between the elements of speech, adults being more able than children to use the antecedent context.—A. Blasi.

2839. Ployé, P. M. **Does prenatal mental life exist?** *International Journal of Psycho-Analysis*, 1973, Vol 54(2), 241-246.—Discusses the possibility that the more difficult moments of pregnancy could leave imprints in the mind that are just as recognizable, and recoverable as

those left by the more undisturbed moments. The possibility that there could be ways of establishing that a prenatal imprint is, in fact, a genuine imprint and not something else also is discussed. The difficulty of finding the coding system to understand prenatal experiences is cited. Possible imprints of threats to the pregnancy are described. Suggestions for further research in this field are made.—*R. S. Albin.*

2840. **Pozner, Jay & Saltz, Eli.** (Wayne State U, Ctr for the Study of Cognitive Processes) **Social class, conditional communication, and egocentric speech.** *Developmental Psychology*, 1974(Sep), Vol 10(5), 764-771. —Studied social class differences in ability to communicate conditional information using 132 5th-grade white children, who were divided into lower- and middle-socioeconomic-status (SES) groups of approximately equal IQ. Dyadic groupings were formed by combining lower- and middle-SES children into the 4 possible speaker-listener combinations. The task required speakers to use a conditional communication in describing the rules of a game to a listener. Results showed that as listeners, lower- and middle-SES children responded equally well to the communications of both lower- and middle-SES speakers. However, as communicators, the lower-SES children performed more poorly than the middle-SES children. Both lower- and middle-SES listeners had equally great difficulty complying with the instructions provided by the lower-SES communicators. The data suggest that SES differences cannot be attributed to lack of comprehension of the conditional logic. Instead, it appears that the lower-SES children were difficult to understand because of strong tendencies toward egocentric communication patterns.—*Journal abstract.*

2841. **Rosenthal, Bernard G.** (Illinois Inst of Technology) **Developments of self-identification in relation to attitudes toward the self in the Chippewa Indians.** *Genetic Psychology Monographs*, 1974(Aug), Vol 90(1), 43-142. —Studied the relation between the development of self-identification, self-evaluation, and recognition of Chippewa and white racial groups in all Chippewa 3-10 yr old children at Lac du Flambeau ( $N = 223$ ). Picture recognition tests and intensive interviews were conducted with all Ss. An Indian interviewer was used to check response reliability. Findings indicate that the Chippewa child evaluates himself more negatively than white children—69.6% of the Ss evaluated whites positively (e.g., good, clean, and nice) while only 14.9% did so for Indians. Ss did not appear to fully recognize the physical racial identity of whites and Indians until age 9, although 89% could generally recognize the groups at age 6. Recognition by the Ss that they were Indians appeared to be very slow—as late as 10 yrs of age, 36% still asserted that they were white. No more than 73% at any age ever acknowledged that they were Indian. Explanations for these findings are presented in terms of Chippewa history, socioeconomic conditions, and personality dynamics. (32 ref)—*Journal summary.*

2842. **Schlater, J. A.; Baker, A. Harvey & Wapner, S.** (Clark U) **Age changes in apparent arm length.** *Bulletin of the Psychonomic Society*, 1974(Aug), Vol 4(2-A), 75-77. —Assessed whether S. Wapner's 1959 finding, that overestimation of apparent head size was maximal in

early childhood and decreased with increase in age, is generalizable to other body parts. Age change in judged length of the outstretched arm was studied with 72 7-18 yr olds. All age groups underestimated arm length, with the magnitude of underestimation decreasing with increase in age—a pattern opposite to that found for head size. Although the age changes observed for both judged head size and arm length can be described as reflecting an increase in accuracy, such a formulation in terms of accuracy cannot explain why young children maximally overestimate head size and maximally underestimate arm length. It is suggested that future research should explore the possibility that these observed differences reflect differential organization of the body schema at different levels of development. (15 ref) —*Journal abstract.*

2843. **Ushiyama, Toshiko.** (Tokyo U of Education, Japan) **Effects of vicarious and direct reinforcement upon the occurrence of "jan-ken" behavior in kindergarten children.** [Japn] *Japanese Journal of Educational Psychology*, 1973(Jun), Vol 21(2), 79-89. —Exposed 2 groups of 30 6-yr-old boys and girls to 2 films, 1 group with random partial reinforcement, the other with total reinforcement, for imitation of "Jan Ken" behavior. Winners ate biscuits as reinforcer. Spontaneous imitating behavior was measured once after the 1st showing, and twice after the 2nd showing. Comparison of the 2 reinforcement schedules indicates that random partial reinforcement is significantly more effective ( $p < .01$ ), and that direct reinforcement intensifies the effect of vicarious reinforcement. (English summary)—*S. Choe.*

2844. **van Duijne, H. John.** (Northern Illinois U) **The facilitation of nonverbal behavior by means of self-instruction in early childhood.** *Journal of the Association for the Study of Perception*, 1974(Spr), Vol 9(1), 26-29. —Examined the relationship between age and the ability of 3-, 4-, and 5-yr-old Ss to verbalize self-instructions while performing a simple perceptual-motor task after being trained to verbalize the instructions without performing the task. Results show that this ability is significantly and directly associated with age, and that verbal responses become stronger in relationship to perceptual-motor responses with increasing age.

2845. **Vanfraechem-Raway, Renée.** (Free U Brussels, Belgium) **[An exploration of motor creativity in 15-18 year old adolescents.]** (Fren) *Revue Belge de Psychologie et de Pédagogie*, 1973(Sep), Vol 35(143), 79-88. —Explored creativity in body language shown by upper high school students of humanities. The test battery of W. Wyrick (1968) was used, which yields scores of motor fluidity and motor originality. The 6 parts present 6 situations, each conforming to 5 activity principles: (a) to evoke a measurable type of response, (b) to stimulate different types of movements, (c) to provide a problem that minimizes the element of fear, (d) to stimulate responses that do not require great dexterity of movement, and (e) to force the S to focus upon a new aspect of movement. 4 "tools for motivation" were used: balloon, hoop, ball, and mat. Differences in creativity proved to be a function of the role of the E, whether permissive or authoritarian. It is concluded that motor creativity can be developed if the teacher permits the individual to expand his creative sense, by providing a

group situation that does not inhibit him, in a climate of security and freedom. (30 ref)—*L. A. Ostlund.*

2846. **Vurpillot, Eliane.** (U René-Descartes, Paris, France) [*Les perceptions du nourisson. (Perceptions of the infant.)*] (Fren) Paris, France: Presses Universitaires de France, 1972. 208 p.

### Cognitive & Physical Development

2847. **Amalwa, Shizuko.** [A study on Piaget's concept of conservation.] (Japn) *Japanese Journal of Educational Psychology*, 1973(Mar), Vol 21(1), 1-11.—Administered conservation tasks including substance, liquid, number, length, weight, and area to 286 kindergartners and 1st and 2nd graders. A common factor was found by the principal axis method, and 2 other factors, Weight and Area, were extracted by the varimax method in addition to the common factor. The comparison between the group given special training and a group which acquired conservation under natural conditions showed no differences in terms of the extinction rate. (English summary) (18 ref)—*S. Choe.*

2848. **Anastasiow, Nicholas J. & Hanes, Michael L.** (Indiana U, Inst for Child Study) **Cognitive development and the acquisition of language in three subcultural groups.** *Developmental Psychology*, 1974(Sep), Vol 10(5), 703-709.—Investigated the relationship between cognitive development and language acquisition by administering a sentence repetition task and a discrimination, seriation, and numeration Piagetian task to a total of 67 black inner-city, white middle-class, and white rural children. Within each subcultural group, samples were drawn from each of 3 grade levels: kindergarten, 1st grade, and 2nd grade. Results indicate that when valid reconstructions from standard English to Negro non-standard English forms were considered correct, the performance of black inner-city and white middle-class children was nonsignificantly different. However, significant differences between the 3 groups were found on function-word omission scores and Piagetian task scores. Analyses of covariance were performed using Piagetian task scores as the covariate and function word omission scores as the dependent variable. Results support D. I. Slobin's (1973) proposition that the acquisition of semantic notions in language is predictable from cognitive development. (19 ref)—*Journal abstract.*

2849. **Arai, Kunihiro.** (Tokyo U of Education, Japan) [Development of number and its relation to judgment of length.] (Japn) *Japanese Journal of Educational Psychology*, 1973(Jun), Vol 21(2), 102-110.—Observed performance of 6 tasks by 100 children: counting objects, taking out a given number of objects, comparing 2 number words, conservation of numbers and of length, and comparing lengths. Results confirm previous findings that judgment of length is contingent on conservation of numbers, that judgment of length is influenced by the number of segments (positively when the length of segments is equal and negatively when it is unequal), and that conservation of volume also depends on conservation of numbers. (English summary)—*S. Choe.*

2850. **Baron, Jonathan.** (McMaster U, Hamilton, Ontario, Canada) **Semantic components and conceptual development.** *Cognition*, 1973, Vol 2(3), 299-317.—Notes that several phenomena in the acquisition of word

meanings may be accounted for by a theory of component-by-component acquisition, a mechanism analogous to that proposed for phonological development. It is suggested that by defining a concept as an habitual plan, and a component as a subplan, this theory may be extended to acquisition of concepts in general. This theory may be applied to logical concepts, physical reasoning, moral reasoning, and verbal concepts. The ideas of component-by-component acquisition and of transfer of learning between concepts which share components provide an alternative to developmental stage theories. (French summary) (55 ref)—*Journal abstract.*

2851. **Brainerd, Charles J. & Kaszor, Peter.** (U Alberta, Edmonton, Canada) **An analysis of two proposed sources of children's class inclusion errors.** *Developmental Psychology*, 1974(Sep), Vol 10(5), 633-643.—Examined the perceptual set and misinterpretation hypotheses about children's errors on the class inclusion problem in 2 experiments. 2 previously reported lines of evidence support the perceptual set hypothesis: J. F. Wohlwill's (see PA, Vol 42:13496) verbal facilitation effect and P. R. Ahr and J. Youniss's (see PA, Vol 44:8177) relative size of subclass effect. Wohlwill's verbal facilitation effect could not be replicated in either experiment. Ss were a total of 240 1st, 2nd, and 3rd graders in 3 Canadian public schools located in middle-class areas. Findings show Ahr and Youniss's relative size of subclasses effect to be a result of a false agreement between difference questions and stimulus arrays in which the 2 subclasses contain the same number of elements rather than from either a perceptual set or question misinterpretation. Concerning the misinterpretation hypothesis, an analysis of the present Ss' ability to recall the E's questions does not provide any support for this hypothesis. Misinterpretations of the E's questions proved rare, and the correctness of children's class inclusion judgments was found to be independent of the correctness of their recall of the E's questions. (15 ref)—*Journal abstract.*

2852. **Brainerd, Charles J.** (U Alberta, Edmonton, Canada) **Neo-Piagetian training experiments revisited: Is there any support for the cognitive-developmental stage hypothesis?** *Cognition*, 1973, Vol 2(3), 349-370.—In a previous review of the literature, S. Strauss (see PA, Vol 51:6870) concluded that neo-Piagetian training experiments support Piaget's hypothesis that mental growth is a stage-like process. It is argued that Strauss's choice of data to review was very selective. Analysis of other neo-Piagetian training data reveals no support for Strauss's conclusion. (102 ref)

2853. **Day, David E.** (U Massachusetts, Amherst) **Language instruction for young children: What ten years of confusion has taught us.** *Interchange*, 1974, Vol 5(1), 59-72.—Discusses 3 major ideas. (a) Nonstandard English is neither primitive nor deficient. To assert that it is contributes to racism, elitism, and ethnocentrism, and to try to correct it is a waste of time. (b) Language behavior matures in much the same way as other human behaviors, and teachers should pay close attention to the process of language development. (c) Language and thought are closely interrelated, and oral language

instruction should focus on that relationship. (55 ref)

—H. E. Yaker.

2854. Dupuy, Harold J. (US Dept of Health, Education & Welfare, Health Resources Administration, Rockville, MD) **The rationale, development, and standardization of a basic word vocabulary test.** *Vital & Health Statistics, Series 2*, 1974(Apr), No 60, 71 p. —Describes the conceptual representation of a basic word and the development of a test to measure the acquisition of an American-English basic word vocabulary. A test constructed from a 1% sample of basic words and administered to over 3,000 1st–12th graders indicates that there is an orderly acquisition of an increasing stock of basic words with increasing age and grade. Correlational, validity, and reliability data are presented. (23 ref)

2855. Esrov, Linda V.; Hall, James W. & LaFaver, Diane K. (Northwestern U) **Preschoolers' conceptual and acoustic encoding as evidenced by release from PI.** *Bulletin of the Psychonomic Society*, 1974(Aug), Vol 4(2-A), 89–90. —Results of 2 experiments with a total of 130 3–5 yr olds demonstrate the feasibility of using the release from proactive interference (PI) technique with preschool children. In Exp I, release from PI was found using pictures from the same taxonomic category. Exp II demonstrated encoding based on acoustic qualities using oral presentation of common rhyming words. —*Journal abstract.*

2856. Farray, Rubén. ("Pedro Henriquez Ureña" National U, Santo Domingo, Dominican Republic) **[Intradimensional and extradimensional shifts in learning of classification principles: A developmental study.]** (Fren) *Psychologica Belgica*, 1973, Vol 13(3), 247–264. —Studied intra- and extradimensional conceptual shifts with the same and different materials in Ss of both sexes aged 5, 7, 11, 15, and 22 yrs old. Each age group contained 64 Ss, half of Belgian and half of Dominican nationality. From ages 7–22 yrs intradimensional shifts were learned faster. However, in 5-yr-olds intradimensional shifts and extradimensional shifts with different material were learned faster than extradimensional shifts with the same material. Results are interpreted as consistent with a mediational learning theory. (English abstract) (25 ref)—S. Slak.

2857. Feigenbaum, Kenneth. (Antioch Coll, Human Ecology Ctr, Washington-Baltimore Campus) **A study of the relationship between physical transitivity and social transitivity.** *Genetic Psychology Monographs*, 1974(Aug), Vol 90(1), 3–42. —Determined the relationship between concrete transitivity using physical concepts (e.g., lengths of sticks) and social transitivity using social concepts (e.g., the perception of happiness) in 2 experiments. 45 (e.g., the perception of happiness) in 2 experiments. 45 kindergartners, 23 1st graders, and 44 3rd graders served as Ss in Exp I, and 84 kindergartners were Ss in Exp II. In Exp I, half of the Ss were tested for transitivity with colored sticks, and the other half performed discrimination, seriation, and transitivity tasks with photographs. Few age displaying varying degrees of happiness. Few age differences were found in the ability to perceive social and physical transitivity; however, older Ss performed the seriation task better than younger Ss. In Exp II, Ss performed both tasks with concrete objects—seriation of sticks and stick figures, transitivity of same-color sticks,

different colored sticks, and stick figures—and discrimination, seriation, and transitivity tasks with drawn faces and photographs. Transitivity tasks with fewer items were easier to solve than those with more items. Both social and concrete seriation problems produced errors. Findings are discussed in relation to Piaget's transitivity research and the role of optical distortion in physical transitivity. (24 ref)—*Journal abstract.*

2858. Hata, Yoshiko. [Study of the effect of verbal labeling in concept learning: II. Concept knowledge, abstraction ability and reversal-nonreversal shifts.] (Japn) *Japanese Journal of Educational Psychology*, 1973(Jun), Vol 21(2), 116–121. —Conducted 2 experiments on labeling. Exp I involved 2 dimensions, animal and plant, and 2 values, bird and fish for the positive, and flower and tree for the negative. 144 1st graders learned to label concepts of both the values. Labeling facilitated concept identification in original, reversal shift, and nonreversal shift learning. Labeling relevant dimensional concepts facilitated original learning, and verbal ability was effective in reversal shift learning. In Exp II, 64 4th graders were selected for their ability to abstract, and 2 dimensions, square and circle, and 2 values, blue and red, of non-sense forms were used as stimuli. Labeling 2 value concepts in the initial 10 trials facilitated identification of 2 dimensional concepts in original learning, but not in shift learning.—S. Choe.

2859. Higashi, Toshiko; Tanaka, Hisako & Tsuchiya, Kazuko. (Japan Women's U, Tokyo) **[The cognitive development of sex role.]** (Japn) *Japanese Journal of Educational Psychology*, 1973(Mar), Vol 21(1), 48–53. —Studied sex role identification as cognitive development. 1,362 elementary and middle school children responded to a 22-item questionnaire concerning sex characteristics. Results indicate that sequential development in the cognition of sex role takes place in the order of external appearance, overt personal behavior, overt social behavior, and covert sex characteristics. (English summary)—S. Choe.

2860. Hoffman, Susan; Trabasso, Tom & Friedman, Morton. (U Florida) **Mental operations on number symbols by children.** *Memory & Cognition*, 1974(Jul), Vol 2(3), 591–595. —48 4–6 yr old children made choices among colors that had been associated with numbers. Prior to learning 4 number-color associations, pretraining on counting and ordering objects was given to half of the Ss. Associations were established by either absolute (paired associate) or relative (choice discrimination) methods, and then tests involving "more or less" questions on each of the possible 6 color pairs were given. Numerical associations were acquired best with absolute training or counting-ordering pretraining. Using the Ss' justifications for their responses, the test data were fit by W. K. Estes's (see PA, Vol 40:9575) scanning model. Young children apparently possess an ordered numerical scale, can map this scale onto other nonquantitative symbols, and can generate, compare, and make ordinal decisions using these symbols.—*Journal abstract.*

2861. Jablonski, Eugene M. (U Missouri) **Free recall in children.** *Psychological Bulletin*, 1974(Sep), Vol 81(9), 522–539. —Reviews traditional procedures and theories from adult free recall, as well as their implications for developmental free recall. Contemporary free-recall

research in children is presented, and important developmental variables are discussed. The need for a developmental theory to guide free-recall research in children is also discussed. (83 ref)—*Journal abstract*.

2862. Kewley-Port, Diane & Preston, Malcolm S. (Haskins Lab, New Haven, CT) **Early apical stop production: A voice onset time analysis.** *Journal of Phonetics*, 1974(Jul), Vol 2(3), 195-210.—Measured voice onset time (VOT) from spectrograms of apical stops produced by 3 young children acquiring American English, recorded at 12-wk intervals from 34-125 wks of age. Earlier data from children 6 mo to 4½ yrs old were also analyzed. Frequency distributions of apical stops along the VOT continuum were compared longitudinally across Ss and with distributions of adult productions of word-initial /d/ and /t/. Drawing on a physiological discussion of the control of timing between stop release and onset of vocal fold oscillation, a pattern of apical stop development is proposed. The earliest examples of stops, around 6 mo of age, had uniform distributions along the VOT continuum. Later the distributions of apical stops collapsed into an interval corresponding to that of American English /d/. The distributions for both /d/ and /t/ words were similar between the ages of 2 and 4½ yrs, but they did not correspond to those of adults. (22 ref)—*Journal abstract*.

2863. Kozrzewski, Janusz. [The level of mental development and personality traits of country and town children.] (Polh) *Roczniki Filozoficzne: Annales de Philosophie*, 1972, Vol 20(4), 33-58.—Administered tests of intelligence, perception and visual-motor coordination, and personality to groups of children. 117 Ss aged 4 mo to 15 yrs were from Karmanowice; other groups were from the country or from smaller towns. No cases of mental deficiency appeared among the Karmanowice Ss. Ss whose parents had received similar education showed little difference in intelligence regardless of where they lived. Of 47 4-10 yr old Ss, only 4 showed any defect in perception or visual-motor coordination. On the 16 Personality Factor Questionnaire, 8-12 yr old girls from Karmanowice showed lower Tension (Q<sub>1</sub>) than girls from smaller towns, and 8-12 yr old boys from Karmanowice showed higher Dominance than boys from smaller towns. Only 2 boys exhibited any behavior disorder, and no neurotic profile was discovered. (43 ref)—*English summary*.

2864. Kuhn, Deanna. (California State U, Fullerton) **Inducing development experimentally: Comments on a research program.** *Developmental Psychology*, 1974(Sep), Vol 10(5), 590-600.—The popular "training" studies, most of which have been devoted to the attempt to experimentally induce conservation in nonconserving Ss, are discussed with respect to the logic underlying the method and surrounding theoretical and methodological difficulties. The following major difficulties are discussed: (a) ambiguity as to the intent of many of the studies; (b) lack of agreement on methodological criteria for inferring change, and ambiguity in actual application of even the most stringent (Genevan) criteria; (c) a related lack of theoretical agreement as to what a conservation judgment reflects; and (d) the difficulty of inducing cognitive restructuring by means of brief interventions. It is argued that whether the intent of

conservation training studies has been to elucidate Piaget's view of conservation attainment or to refute it, results have been similarly ambiguous and inconclusive, and researchers' interest in performing such studies has consequently declined. Several suggestions for modification of the training study research strategy are made. (36 ref)—*Journal abstract*.

2865. Kuo, Anna & Parsons, Jacquelynne E. (U California, Los Angeles) **Development of integration processes using ability and effort information to predict outcome.** *Developmental Psychology*, 1974(Sep), Vol 10(5), 721-732.—Conducted 3 studies to examine developmental changes in the integration of ability and effort information to predict performance. Functional measurement procedures were used to determine whether it is possible to use some simple algebraic operation (e.g., addition or multiplication) to describe the way these cues are combined. A total of 176 6-11 yr old children and 24 adults (college students) were asked to predict how many puzzles a child could put together as a function of 3 levels of ability and 3 levels of effort. Results show a developmental progression in the integration process in which an additive rule characterized the responses of the youngest children, while a multiplicative rule characterized the responses of the older children and adults. Even the youngest children were able to use both cues in forming judgments and did not center on only 1 cue as would be predicted from Piaget. Also, effort was increasingly more important than ability in predicting outcomes. (18 ref)—*Journal abstract*.

2866. Mallen, Jan & Drew, Clifford J. (U Utah) **Classification behaviors in third and sixth grade lower and middle socio-economic status school children.** *Journal of Child Psychology & Psychiatry & Allied Disciplines*, 1974(Apr), Vol 15(2), 123-131.—Compared the classificatory behaviors of low and middle socioeconomic status (SES) children in the 3rd and 6th grades of public school. 48 randomly selected students of Anglo-Saxon parentage were divided into 4 groups of 12 Ss; each group contained Ss from both grade and SES levels. Each group was exposed to an array of objects for which grouping on a conceptual, nonconceptual, or associational justification was possible. Results indicate that the school experience may serve to widen the cognitive strategy system of the lower SES child by the addition of the conceptual model. (20 ref)—*Journal summary*.

2867. McGeorge, C. (U Canterbury, Christchurch, New Zealand) **Situational variation in level of moral judgment.** *British Journal of Educational Psychology*, 1974(Jun), Vol 44(2), 116-122.—Reports of research on L. Kohlberg's (see PA, Vol 48:2982) stages of moral judgment have assumed that level generalizes across responses and that a single major factor underlies Kohlberg's research, a significant variation was found from situation to situation in the responses of 40 12-yr-old boys and 23 university students to the moral judgment interview. Factor analysis indicated 2 factors underlying responses to the interview: an empathic or role-taking factor and one involving concepts of social rules and structures. Results emphasize the need for more detailed descriptions of moral development and more detailed scoring systems.—*Journal abstract*.

2868. McGhee, Paul E. (Fels Research Inst, Yellow Springs, OH) **Cognitive mastery and children's humor.** *Psychological Bulletin*, 1974(Oct), Vol 81(10), 721-730. —Reviews theory and research dealing with cognitive aspects of children's humor. Alternate means of defining cognitive mastery are discussed, and it is suggested that a Piagetian theoretical framework may offer the most promising approach to studying the relationship between cognitive mastery and the comprehension and appreciation of humor. Special attention is given to the operation of the cognitive congruency principle in children's humor. Suggestions for future theoretical and research efforts are made. (31 ref)—*Journal abstract*.

2869. Mori, Ichio. (Osaka Teacher's Coll, Scientific Educational Research Div, Japan) [On the formation of the concept of conservation in children.] (Jpn) *Japanese Journal of Educational Psychology*, 1973(Mar), Vol 21(1), 32-42.—From a population of 165 kindergartners, 1st graders, and mentally retarded children, an experimental sample was given training in conservation of substance. Results show significant training effect ( $p < .01$ ) for the experimental Ss compared with controls. In Exp II the experimental group of kindergartners was trained in conservation of weight, volume, and atomism, with similar results. It is concluded that these concepts can be acquired by synthetic judgment, and that the sequence of acquisition of these concepts is reversible. (English summary)—S. Choe.

2870. Nakano, Yasuhiko & Kajita, Masami. (U Nagoya, Faculty of Education, Japan) [Developmental study of problem-solving processes in choice task.] (Jpn) *Japanese Journal of Educational Psychology*, 1973(Mar), Vol 21(1), 12-20.—4 groups of Ss—18 kindergartners, 23 1st graders, 35 5th graders, and 18 college students—were given 2-choice tasks under different reinforcement schedules in order to find developmental trends in shift learning. The middle age-groups were significantly slower ( $p < .01$ ,  $p < .05$ ) in learning correct responses than the others. The youngest group showed not only reward maximization, but also strong pervasive response tendency. Trend analysis demonstrated an inverted U-shaped relationship between age and correct responses. It is concluded that the younger children attended to the dominant cue set associated with reinforcement but neglected the other cues and the mutually exclusive rule between these cue sets, and that the adults and older children logically operated these cue sets and the set relation defined by set theory. (English summary)—S. Choe.

2871. Owoc, Paul J. (National Program on Early Childhood Education, St Louis, MO) **On culture and conservation once again.** *International Journal of Psychology*, 1973, Vol 8(4), 249-254.—Explored possible relationships between conservation and the 3 variables of relationships between conservation and the 3 variables of milieu, schooling, and age. Ss for a liquid conservation task were 449 Nigerians in 4 age groups (6-7, 8-9, 11-13, and over 18 yrs), some rural, some urban, some with and some without schooling, from 3 different cultural-linguistic groups widely separated geographically. As expected, conservation ability was related to age, older Ss doing better than younger. No statistically significant differences appeared between rural and urban Ss. Among younger Ss, conservation appeared in significantly more

schooled than unschooled Ss ( $p < .05$ ). In Ss over 18 yrs old the difference between schooled and unschooled Ss in conservation approached significance at the .001 level. Results re-emphasize the difference in ability between schooled and unschooled Ss and the relationship between age and conservation ability. (French summary)—E. A. Gavin.

2872. Tamakawa, Kimiyo. (Tohoku U, Faculty of Education, Sendai, Japan) [A study of the development of the thinking faculty of preschool children: About the form of the presented questions and the forming of quantity concept.] (Jpn) *Japanese Journal of Educational Psychology*, 1973(Mar), Vol 21(1), 21-31.—Employed 612 kindergartners as Ss to study the process of the shift from visual-motor thinking to visual-figurative and verbal thinking and the effect of teaching the concept of weight as continuous quantity. Results show that the shift occurred in the latter half of the 5th yr of age when Ss adopted action level and outer speech and that teaching the concept of weight through communication was effective. (English summary)

2873. Walesa, Czeslaw. [The development of decision processes: Experimental tests of children at school age.] (Poln) *Roczniki Filozoficzne: Annales de Philosophie*, 1972, Vol 20(4), 101-142.—Studied the development of decision-making processes in primary school children. Exp I involved making a decision in a risk situation, to test the process of anticipating possible events and the correct choice of alternatives. Exp II and Exp III dealt with the processes of transforming signals into plausible and definite information and reaching a final diagnosis of the situation. Responses of the Ss were characteristic of particular stages of development. Hypotheses based on the study findings are discussed. —English summary.

### Emotional & Personality Development

2874. Beech, Robert P. & Schoeppe, Aileen. (New York U) **Development of value systems in adolescents.** *Developmental Psychology*, 1974(Sep), Vol 10(5), 644-656. —Used the Rokeach Value Survey to assess the value systems of a total of 396 boys and 343 girls in Grades 5, 7, 9, and 11. The most striking result was the relative stability of the rankings over all grades, perhaps indicative of a core cultural pattern. An almost equal number of changes in instrumental values across grades were observed for both boys and girls. However, twice as many changes took place in terminal values for girls than for boys. The boys exhibited a more unitary theme of increasing achievement and the stereotyped feminine sex role. (39 ref)—*Journal abstract*.

2875. Esman, Aaron H. (Jewish Board of Guardians, New York, NY) **Transsexual identification in a three-year-old twin: A brief communication.** *Psychosocial Process*, 1970, Vol 1(2), 77-79.—Describes 3-yr-old female fraternal twins, one of whom identified herself as a boy and acted accordingly. It is suggested that this transsexual identification was a means of dealing with the fear of parental seduction.

2876. Halverson, Charles F. & Waldrop, Mary F. (NIMH, Child Research Branch, Bethesda, MD) **Relations between preschool barrier behaviors and early school-age measures of coping, imagination, and verbal**

**development.** *Developmental Psychology*, 1974(Sep), Vol 10(5), 716-720.—Assessed the contemporaneous and longitudinal relations of coping with an experimental barrier situation at 2½ yrs of age by observing barrier performance of 43 male and 31 female preschool children. Analyses indicate that effective barrier behavior was related to other measures of coping, vigorous play behavior, and lack of fear at the preschool period. A follow-up study when Ss were in the early school-age period (7½ yrs old) revealed that competence in the experimental barrier situation was related to intelligence, coping, and socially effective behaviors for both sexes. Results suggest the feasibility of using responses to experimental barrier situations to assess coping behavior. (16 ref)—*Journal abstract*.

2877. Laird, Don R.; Laosa, Luis M. & Swartz, Jon D. (Educational Service Ctr, Corpus Christi, TX) **Inkblot perception and reading achievement in children: A developmental analysis.** *British Journal of Projective Psychology & Personality Study*, 1973(Dec), Vol 18(2), 25-31.—Studied the relationship between developmental indices in the Holtzman Inkblot Technique (HIT) and reading achievement. The Metropolitan Reading Test (MRT), a subtest of the Metropolitan Achievement Test, and the HIT were administered annually for 3 yrs to 98 2nd and 4th graders. Results indicate the HIT Factor I variables previously found to relate to developmental level—Form Definiteness, Movement, Integration, and Human—relate positively to reading comprehension, as do the remaining Factor I variables—Popular and Barrier. Partialling out the effects of intelligence from both HIT and MRT scores yields similar results for all variables. Partialling out intelligence from only the HIT variables also yields similar results. Form Definiteness and Barrier relate more closely to decoding ability and accuracy of perception than to reading comprehension. Location scores related negatively to reading comprehension for females only. (18 ref)—*Journal summary*.

2878. Mitchell, Edna. (Smith Coll) **The learning of sex roles through toys and books: A woman's view.** *Young Children*, 1973(Apr), Vol 28(4), 226-231.—Describes 2 major shaping influences of young children—parental attitudes and the commercial channel of nonchoice in toys and books—as they affect the development of sex identification. The need for such elucidation is based on the assumption that all education and consciousness-raising for women is wastefully remedial as long as the early experiences of childhood are not restructured. The development of a child in accord with predetermined sexual stereotypes is detailed. The use of sex-oriented toys is noted. It is concluded that the place to begin in helping women to learn how to develop their potential without an increased and unhealthy sense of martyrdom is with young children.—R. S. Albin.

2879. Moriya, Kelko; Mori, Makiko; Hirasaki, Yoshiaki & Sakanoe, Noriko. [The development of self-cognition: School children's diaries.] (Japn) *Japanese Journal of Educational Psychology*, 1972(Dec), Vol 20(4), 205-215.—Analyzed diaries written by 11 children while they were in the 1st-5th grades. Classification of the contents in terms of how and what the children perceived of the self and of other people indicate (a) that self-concept develops in relation to other people, who are

seen as individuals in the 1st developmental sequence, as a group in the next, and as a group of which the child himself is a member in the final stage; (b) that the target of children's observation proceeds from the overt to the covert behavior of the self and others; and (c) that retrospective perception of the self begins with development of the ability to see the present self. (English summary)—S. Choe.

2880. Prendergast, P.; Zdep, S. M. & Sepulveda, P. (Girl Scouts of the USA, Washington, DC) **Self image among a national probability sample of girls.** *Child Study Journal*, 1974, Vol 4(3), 103-114.—Studied the relationship of self-image to race, social class, urbanicity, and age among a nationally representative sample of more than 1,800 9-17 yr old girls. As part of a larger personal interview, a total of 6 questions dealing with ability, appearance, and interpersonal relations were asked. Results show that on all of the items black girls rated themselves significantly higher than white girls rated themselves. There were no significant differences on the other variables. Results are discussed in terms of increasing racial pride and social defensiveness. (30 ref)—*Journal abstract*.

2881. Samuels, Shirley C. (Manhattanville Coll) **An investigation into the self-concepts of lower- and middle-class black and white kindergarten children.** *Journal of Negro Education*, 1973(Fal), Vol 42(4), 467-472.—Administered 2 child self-concept tests (Clark U-scale and Brown Test) during the 1st mo of school to 93 of 417 kindergartners, boys and girls, from white and black lower- and middle-class families in a New York City suburb. Results indicate ( $p < .05$ ) that black middle-class children had higher self-concepts than black lower-class children on both tests, while white middle-class children had higher self-concepts than white lower-class children on the Clark U-Scale only. Mother's church attendance and community group involvement were significantly related ( $p < .01$ ) to self-concept for lower-class, but not for middle-class children.—W. E. Sedlacek.

2882. Southwood, H. M. **The origin of self-awareness and ego behaviour.** *International Journal of Psycho-Analysis*, 1973, Vol 54(2), 235-239.—Describes the process by which the mother communicates with her baby. Attention is drawn to the activity of the mother in establishing eye contact with her baby from the earliest days, to her imitation of the baby's facial expressions and sounds, and her encouragement of the baby to imitate her own expressions and sounds. It is suggested that the notion that people "think in our heads" is a derivative of this early identification of one's own face and eyes with mother's. It is concluded that the concept of the origin of the ego may be based upon this early communication.—*Journal summary*.

2883. Vasishta, V. S. **Diagnosis of good adjustment amongst secondary school children.** *Association of Educational Psychologists Journal & News Letter*, 1971(Fal), Vol 2(10), 40-50.—Compared the efficacy of 7 different methods for determining "good" adjustment among English secondary school children: Cattell High School Personality Questionnaire (HSPQ), Forms A and B; Rutter Scale; Thinking About Yourself (Bower); Sociometric Questionnaire; Junior Eysenck Personality

Inventory; and Stott's Adverse Pointers Questionnaire. 20 boys and 20 girls 13½ yrs old were divided by their headmaster into 2 groups, one "random" and the other "well adjusted." Results indicate that the Rutter Scale, the HSPQ (Form B), and the Sociometric Questionnaire, combined with information on socioeconomic status, could effectively identify children with good adjustment. —I. L. Zimmerman.

### Social Behavior & Family Relations

2884. Braun-Galkowska, Maria. [Features of personality conditioning family authority.] (Poln) *Roczniki Filozoficzne: Annales de Philosophie*, 1972, Vol 20(4), 59-74.—Studied personality factors of those wishing to dominate the family structure (rather than those who actually dominated) in 60 married couples who were administered the 16 Personality Factor Questionnaire. Men who wanted to dominate were more independent and intelligent than those who tended to subordinate themselves. Women who wanted to dominate were self-confident, aggressive, and less intellectual than subordinating women. Critical and aggressive men seemed dominating to women, and critical and aggressive women seemed dominating to men. (15 ref) —English summary.

2885. Chu, Cheng-ping. (National Taiwan U, Taipei, Republic of China) Parental attitudes in relation to young children's creativity. *Acta Psychologica Taiwanica*, 1973, Vol 15, 10-24.—Investigated the relationship between parental attitudes and young children's creativity, using 18 preschoolers and their parents. Children were given 3 modified creativity tests measuring fluency and originality. Parents completed the Parental Attitude Research Instrument (PARI). No unidimensional characteristics were found among the 3 creativity tests, indicating that to use a combined total creativity score is not appropriate. The assessment of PARI indicates that it is a worthy instrument which is sensitive to various factors. Some significant correlations were found between parental attitudes and children's creativity (e.g., mother's authoritarian score was related to child's picture-fluency, and father's equalitarian score was related to child's originality). Mother and father had different effects on their child because of sex differences. (46 ref)—Journal abstract.

2886. Deutsch, Francine. (Pennsylvania State U) Female preschoolers' perceptions of affective responses and interpersonal behavior in videotaped episodes. *Developmental Psychology*, 1974(Sep), Vol 10(5), 733-740.—Constructed an empathy measure to test whether 3- and 4-yr-old children can perceive affective states as indicated by H. Borke (see PA, Vol 47:686). 8 filmed episodes had congruous and incongruous stimulus features—4 episodes represented incongruity and 4 represented parallel congruous episodes where positive or negative affect was matched to the appropriate positive or negative interpersonal behavior. 48 female 2-5 yr old preschoolers were divided into high and average mental age groups and were asked to tell the story about each episode. Findings reveal that on the congruous episodes, there was a significant main effect of Mental Age for reasons for affective responses, for affective responses, and for intrapersonal behavior;

however, this main effect was only significant for the latter 2 measures on incongruous episodes. Ss scored significantly higher on the congruous than on the incongruous episodes. There was no significant main effect of Chronological Age for any measure. (22 ref) —Journal abstract.

2887. Deutsch, Francine. (Pennsylvania State U) Observational and sociometric measures of peer popularity and their relationship to egocentric communication in female preschoolers. *Developmental Psychology*, 1974(Sep), Vol 10(5), 745-747.—Tested the relationship between popularity and communicative egocentrism with female preschoolers, and assessed the relationship between communicative egocentrism and 2 popularity measures: (a) a realistic measure of actual classroom interaction and (b) a sociometric measure of preferred playmates. Ss were 60 white middle-class 3-5 yr old female preschoolers. Results indicate that communicative egocentrism was significantly related to the observational measure of peer popularity even when the common effect of IQ was removed. Communicative egocentrism, however, was not significantly related to the sociometric measure of popularity. The possibility of a curvilinear relationship existing between communicative egocentrism and a sociometric measure of popularity is advanced.—Journal abstract.

2888. Flavell, J. H. (U Minnesota, Inst of Child Development) The development of inferences about others. In T. Mischel (Ed), *Understanding other persons*. Totowa, NJ: Rowman and Littlefield, 1974. xv, 266 p.—Describes recent ideas and research findings on the developmental aspects of social cognition, in particular the child's ability to endow others with inner psychological properties. 2 qualitative models of phenomena in this area are discussed: (a) an information-processing characterization of 4 classes of knowledge used to make inferences about another's inner properties and (b) an ability to represent and predict the visual acts and experiences of another. (4 p ref)

2889. Harré, R. (Oxford U, England) Some remarks on "rule" as a scientific concept. In T. Mischel (Ed), *Understanding other persons*. Totowa, NJ: Rowman and Littlefield, 1974. xv, 266 p.—Proposes that there are no natural forces in men that lead automatically to the formation of a society, but that human social behavior is the cultural phenomenon of an intellectual response of a self-aware species to the problems of living. The concepts of "rule" and "rule following" are treated as tools for the analysis of human behavior, and psychology is polarized around the "old" paradigm—that a human being be treated for scientific purposes as an automaton—and the "new" paradigm—that a human being be treated as a plan-making, self-monitoring, goal-generating agent. (30 ref)

2890. Hendrickson, Norejane J. & Warchol, Barbara. (Florida State U) Young children's social maturity and their drawings. *Child Study Journal*, 1974, Vol 4(3), 115-123.—Tested V. Lowenfeld's (1957) idea that there is a relationship between a child's ability to participate in social situations and his drawing expressions. A sociometric technique developed by B. R. McCandless and H. R. Marshall (see PA, Vol 33:1032) was used to test 16 4- and 5-yr-old children. M. Parten's (1943) time-sample

observation method was modified to rate the Ss' social participation. Also, 5 selected drawings were obtained from each S to test Lowenfeld's idea. Results indicate that the Ss' drawings were not appropriate indicators of their social maturity.—*Journal abstract.*

2891. Michel, Andrée. (National Ctr for Scientific Research, Paris, France) [Masculine and feminine roles in the family: Examination of the classic theory.] (Fren) *Social Science Information*, 1971(Feb), Vol 10(1), 113-135.—Tested M. Zelditch's hypothesis that role specialization and differentiation are essential to the integration and stability of the familial system. In 46 of 56 societies studied, the male role was that of breadwinner-instrumental leader and the female role was that of housewife-expressive leader. 4 related hypotheses were tested in 450 French families by measuring 5 variables—wife's satisfaction, accord, communication, fulfillment plans and objectives, and realization of planned number of children. Results did not support the hypothesis. Role differentiation and specialization inhibited integration and functioning in these families. Role equality for all 5 variables produced more positive effects. Only in the area of fulfillment of plans and objectives was there any evidence that role specialization (i.e., the wife being solely responsible for the housework or specialization of roles in domestic matters) might have a positive effect.—*R. J. Anderson.*

2892. Oliver, Lincoln I. Parent ratings of behavioral patterns of youths 12-17 years: United States. *Vital and Health Statistics, Series 11*, 1974(May), No 137, 59 p.—Presents a descriptive analysis of the opinions of US parents regarding the general health, peer relations, mental development, and emotional health of their adolescent offspring—a representative sample of 6,768 youths 12-17 yrs old examined between 1966 and 1970 in the Health Examination Survey of the National Center for Health Statistics. Findings are reported by age and sex of the youth. Parental opinions of their children were in general favorable by a ratio of 6 to 1, although unfavorable responses were expressed about some aspects of behavior and development (i.e., children's tendency to exaggerate illness; existence of health problems; ability to make friends; reactions to entering 1st grade; and difficulties involved in their upbringing. (17 ref)—*Journal summary.*

2893. Secord, Paul F. & Peevers, Barbara H. (Queens Coll, City U New York) The development and attribution of person concepts. In T. Mischel (Ed), *Understanding other persons*. Totowa, NJ: Rowman and Littlefield, 1974. xv, 266 p.—Considers the basic question of the nature of the person and of the self and examines, with reference to the attribution of person concepts, how people are conceptualized as individuals, how they are represented verbally, and how the conception of them relates to the observer and to the setting in which they are known. Actual descriptions of discrete actions are analyzed from a developmental point of view to determine the bearing they have on person-concept attribution.

2894. Steininger, Marion & Lesser, Harvey. (Rutgers State U, Camden) Sex and generation differences and

similarities in social attitudes. *Journal of Counseling Psychology*, 1974, Vol 21(5), 459-460.—79 male and 89 female college students and their parents (108 fathers and 138 mothers) responded to items dealing with social issues. Parents were more conservative on 21 of the 24 items, significantly so on 13. Sex differences were significant for 7 items and were interpreted in terms of self-serving attitudes and the tender-tough dimension. The generation gap was greatest for items closest to the daily lives of the respondents and may be both an expression of and a contributor to social change.—*Journal abstract.*

2895. Wynne, Edward. (U Illinois, Chicago Circle) Socialization to adulthood: Different concepts, different policies. *Interchange*, 1974, Vol 5(1), 23-35.—Analyzes some of the socialization problems faced by children from families earning \$15,000 or more a year where one or both parents have had higher education. To become effective adults, children must learn both cognitive and affective skills, but there is evidence that these skills are not learned. Several long-range research and development proposals are discussed as remedies for these socialization problems. Such proposals require major revisions in school and college policies. They also depend on involving a greater variety of persons and institutions in the socialization process. (60 ref)—*H. E. Yaker.*

2896. Zoberman, Nicole. (INRDP Ctr de Recherche de l'Education Spécialisée et de l'Adaptation Scolaire, Paris, France) [Parents' expectations vis-a-vis nursery school.] (Fren) *Cahiers de Psychologie*, 1972, Vol 15(3-4), 239-246.—Studied whether parents' expectations of nursery school vary with social background as determined by the father's occupation. 2 classes of 22 pairs of parents of 5-6 yr old nursery school children were interviewed. Parents in the skilled workman class expected primarily an initiation in academic skills, whereas the middle-class-executive parents looked for the social and individual development of the child. (English summary)

### Adult Development & Aging

2897. Clemente, Frank & Sauer, William J. Race and morale of the urban aged. *Gerontologist*, 1974(Aug), Vol 14(4), 342-344.—Analyzed racial differences in morale for comparable samples of 721 black and 211 white residents of Philadelphia age 65 and over, using the Philadelphia Geriatric Center Morale Scale. An hypothesis suggesting blacks have lower morale than whites was derived from the literature and tested by regression analysis. The standardized partial regression coefficient was of negligible magnitude, and the hypothesis was rejected. Possible reasons for the failure of race to emerge as even a moderate predictor of morale include M. Messer's (1968) argument that elderly blacks view old age as a reward in itself and J. D. McCarthy and W. L. Yancey's (1971) contention that presumed racial differences in morale have received little actual empirical support. (28 ref)—*Journal abstract.*

2898. Hoppa, Mary E. & Roberts, Gary D. (Snohomish County Mental Health Services, Everett, WA) Implications of the activity factor. *Gerontologist*, 1974(Aug), Vol

14(4), 331-335.—Compared a total of 1,014 Senior Center attenders and nonattenders from 1 county who completed a modified version of the Social Needs Indicator Questionnaire. The type of activity was found to be a major factor in determining frequency of senior citizen needs. One implication is that service provision to senior citizens should not be totally of the "keep them occupied" variety but, as with all persons, it should allow for the type of activity which gives a feeling of usefulness, of a contribution to society, and of fulfillment to the individual.—*Journal abstract*.

2899. Schaie, K. Warner & Parham, Iris A. (U Southern California, Ethel Percy Andrus Gerontology Ctr) **Social responsibility in adulthood: Ontogenetic and sociocultural change.** *Journal of Personality & Social Psychology*, 1974(Oct), Vol 30(4), 483-492.—Reports responses on a questionnaire scale of social responsibility over a 14-yr period for 161 Ss aged 21-84 yrs. Similar analyses were also made based on 3 independent random samples ( $N = 2,151$ ). Repeated measurement and independent random-sampling data were examined for changes occurring over the 2 7-yr periods 1956-1963 and 1963-1970. Comparisons were made for Ss retested and for those who left the sample panels (dropout effects). Results suggest that there are no stable ontogenetic patterns in the adult life course of reported social responsibility. Rather, evidence indicates an overall trend of reduced social responsibility over the period monitored but with specific patterns depending upon sex and generation membership. (39 ref)—*Journal abstract*.

2900. Thorson, James A.; Whatley, Lynda & Hancock, Karen. (Georgia Ctr for Continuing Education, Atlanta) **Attitudes toward the aged as a function of age and education.** *Gerontologist*, 1974(Aug), Vol 14(4), 316-318.—59 practitioners in service delivery to the aged and 61 graduate and undergraduate students completed Kogan's Attitudes Toward Old People scale as part of a continuing study. Results were compared in terms of Ss' age (from under 25 to over 55 yrs) and education (less than Grade 8 to graduate school). It was determined that younger and better-educated Ss had significantly more positive attitudes toward the aged than did those who had fewer years of education and were themselves older. Possible reasons for these differences in attitude are that the older Ss had given more thought to the negative aspects of aging, and those with less education may have had a different image of old age than the better-educated group.—*Journal abstract*.

2901. Woodward, Harriette; Gingles, Ruby & Woodward, John C. **Loneliness and the elderly as related to housing.** *Gerontologist*, 1974(Aug), Vol 14(4), 349-351.—Demonstrates that the degree of happiness and contentment with housing and not the type is the determining factor in feelings of loneliness among the elderly. A random sample of 390 older persons living in apartments, housing complexes, relatives' or friends' homes, and their own homes were interviewed concerning loneliness. These findings suggest that there are a number of housing possibilities for the elderly, and the type of housing is probably not the most important consideration.—*Journal abstract*.

## CULTURAL INFLUENCES AND SOCIAL ISSUES

2902. Quen, Jacques M. (Cornell U, Medical School, NY) **Anglo-American criminal insanity: An historical perspective.** *Journal of the History of the Behavioral Sciences*, 1974(Jul), Vol 10(3), 313-323.—Examines the history of Anglo-American laws concerning the criminal responsibilities of the insane. It is concluded that legal and social attitudes are characterized by "a resonance between the wish to punish and the wish to protect and treat."

### Culture & Ethnology & Race Relations & Religion

2903. Abbott, Simon. (Inst of Race Relations, London, England) **Race studies in Britain.** *Social Science Information*, 1971(Feb), Vol 10(1), 91-101.

2904. Bowd, Alan D. (U Manitoba, Winnipeg, Canada) **Practical abilities of Indians and Eskimos.** *Canadian Psychologist*, 1974(Jul), Vol 15(3), 281-290.—Reviews literature concerning the practical abilities of American Indians and Eskimos. The review traces the development from a concern with assumed racial differences before World War II, to an examination of environmental correlates of abilities and methodological issues in the postwar period. The comparative strengths of native peoples' spatial, perceptual, and mechanical skills are related to contemporary developments in research and the need for educational change. Significant aspects of current research are considered to be (a) a growing emphasis on the study of practical abilities within a more holistic theoretical framework and (b) an increased awareness of cultural diversity among native populations. (French abstract) (47 ref)—*Journal abstract*.

2905. Chu, Cheng-Ping & Ryback, David. (National Taiwan U, Taipei, Republic of China) **Child-rearing practices in the Republic of China: A cross-cultural comparison.** *Acta Psychologica Taiwanica*, 1973, Vol 15, 6-9.—To compare child-rearing practices among some Asian countries, a 28-item questionnaire covering such areas as psychological security, feeding, weaning, toilet training, and socialization was administered to 167 Chinese students at National Taiwan University. Ss were asked to respond based on their general ideas about child-rearing practices and the experiences of their own homes. A chi-square analysis of comparisons with data obtained previously from Ethiopian and Thai students indicated many significant differences among the 3 cultures (e.g., Chinese mothers were closest to their infants but least sensitive to their needs, whereas Ethiopian parents were most responsive to children's cries but least able to make them feel secure).—*Journal abstract*.

2906. Crawford, Thomas J. (U California, Berkeley) **Sermons on racial tolerance and the parish neighborhood context.** *Journal of Applied Social Psychology*, 1974(Jan-Mar), Vol 4(1), 1-23.—Conducted a study of the racial attitudes of a group of white, Roman Catholic residents of a large midwestern city. 328 parishioners were interviewed before and after they heard 2 sermons opposing racial injustice and segregation. Results indicate that there was no significant relationship between pre- and postsermon change in a parishioner's attitude

toward racial integration and the prointegration intensity of the sermons he heard. However, variation in the prointegration intensity of sermons delivered was closely related to the socioeconomic status of the parishioners, suggesting that the priests' perception of parish norms may have influenced the contents of the sermon. The needs or functions that segregationist attitudes may serve were considered. The 3 strongest of 14 correlates of segregationist attitudes investigated were (a) belief that racial integration leads to neighborhood deterioration, (b) authoritarian aggression, and (c) perception of neighbors' attitudes toward integration. These 3 correlates appear to reflect object appraisal needs, externalization of inner conflict needs, and social adjustment needs, respectively. (20 ref)—*Journal abstract*.

2907. Croghan, Leo M. (Washington U) **A question of freedom.** *Journal of Religion & Health*, 1974(Jul), Vol 13(3), 201-206.—Presents a plea by a psychologist and ex-priest for reconsideration of the dogma of celibacy. Celibacy is viewed as a denial of human rights and freedom of choice. Reasons for a married priesthood are enumerated and discussed. Unmarried priests cannot participate effectively in civil rights issues since they have nothing to lose. They own no property and have no family or children, yet they propose to lead in neighborhood integration. Actions taken on celibacy by the Roman Catholic church are reviewed and a number of spokesmen are cited on the issue. The loneliness and occasional homosexuality found in the priesthood are considered. The "love of a man for a woman" is described as "the finest human expression of total caring." It is argued that church leaders who have stated that "we live in a world of change" must themselves show willingness to change in response to the increasing opposition to celibacy as a universal requirement for the priesthood.—*F. Hardt*.

2908. Derogowski, Jan B.; Ellis, Hadyn D. & Shepherd, John W. (U Aberdeen, Scotland) **A cross-cultural study of recognition of pictures of faces and cups.** *International Journal of Psychology*, 1973, Vol 8(4), 269-273.—Hypothesized that Africans would be more likely than Caucasians to recognize faces more easily than domestic objects. Ss were 12 male Rhodesians 20-45 yrs old, 12 Rhodesian females 19-38 yrs old, 12 Caucasian males 15-17 yrs old, and 12 Caucasian females 14-16 yrs old. The stimuli consisted of 3 sets of photographs, showing (a) cups and mugs, (b) Western and African male faces, and (c) Western and African female faces. Each S saw half of each set, with instructions to observe them carefully to be able to recognize them the next day; Caucasians were shown Western faces and Africans were shown Negro faces. 24 hrs later Ss were shown all the pictures in each set and asked to identify the ones that they had seen before. The hypothesis was not supported; only 1 set of scores showed a significant difference by race. Women recognized cups more often than they recognized faces. (French summary) (19 ref)—*E. A. Gavin*.

2909. Dunn, Joe R. & Lupfer, Michael. (Wesley Coll) **A comparison of black and white boys' performance in self-paced and reactive sports activities.** *Journal of Applied Social Psychology*, 1974(Jan-Mar), Vol 4(1), 34-35.—Tested M. Worthy and A. Markle's thesis (see

PA, Vol 45:4035) that whites excel at self-paced and blacks at reactive sports activities, by assessing the performance of 55 white and 122 black 4th-grade boys playing a modified soccer game. The research also explored the relationships between several dimensions of socialization (e.g., father presence-absence) and relative performance on the self-paced-reactive dimension. 2 significant correlations emerged: regardless of their own racial identity, boys who excelled at the self-paced activity tended to have several younger siblings and to attend schools with a sizeable representation of white students. Subsequent interviews revealed that black and white boys did not differ in their preference for self-paced and reactive sports activities. *Journal abstract*.

2910. Fortes, Meyer. (U Cambridge, England) **The first born.** *Journal of Child Psychology & Psychiatry & Allied Disciplines*, 1974(Apr), Vol 15(2), 81-104.—Examines the role of the firstborn in the cycle of generations. The relationship of firstborns with parents, siblings, and the larger community is illustrated through a description of tribal and oriental cultures in general, and Tallensi, an African tribe, in particular. A review of ethnological data indicates that the advent of parenthood is experienced or at least customarily defined among many peoples as a life-stage fraught with conflict. The fulfillment and the promise of immortality it signifies is contrasted with the threat to the parent's vitality and potency it foreshadows. Thus, parenthood at once evokes the protective and tender impulses that will ensure the growth and survival of the offspring and sometimes stirs up impulses of hostility and resentment against its creator—the first-born. (61 ref)—*M. E. Pounsel*.

2911. Greenfield, Patricia M. (U California, Los Angeles) **Comparing dimensional categorization in natural and artificial contexts: A developmental study among the Zinacantecos of Mexico.** *Journal of Social Psychology*, 1974(Aug), Vol 93(2), 157-171.—Studied cognitive processes among the Zinacantecos of Southern Mexico, focusing on the role of familiarity and cultural relevance in the development of categorization behavior. Results show that the ability to use verbal concepts in sorting and resorting an array of objects developed with age in both schooled and unschooled Zinacantecos. No aspect of sorting behavior showed a positive effect of familiarity of object domain. On the contrary, grouping and regrouping familiar objects (flowers) by color sometimes was done more poorly than grouping and regrouping unfamiliar objects (rods) because of the irrelevance of the color dimension to flower bouquets in the context of Zinacanteco culture. Although the species dimension was relevant to categorizing the culturally familiar flowers, its use as a basis for grouping developed after all other dimensions—color length, and circumference—probably because of its multidimensional perceptual qualities.—*Journal abstract*.

2912. Hilliard, Asa G. (San Francisco State Coll) **A helping experience in African education: Implications for cross-cultural work.** *Journal of Non-White Concerns in Personnel and Guidance*, 1974(Apr), Vol 2(3), 133-144.—Describes the 10-yr Monrovia Consolidated School System experimental project, which was begun by Liberian and American education planners as a means of improving the quality of education in Liberia's capital

city. The application of many of the principles in the Monrovia project to cross-cultural work in the US, particularly the consultant's role, is suggested.

2913. Hines, George H. (Victoria U Wellington, New Zealand) **The persistence of Greek achievement motivation across time and culture.** *International Journal of Psychology*, 1973, Vol 8(4), 285-288.—Conducted validation studies that showed significant correlation between the Thematic Apperception Test and the Lynn Questionnaire (LQ). The LQ was then administered, in the English or Greek form as appropriate, to 5 groups of Ss: (a) 55 Greeks living in Greece, (b) 38 Ss of Greek birth or parentage living in the US, (c) 26 Ss of Greek birth or parentage living in New Zealand, (d) 77 non-Greeks in the US, and (e) 287 non-Greeks in New Zealand. No statistically significant differences in achievement motivation appeared for any groups of Greek family origin. Greeks born in Greece but living in the US showed significantly higher achievement motivation levels ( $p < .01$ ) than non-Greek Americans, but Greeks born in the US did not. Greeks in New Zealand, whether born there or in Greece, showed significantly higher achievement motivation levels ( $p < .01$ ) than non-Greek New Zealanders. Results confirm the persistence of achievement motivation across generations and cultures. (French summary) (17 ref)—E. A. Gavin.

2914. Huang, Lily C. & Harris, Mary B. (Lake Superior Research Coll) **Altruism and imitation in Chinese and Americans: A cross-cultural experiment.** *Journal of Social Psychology*, 1974(Aug), Vol 93(2), 193-195.—Conducted a field experiment with 130 Chinese in Taipei, Taiwan, and 115 Americans in Albuquerque, New Mexico, to determine the effects of observing a model on accepting and actually mailing a letter. It was predicted that Chinese, being more conformist, would help less than more "materialistic" Americans in the refusing model and helpful rewarded model conditions, and more in the no model and helpful unrewarded model conditions. However, the only statistically significant difference found was that a higher percentage of letters accepted by Chinese Ss were actually received.—*Journal abstract*.

2915. Krishnan, L. (Government New Girl's Degree Coll, India) **Attitude structure and change: An experimental study.** *Psychologia: An International Journal of Psychology in the Orient*, 1974(Mar), Vol 17(1), 6-15.—Measured attitudes toward religion (taken in the broadest sense). Included were valences of religious attitude, congruence-incongruence of attitude change, and sex differences in relation to these 2 factors. 3 hypotheses were tested. Ss were 110 16-22 yr old undergraduates, most of whom were Hindus. A Likert-type religious attitude scale was used. On the basis of scores obtained, Ss were classified into 6 valence groups. Results indicate that positivist males were significantly more likely to change than negativist males and that males and females were equally likely to change. (21 ref)—R. D. Nance.

2916. Lefebvre, André (Tien Educational Ctr, Taipei, Taiwan, Republic of China) **Self-concept of American Negro and white children.** *Acta Psychologica Taiwanica*, 1973, Vol 15, 25-30.—Hypothesized that urban black children have a lower self-concept than their white

counterparts. 40 black male 7th and 8th graders from an all-black parochial school and 40 white male 7th and 8th graders from an all-white parochial school were matched in terms of age, IQ, and socioeconomic status. Both groups were administered the Tennessee Self Concept Scale. Blacks scored significantly lower than whites on total scores and the following scales: Behavior, Physical Self, Personal Self, Moral-Ethical Self, Identity, and Self-Satisfaction. Scores on the other subscales were all in the expected direction.—*Journal abstract*.

2917. MacArthur, Russell. (U Alberta, Edmonton, Canada) **Some ability patterns: Central Eskimos and Nsenga Africans.** *International Journal of Psychology*, 1973, Vol 8(4), 239-247.—Administered various tests of cognitive ability to 2 groups of young students—65 Central Eskimos and 65 Nsenga Africans—as part of a large multicultural study of relationships between aptitude and environment. After normalizing most scores, principal factor analyses of the ability intercorrelations (for each sample separately) were followed by varimax and oblique higher-order promax rotation. For Eskimo Ss 8 1st-order factors accounted for 77% of the total variance; for Nsenga Ss, 7 factors accounted for 73% of the total variance. The factors for each sample correlated highly. While coefficients of congruence for Eskimos with Nsengas showed resemblance between the 2 samples, the factors were the same. Striking resemblance of 3rd-order factors to each other and to the 1st unrotated principal factor appeared. Results support extension of H. A. Witkin's differentiation theory. The Canadian Eskimos' hunting ecology and independence training appears to foster a broad spatial-field independence cluster of abilities and a distinctive cluster involving inductive reasoning from nonverbal stimuli. Agricultural ecology and socialization, tending toward conformity and obedience in Nsenga culture, goes with test results that show inductive reasoning task results merging with those of verbal and educational task results. (French summary) (26 ref)—E. A. Gavin.

2918. McMillen, David L. (Mississippi State U) **Confidence in stereotypes concerning ethnic groups.** *Journal of Social Psychology*, 1974(Aug), Vol 93(2), 203-210.—To determine confidence in the accuracy of stereotypes, male Negro and Caucasian stimulus persons were presented to 60 male undergraduates. Half of the Ss were told that the E possessed an independent check on the accuracy of perceptions. The remaining half were not informed of an independent check. Significant differences in ratings of Negro and Caucasian stimulus persons occurred only when Ss thought no independent check was available. Findings suggest that Ss were not confident in the validity of their stereotyped view of Negroes.—*Journal abstract*.

2919. Meade, Robert D. & Brislin, Richard W. (Western Washington State Coll, Ctr for Cross-Cultural Research) **Controls in cross-cultural experimentation.** *International Journal of Psychology*, 1973, Vol 8(4), 231-238.—Points out that cross-cultural research is like other psychological research in the 3 categories of controls that it considers. With respect to stimulus or independent variables, comparability must be insured. Control of S variables calls for randomness of selection or for a particular state in the Ss under investigation.

Measurement or recording of the dependent variable requires taking into account possible constant errors and random errors. Cross-cultural research also has special problems of its own; e.g., persons in non-Western cultures do not always perceive as persons in Western cultures do, and at times it is not certain whether they are attending to the stimulus intended for them. Attention to previous learning, to sequential effects, to artificiality of the situation, and to special demand characteristics within one culture that are not found in others, provides challenge at the locus of the S. Since the same behavior may mean quite different things in different cultures, deciding which responses will be measured, and how, creates further problems for cross-cultural research. (French summary) (20 ref)—*E. A. Gavin.*

2920. **Miller, Louis.** (Ministry of Health, Jerusalem, Israel) **The special needs of minority groups.** *Israel Annals of Psychiatry & Related Disciplines*, 1972(Dec), Vol 10(4), 305-310.—Views a minority as a group which is smaller in size and has less power than the majority, and which has a rooted sense of its own identity and of being different. Clashes between majority and minority groups frequently result from threats to identity feelings. 2 principles which result in sociocultural change and homogeneity are presented: (a) there is a primitive drive toward cultural homogeneity which results in intraspecies aggressive attempts either to assimilate or to destroy anyone who is different and (b) all cultures are moving toward a common identity as a result of technological progress and change. The effect of these principles on the minority is discussed, and directions for mental health action with minorities are outlined.—*Journal abstract.*

2921. **Nussbaum, Kurt.** (Johns Hopkins U, Medical School) **Abnormal mental phenomena in the prophets.** *Journal of Religion & Health*, 1974(Jul), Vol 13(3), 194-200.—Discusses 3 borderline states between the normal and the abnormal: inspiration, ecstasy, and eidetic imagery. Inspiration is a state of excitement showing well preserved reality control. In ecstasy, perception of reality disappears and an episode of "psychotic paralysis" for one or more prominent ideas occurs. Eidetic imagery involves visions, dreams, and tactile or auditory experiences. Examples from the Old Testament of each of these types of behavior are given. Hallucination and revelation are contrasted and compared, the place of guilt in the prophets' calling considered, and schizoid withdrawal from the community analyzed. The contagion of frenzy is interpreted. Purposeful and useless prophesying are illustrated from Old Testament passages. Mania, paranoia, and depression found in some of the "great" or literary prophets are semantically investigated. It is also argued that valuable insights and guidance might be obtained from a psychotic state.—*F. Hardt.*

2922. **Orpen, Christopher.** (U Cape Town, South Africa) **Discrimination, work attitudes, and job satisfaction: A comparative study of whites and Coloureds in South Africa.** *International Review of Applied Psychology*, 1974(Apr), Vol 23(1), 33-45.—Compared work and needs satisfaction of 72 employed white and 62 employed Coloured (racially mixed) clerks in a situation where the latter were a minority subject to discrimina-

tion. Instruments used were Porter's (1963) work attitudes questionnaire, the Brayfield-Rothe (1951) index of job satisfaction, and a 7-point self-rating measure of overall job satisfaction and the extent to which Ss felt discriminated against by society in general. Results indicate that a conceptualization of job satisfaction which does not explicitly indicate recognition of the part played by the worker's frame of reference is inadequate. Serious doubts are raised concerning the validity of the implications of the need-fulfillment and 2-factor theories of job satisfaction. (33 ref)—*L. A. Ostlund.*

2923. **Servadio, Emilio.** (Psychoanalytic Ctr, Rome, Italy) **Peasant healers and the paranormal.** *Parapsychology Review*, 1974(Jul-Aug), Vol 5(4), 12-15.—Discusses an investigation of Lucania, a superstitious and economically backward area of southern Italy. Some unusual cases are presented and commented on from a psychoanalytic viewpoint. Information regarding 3 magical healers is included.

2924. **Smith, Donald E.** (Inst of Religion & Health, New York, NY) **The next decade of dialogue: Religion and health.** *Journal of Religion & Health*, 1974(Jul), Vol 13(3), 161-179.—Reinterprets the relationships between religion and psychology and offers some forecasts about the future. Both disciplines face dramatic and radical redefinitions. They must meet the "real" issues of overpopulation, new values, the interdependence of people, outer space, and permanently instituted wealth with its corresponding permanence of poverty. Mental health is relative and behavioral norms are shifting rapidly; many people begin to doubt the value of psychology as they doubt religion. Mental health and spiritual growth are considered to be largely identical concepts; the former is primarily social, the latter is individual. Psychology deals more with the social aspect. Collective images regarding the 2 disciplines are emerging; increasingly the psychologist is viewed as the "witch doctor" and the clergyman as "the fool." It is suggested that psychology has refused to deal with moral issues in the past, but is now asked to make such judgments. The goals of psychology and religion are similar and the boundaries between them are blurred. While psychology's alignment with science has been intense and desperate, it cannot deny its links with magic elements and it must ultimately deal with questions about the purpose of human existence.—*F. Hardt.*

2925. **Thomas, Charles W.** (U California, Third Coll, San Diego) **The significance of the E(thnocentrism) factor in mental health.** *Journal of Non-White Concerns in Personnel & Guidance*, 1974(Jan), Vol 2(2), 60-69.—Explores the concept of ethnicity as a basis for establishing more realistic and egalitarian practices in American life. There has been an intensive search among people of color for effective means of preventing psychological problems and of promoting psychological soundness through the use of ethnic awareness, identity, and pride. In an examination of the historical referent which has attached negative social values to ethnicity, it is argued that the contingencies of ethnicity as a means for achieving personal significance and social control require a new way of looking at the urban condition or any critical mass (e.g., college campuses, reservations,

penal institutions, or the military services) as an expression of the national fabric.—*M. E. Pounsel.*

2926. Thomas, David R. (U Waikato, Hamilton, New Zealand) **Social distance in Fiji.** *Journal of Social Psychology*, 1974(Aug), Vol 93(2), 181-185.—Administered a social distance scale to 30 Fijian and 30 Indian women from rural areas in Fiji. In contrast to an earlier study, it was found that the Indian Ss showed consistently greater social distance towards ethnic outgroups than the Fijian Ss. The difference between the 2 groups was related to differences between the Fijian and Indian cultures, particularly to the differences in sex roles within the 2 cultures.—*Journal abstract.*

2927. Tygart, Clarence E. (California State U, Fullerton) **Work alienation and politics among clergy.** *Journal of Vocational Behavior*, 1974(Aug), Vol 5(1), 103-114.—Investigated the neo-Marxian supposition that alienated work has effects for politics. Unlike M. Seeman's (see PA, Vol 41:10294) study which found no relationship, in the present sample of 321 clerical respondents work alienation explained 10% of the variance for politics. Results suggest the importance of respondents' ideological orientation for interpreting relationships between work alienation and politics. Among clergy with generally conservative ideology, there was no relationship between work alienation and politics. The strength of the relationship between work alienation and liberal politics for theologically liberal clergy was about the same as for the entire sample. The greatest increase in political liberalism or leftism was among neo-orthodox theologians who attributed a relatively smaller percentage of their total life interest to their work. (19 ref)—*Journal abstract.*

2928. Williams, Robert L. (U Washington) **The death of white research in the black community.** *Journal of Non-White Concerns in Personnel and Guidance*, 1974(Apr), Vol 2(3), 116-132.—Discusses and offers strategies for bringing about an end to the exploitation of the black community by insensitive researchers. Examples of misguided research that has been conducted in the black community are provided to illustrate the effect such research has had on the black community. A 3-pronged description of the individual who should be permitted to conduct research in black communities is offered: (a) the state of mind of the researcher, (b) his past research record as it relates to the black community, and (c) whether the research will provide direct and/or indirect benefits to the black community. (32 ref)—*M. E. Pounsel.*

2929. Wober, Mallory. (Makerere U, Kampala, Uganda) **On cross-cultural psychology.** *Bulletin of the British Psychological Society*, 1972(Jul), Vol 25(88), 203-205.—Comments on an article by J. L. M. Dawson (see PA, Vol 48:2819) on theory and research in cross-cultural psychological studies. Tribute is paid to Dawson's studies of psychology in Africa, but several theoretical and interpretive points in the cited article are disputed.

#### Social Issues & Social Processes

2930. Amara, Roy. **Toward understanding the social impact of computers.** Menlo Park, CA: Institute for the Future, R-29, 1974. 136 p. \$10.—Describes the proceedings and recommendations of 4 workshops on various

aspects of the social significance and impact of computer technology, including computer models and simulations as aids to decision making, the use of computers in financial operations, perceptions and attitudes toward computers, and individual access to computers. A program for increasing understanding of how computers affect individual behaviors and perceptions and the potential societal benefits of computers is presented. (6 p ref)

2931. Boggs, David L. (Ohio State U) **An interpretive review of social science research on behaving—valuing patterns of low status people.** *Adult Education*, 1974, Vol 24(4), 293-312.—Derived from scholarly studies of behaviors of low-status Americans a theory-based perspective for interpreting their behaving-valuing patterns. Valuing is defined, from the point of view of the valuing S, as an activity tied to satisfaction of needs and assuagement of desires. L. Kreiberg's hypothesis that behaviors and values can be modified to the extent that they are serially independent, noncentral to self-concept, monitored by peers, and dependent upon external circumstances was found to be particularly useful in accounting for the malleability of conventional behaviors and values and the formation of new adaptive problem-solving ones among low-status people. Implications for adult basic education are discussed. (25 ref)—*Journal abstract.*

2932. Bottomley, Gillian. (Macquarie U, School of Behavioural Science, North Ryde, NSW, Australia) **Some Greek sex roles: Ideals, expectations and action in Australia and Greece.** *Australian & New Zealand Journal of Sociology*, 1974(Feb), Vol 10(1), 8-16.—Combined information from a literature review with fieldwork among 14 families of Greek descent in Sydney, Australia. The level of formal emancipation in Australia was found to affect visibly only a few highly educated individuals. A traditional Greek ideology is sustained by many families, but the structural prerequisites for patriarchal power concealing the informal power held by women are not found in the Australian urban setting. The traditional family model is sustained by close-knit networks that form moral communities closely linked with the Greek subculture in Sydney.—*Journal summary.*

2933. Brody, Eugene B. (U Maryland, Medical School, Inst of Psychiatry & Human Behavior, Baltimore) **Psychocultural aspects of contraceptive behavior in Jamaica: Individual fertility control in a developing country.** *Journal of Nervous & Mental Disease*, 1974(Aug), Vol 159(2), 108-119.—Analyzes the psychosocial and cultural factors which influence the self-regulation of fertility in developing countries, illustrated by data and case histories from Jamaica. Most of these variables have their roots in the family and household systems of the country and reflect the quality of lower socioeconomic status life and continuing exclusion from the cultural process of the dominant group. They include poor communication between sexual partners, a pattern of "strictness" in child rearing combined with conflicting nonverbal communications from parents, high value attached to the status and role of mother, negative perceptions of Jamaican men combined with a lack of alternative nonmaternal roles for women, socially sanctioned loose conjugal and household structures with little

pressure on men to assume responsibility for their children and multiple paternity, and reinforcement of anxiety about contraception as a consequence of cultural exclusion and lack of effective communication with societally powerful persons. These factors may diminish the influence of government-sponsored family planning campaigns. (20 ref)—*Journal abstract*.

2934. Brongersma, E. **Sexuality and the law.** *Journal of the American Institute of Hypnosis*, 1973(Sep), Vol 14(5), 210-221.—Considers that the law cannot legislate sexual morality and that society has no right to intervene in violations of the law which do not infringe on the rights of others (e.g., prostitution or pornography). The Speijer report, an analysis of the penal code and its relationship to sexual behavior in the Netherlands, is examined as a modern and enlightened approach.

2935. Bryan, William L. **Toward a viable environmental movement.** *Journal of Applied Behavioral Science*, 1974, Vol 10(3), 387-401.—Considers that an adequate and effective environmental movement must focus on resolving problems in the relationship between man and his natural environment in a way that will end human exploitation. Once the environmentalist has set overall humanitarian goals, he should follow the strategies of successful political activists (e.g., choosing a popular issue and building grassroots support). (23 ref)

2936. Carte, Gene E. (Trenton State Coll) **Changes in public attitudes toward the police: A comparison of 1938 and 1971 surveys.** *Journal of Police Science & Administration*, 1973(Jun), Vol 1(2), 182-200.—Reports that in 1938 the public wanted a police force that was disciplined, effective, well equipped, and nonpolitical. Little concern was expressed for police attention to the rights of minority groups. Responses reflected tolerance toward harsher treatment of Negroes, aliens, gangsters, and radicals; these responses conflicted with others which claimed high regard for constitutional rights. There was almost no interest in citizen participation in police policy making. The 1971 survey reflected other citizen concerns. While the public still expected competence and personnel quality, a desire was expressed for the police to be more representative of the communities they serve. Citizen participation in making police policy was felt to be desirable, and sympathy was expressed with the rights of the police as workers. The current trend toward increasing insularity of police work, arising from professional ideology and public pressure for police effectiveness, is seen as a source of growing antagonism between the police and some segments of the public.—R. S. Albin.

2937. Casler, Lawrence. (State U New York, Geneseo) **Is marriage necessary?** New York, NY: Human Sciences Press, 1974. ix, 249 p. \$8.95.—Presents an analysis and critique of the history, functions, and relevance of the institution of marriage. The necessity of including child-bearing and child-rearing within the framework of marriage is questioned, research on the parentless child is discussed, and the social and psychological implications of various alternatives to marriage that have recently emerged or will perhaps emerge (e.g., group marriage) are examined. (20½ p ref)

2938. Crawford, Thomas J. (U California, Berkeley) **Police overperception of ghetto hostility.** *Journal of*

*Police Science & Administration*, 1973(Jun), Vol 1(2), 168-174.—Compared the answers of 397 adult ghetto residents of a small industrial city to questions about their attitudes toward the police with the replies that police officers in the city predicted ghetto residents would make to 5 specific questions about the police. The response predicted by the police to each question was more antipolice than the actual public response. Possible explanations of this overestimation by the police of the amount of antipolice feeling are considered (e.g., invalid replies by the public, sample bias, self-fulfilling prophecy, and the projection by prejudiced police officers of their own hostility onto the minority groups they dislike). The implications of these findings for police recruitment are discussed.—R. S. Albin.

2939. Crockett, George W. **Justice, the courts and change.** *Journal of Applied Behavioral Science*, 1974, Vol 10(3), 361-366.—Discusses the ways in which black judges are catalysts for progressive change in the judiciary system, particularly in the areas of individual rights and racism. A hearing involving a confrontation between police and a black militant group in which the author was the judge is described to illustrate these changes.

2940. Crowfoot, James E. & Chesler, Mark A. (U Michigan) **Contemporary perspectives on planned social change: A comparison.** *Journal of Applied Behavioral Science*, 1974, Vol 10(3), 278-303.—Offers a typology of social change efforts based on an analysis of their divergent root assumptions about values and the nature of reality rather than a categorization of their various activities. 3 perspectives of planned social change—the professional-technical, the political, and the countercultural—are discussed in terms of such issues as their varying kinds of constituencies and resources. (93 ref)

2941. Eagly, Alice H. & Anderson, Pamela. (U Massachusetts, Amherst) **Sex role and attitudinal correlates of desired family size.** *Journal of Applied Social Psychology*, 1974(Apr-Jun), Vol 4(2), 151-164.—A survey conducted in 1971 with 386 undergraduates tested the hypothesis that persons approving of a relatively equivalent pattern of sex roles desire to have smaller families than do persons approving of less equivalent sex roles. Though the hypothesis was confirmed for the number of children that Ss desired to procreate, approval of sex role equivalence was 1 component of a more general pattern in which Ss who desired to procreate fewer children were nontraditional in their attitudes (e.g., favoring women's liberation movement ideas, and perceiving themselves as nonreligious). However, the role and attitudinal predictors related less strongly to the total number of children desired (i.e., the sum total of the number of children desired as a biological parent plus the number of adoptions desired). (24 ref)—*Journal abstract*.

2942. Fishbein, Martin & Coombs, Fred S. (U Illinois) **Basis for decision: An attitudinal analysis of voting behavior.** *Journal of Applied Social Psychology*, 1974(Apr-Jun), Vol 4(2), 95-124.—Proposes a psychological theory which suggests that a person's attitude toward any object is a function of his beliefs about the object and the evaluative aspects of those beliefs. Thus,

in the political arena, a person should like or dislike a given candidate because (a) he believes the candidate has certain personal characteristics, is affiliated with certain reference groups, or is for or against various issues; and (b) evaluate these characteristics, groups, and issues positively or negatively. Evidence from a local survey of 1,063 voters in the 1964 presidential election supports this theory and its application to voting behavior. In addition, data clearly indicate that voters do take partisan stands on some issues, do clearly discriminate between the candidates on certain issues, and do change their beliefs during the course of a campaign. (34 ref) —*Journal abstract.*

2943. Gamson, William A. (U Michigan) **Violence and political power: The meek don't make it.** *Psychology Today*, 1974(Jul), Vol 8(2), 35-41.—Analyzed 53 American social movements and found that groups had a better chance of success if they were willing and able to act violently when necessary. Successful movements sought limited goals rather than an overthrow of the system. Chances of success were also greater if the movement had a unified command and a bureaucratic structure. Groups employing only polite debate and seeking to involve many people in the decision-making process almost always experienced failure.—E. J. Posavac.

2944. Gitter, A. George & Mostofsky, David I. (Boston U.) **The Social Indicator: An index of the quality of life.** *Social Biology*, 1973(Sep), Vol 20(3), 289-297.—Elaborates a "social indicator" measurement model. Questions are raised to aid in an evaluation of this technique and the relative merits of using subjective and objective data are discussed.

2945. Gross, Alan E.; Schmidt, Michael J.; Keating, John P. & Saks, Michael J. (Ohio State U) **Persuasion, surveillance, and voting behavior.** *Journal of Experimental Social Psychology*, 1974(Sep), Vol 10(5), 451-460.—4,392 undergraduates received 1 of 3 letters urging them to vote in a campus primary election. 2 letters suggesting that voting behavior would be monitored produced 37% turnout compared with 32% for a nonsurveillance letter and 26% for no-letter controls ( $n = 4,392$ ). Differences between groups were significant at ( $p < .01$ ). The letters also increased turnout in a runoff election held 1 wk after the primary; however there were no differences among the 3 letters.—*Journal abstract.*

2946. Harry, Joseph. (Wayne State U) **Urbanization and the gay life.** *Journal of Sex Research*, 1974(Aug), Vol 10(3), 238-247.—Collected data from a national sample of gay bars. Analysis indicated that gay bars are located in or near large cities and resort areas. It is noted that homosexuals tend to be subject to the same economic and cultural influences and processes as heterosexuals.

2947. Houston, Judith A. & Houston, Samuel R. (U Northern Colorado) **Identifying pornographic materials with judgment analysis.** *Journal of Experimental Education*, 1974(Sum), Vol 42(4), 18-26.—Tested the Judgment Analysis (JAN) methodology for determining what is pornographic with 3 groups concerned with this issue. These groups included 28 doctoral students majoring in psychology, counseling, and guidance; 21 lawyers; and 25 police officers. JAN proved to be an effective

technique in the identification of policies. It is concluded that the problem of what is pornographic is a complex one, as evidenced by the many specific categorical and complex policies present in the 3 S groups.—*Journal abstract.*

2948. Jacob, Philip E. (U Pennsylvania) **Leadership and social change: Report on the Evaluative Conference on Comparative Studies of Leadership and Social Change.** *Social Science Information*, 1971(Feb), Vol 10(1), 155-162.—Reports on a conference study of the influence of values of leaders on community developmental change in India, Poland, the US and Yugoslavia. Internal homogeneity and cross-national equivalence were major concerns in interpreting 9 scales of values. It is noted that when behavior occurs in differing social and legal systems, indicator inconsistencies must be anticipated. Diverse leader values between countries were not closely associated with community activeness. It is concluded that cooperative cross-national study is worth the high cost if it provides both contact and results.—R. J. Anderson.

2949. James, William H. (University Coll London, Galton Lab, England) **Marital coital rates, spouses' ages, family size and social class.** *Journal of Sex Research*, 1974(Aug), Vol 10(3), 205-218.—Analyzed data from 2 surveys on human sexual behavior. Major findings were as follows: (a) When social class and the number of children are held constant, coital rates declined more rapidly with husband's age than with wife's age. (b) When duration of marriage is held constant, coital rate correlated positively with number of children. (22 ref)—E. B. Jaffa.

2950. Kelly, Joseph A. & O'Rourke, Thomas W. (U Illinois, Police Training Inst) **An appraisal of the attitudes of police officers toward the concept of police-community relations.** *Journal of Police Science & Administration*, 1973(Jun), Vol 1(2), 224-231.—Analyzed responses to a 20-item survey form which assessed the attitudes and beliefs of 200 policemen who were about to receive workshop training in police-community relationships. A high degree of positivism characterized all responses. Attitudes were not influenced by any of the demographic variables (i.e., age, rank, police experience, previous police training, educational background, size of the police department, type of location, and ethnicity). The possibility that these reported highly positive attitudes are not actually reflected in police performance is discussed, and the significance for police training programs is considered.—R. S. Albin.

2951. Kinkade, Kathleen. **Power and the utopian assumption.** *Journal of Applied Behavioral Science*, 1974, Vol 10(3), 402-414.—Discusses power sources and issues in communal groups, based on the author's 8 yrs of communal living. It is argued that the counterculture approach of pretending power does not exist is unrealistic; the problem is not how to escape from power but how to control it. Ways in which various communal groups have dealt with power issues are examined.

2952. Klein, Hillel & Last, Uriel. (Hadassah Medical School, Jerusalem, Israel) **Cognitive and emotional aspects of the attitudes of American and Israeli youth towards the victims of the holocaust.** *Israel Annals of Psychiatry & Related Disciplines*, 1974(Jun), Vol 12(2).

- 111-131.—Evaluated the actual knowledge and cognitive and emotional attitudes of groups of 308 7th- and 8th-grade Jewish schoolchildren in the US and Israel in 1968 after the 6-Day War. Ss were classified according to their degree of personal psychological involvement in the war. Marked differences between the Israeli and American groups were observed, with the Israeli Ss having a higher and more uniform knowledge of the war and associated events. In the American Ss, knowledge was related to the degree of psychological involvement. In both groups, a realistic attitude toward victims of the war predominated. Idealizing tendencies were only moderately prevalent. Emotions of anger and contempt appeared more frequently in the American Ss with a lesser degree of personal closeness to the events. Possible explanations for these differences are discussed in terms of the educational approach to the war, differences in the social norms of the 2 countries, and in the amount of direct contact with survivors. American Ss' responses may have been affected by the psychological conflicts associated with the position of Jewish children in US society, whereas Israeli responses may reflect a sense of identification with the continuity of the Jewish people, the danger of annihilation, and personal experiences during the war.—*Journal abstract*.
2953. Krug, Samuel E. & Henry, Thomas J. (Inst for Personality & Ability Testing, Champaign, IL) **Personality, motivation, and adolescent drug use patterns.** *Journal of Counseling Psychology*, 1974, Vol 21(5), 440-445.—Examined interrelationships between patterns of drug abuse and personality and motivation for 285 college freshmen and 278 high school seniors. Ss completed the 16 Personality Factor Questionnaire, the Motivation Analysis Test, and a questionnaire regarding drug use. Drug users were significantly different from controls on 17 scales of the inventories. Significant sex differences were found with respect to drug behavior. Females used amphetamines more frequently than males and also showed greater multiple drug use. Child-rearing practices involving the neglect of discipline and absence of training in societal or ethical standards are suggested as significant in adolescent drug abuse.—*Journal abstract*.
2954. Leif, Irving P. **Bibliography.** *Current Sociology*, 1972, Vol 20(2), 57-138.—Presents an annotated bibliography of research on community power and decision-making, including sections on community power and theory, the methodology of community power, community studies, comparative community studies, and the study of community power and decision-making. The references serve as the basis for T. N. Clark's (1972) review of the field (see PA, Vol 53:Issue 2). (550 ref)
2955. Levin, Henry M. (Stanford U) **Educational reform and social change.** *Journal of Applied Behavioral Science*, 1974, Vol 10(3), 304-320.—Argues that although most contemporary societies view the educational system as a powerful tool of social change, schools will always be used to reproduce society rather than to modify it. Educational reform can never be used as an independent force for changing social, economic, and political relationships. (29 ref)
2956. Mogulof, Melvin B. (Urban Inst, Washington, DC) **Advocates for themselves: Citizen participation in federally supported community organizations.** *Community Mental Health Journal*, 1974(Spr), Vol 10(1), 66-76.—Discusses variations in the intensity of citizen participation in community organizations and variations in the decision structures for participation (e.g., advisory mechanisms or citizen control). It is concluded that although control mechanisms may have certain negative consequences for racial integration, citizen participation should be viewed as a policy goal as well as an instrument for achieving other goals.
2957. Myrick, Fred L. (U Alabama, Birmingham) **Homosexual types: An empirical investigation.** *Journal of Sex Research*, 1974(Aug), Vol 10(3), 226-237.—Analyzed the attitudes of homosexually oriented bar patrons. Findings indicate that homosexuality exists on a continuum ranging from complete concealment to complete disclosure. (27 ref)
2958. Nail, Richard L.; Gunderson, E. K. & Kolb, Douglas. (US Navy Medical Neuropsychiatric Research Unit, San Diego, CA) **Motives for drug use among light and heavy users.** *Journal of Nervous & Mental Disease*, 1974(Aug), Vol 159(2), 131-136.—Reports reasons given for use of 6 illicit drugs—cannabis, opiates, hallucinogens, amphetamines, barbiturates, and cocaine—by 997 entrants to a US Navy drug rehabilitation facility. Specific reasons were divided into 2 categories: hedonistic and therapeutic. Ss were classified by level of involvement based upon light or heavy use of each drug. Reasons given by both light and heavy users of hallucinogens and cocaine were predominantly hedonistic. Heightened sentence and "psychedelic" experiences appeared to be the objective of hallucinogen users whereas heightened sexual pleasure was the primary motive for cocaine users. Reasons for using amphetamines, barbiturates, and opiates were almost exclusively therapeutic among heavy users. Amphetamines were used to improve functioning and relieve depression, and barbiturates to relieve anxiety. Reasons for using opiates included both of these components, and opiate users appeared to seek a pervasive feeling of well-being as well as "escape from reality." Reasons for cannabis use were diverse and suggested desires for intoxication, relaxation, social belongingness, and heightened sensory awareness.—*Journal abstract*.
2959. Neulinger, John. (City Coll, City U New York) **The psychology of leisure: Research approaches to the study of leisure.** Springfield, IL: Charles C Thomas, 1974. xxii, 216 p.—Describes various approaches to the study, measurement, and interpretation of leisure. Topics include a history of the concept of leisure, various research methodologies (e.g., time-budget studies and typological evaluations), the role of sex, age, socioeconomic, and religious variables in leisure, the formation of leisure attitudes, and the new leisure ethic. (14½ p ref)
2960. O'Day, Rory. (U Waterloo, Ontario, Canada) **Intimidation rituals: Reactions to reform.** *Journal of Applied Behavioral Science*, 1974, Vol 10(3), 373-386.—The reaction of authority in social systems to the reform initiatives of a subordinate is viewed as a series of intimidation rituals. These rituals are divided into 2 major phases, each involving 2 distinct steps. The 1st phase, indirect intimidation, includes the rituals of nullification and isolation; the 2nd, direct intimidation,

involves the rituals of defamation and expulsion. A discussion of why these rituals for protest-suppression in organizations are powerful tools in the hands of the middle manager is presented. Attention is also given to various images projected by the organizational reformer and reasons for resistance to reform from within an organization. (21 ref)—*Journal abstract*.

2961. **Pernanen, Kai.** (Addiction Research Foundation, Toronto, Ontario, Canada) **Validity of survey data on alcohol use.** In R. J. Gibbons et al (Eds), *Research advances in alcohol and drug problems: I*. New York, NY: John Wiley & Sons, 1974. xvii, 428 p.—Discusses the use of coverage estimates for total alcohol consumption and for consumption of different types of alcoholic beverages as indicators of aggregate validity of central dependent variables in surveys of alcohol use. Estimates can be made by a comparison of yearly sales figures with survey estimates of annual consumption. Reasons for the lack of aggregate validity in many surveys are discussed, and the problems of noncoverage, selective reporting, and nonresponse are examined. (49 ref)

2962. **Polk, Barbara B.** **Male power and the women's movement.** *Journal of Applied Behavioral Science*, 1974, Vol 10(3), 415-431.—Explores the power relationship between females and males, using 4 differing perspectives found in the contemporary women's movement: analysis of socially defined sex roles, conflicting cultures, power analysis, and the socialist perspective. The sources of male power suggested by these perspectives are identified, and the varying activities of the women's movement are discussed in terms of their potential impact on these forms of power.—*Journal abstract*.

2963. **Reiff, Robert.** (Albert Einstein Coll of Medicine, Yeshiva U) **The control of knowledge: The power of the helping professions.** *Journal of Applied Behavioral Science*, 1974, Vol 10(3), 451-461.—Contends that the basis of professional power is not knowledge itself but the control of knowledge. Historically, the helping professions have been mandated and licensed by society to define who is deviant, ill, or needy and who is entitled to what help in the promotion of human welfare. It is argued that while the helping professions today have a vested interest in maintaining a commodity concept of their services, the very nature of their service policies deprives their clients of their rights as consumers. If a community wishes to reduce the power of the helping professions it will have to break up their monopolistic control. If the institutions of professionalism—its educational systems and organizations—were compelled to share their power with society, it would inevitably result in the democratization of knowledge. The potential for such a counterforce already exists in the demands for accountability and control by local communities of the poor, blacks, students, and the paraprofessional movement.—*Journal abstract*.

2964. **Sale, June S.** (Pacific Oaks Coll) **Family day care: A valuable alternative.** *Young Children*, 1973(Apr), Vol 28(4), 209-215.—Studied family day care in a multiracial, working-class area to understand the strengths and weaknesses of this system. 12 licensed and 10 unlicensed women cared for a total of 143 children. Once a month a student went to a family day care home for 4 hrs to work with the instructor and to learn

techniques of working with children. After 1 yr of work with the existing network of family day care mothers, it is concluded that this form of arrangement can and does offer excellent child care services.—R. S. Albin.

2965. **Sanville, Jean & Shor, Joel.** (Inst of the Los Angeles Society for Psychoanalytic Psychology, CA) **Leading ladies and gentlemen: Some clinical cues to transitional phases in husband-wife roles.** *Clinical Social Work Journal*, 1973(Sum), Vol 1(2), 67-77.—Presents clinical examples depicting the changing roles of husband and wife in American culture. Motivations for change, conflicts which often result during the phases of change, and some solutions to these conflicts are described.

2966. **Schmidt, L. L.** (Simon Fraser U, Burnaby, British Columbia, Canada) **Sex-role attitudes and differing life-styles of professional married women.** *Canadian Counsellor*, 1974(Jun), Vol 8(3), 197-206.—Surveyed 151 professionally-trained married women regarding current sex-role attitudes and preferences, selected biographical data, and life-style choice. An attempt was also made to determine relationships and/or differences existing among these variables and other psychological test data. It was found that Schmidt's Sex-role Inventory was a valid instrument in differentiating the traditional and liberationist groups, as well as differentiating among groups with differing life-styles, sex-role attitudes and preferences, and levels of cognitive dissonance. The Edwards Personal Preference Schedule and Study of Values also differentiated among the groups. (French summary) (20 ref)—*Journal abstract*.

2967. **Sloan, Lloyd R.; Love, Robert E. & Ostrom, Thomas M.** (U Notre Dame) **Political heckling: Who really loses?** *Journal of Personality & Social Psychology*, 1974(Oct), Vol 30(4), 518-525.—Hecklers (confederates) vocally attacked videotaped presentations of presidential contenders' (Nixon and Muskie) 1970 election eve broadcasts which were viewed by 229 undergraduates. Final agreement with the speaker depended upon viewer's initial opinion, the presence vs absence of hecklers, and the speaker himself. Heckling produced opposition to the speaker in initially neutral people and change toward neutrality for Os with initially extreme opinions. These effects were still observable 2 mo later, attesting to the importance and effectiveness of disruptive politics.—*Journal abstract*.

2968. **Steinbruner, John D.** (Harvard U) **The cybernetic theory of decision: New dimensions of political analysis.** Princeton, NJ: Princeton University Press, 1974. xi, 366 p. \$14.50.—Presents a discussion of the applicability and relevance of cybernetic decision theory to political events, and specifically, how decisionmakers deal with the uncertainty and fundamental value conflicts that arise in bureaucratic politics. An analysis of the issue of sharing nuclear weapons among North Atlantic Treaty Organization (NATO) allies is presented as an illustration. (17 p ref)

2969. **Stern, Etta G. & MacLennan, Beryce W.** (NIMH, Mental Health Study Ctr, Adelphi, MD) **Integrating minority and majority youth: A socio-drama group as a human relations model.** *Journal of Non-White Concerns in Personnel and Guidance*, 1974(Apr), Vol 2(3), 146-155.—Describes the role of a sociodrama group to

improve general human relations in schools affected by desegregation. The Racial Perceptions Inventory (Borus, Finan, and Stanton) was administered twice to the 20-member racially mixed group to learn whether apparent acceptance of each other within the group carried over to racial attitudes outside the group. Results of the 1st inventory show that whites generally responded positively far more than did blacks to statements favoring integration at all levels, not only in terms of school and community integration, but also in the social context; the 2nd inventory showed a reversal of these attitudes. It is suggested that since the attitudes reflected in the latter inventory did not mirror the behavior or opinions of the group in their improvisations, the apparent change was a result of a racial confrontation that had occurred in the school prior to inventory readministration. Improvisational theatre is seen as an effective means of bringing individual problems out into the open.—*M. E. Pounsel.*

2970. Sutcliffe, Claud R. (Williams Coll) **The effects of differential exposure to modernization on the value orientations of Palestinians.** *Journal of Social Psychology*, 1974(Aug), Vol 93(2), 173-180.—Tested the hypothesis that differential exposure to modernization leads to differential preferences in value orientations, using interview data drawn, from 5 samples of Palestinians ( $N = 215$ ) ranging from traditional peasants to college students. In general, results support this hypothesis. However, the extent of the effect (and its direction in the case of activity orientation) varied according to the particular variable used as an indicator of exposure to modernization, as well as the particular question used as a measure of value orientations.—*Journal abstract.*

2971. Tate, Eugene; Hawrish, Ernest & Clark, Stanley. (St Thomas More Coll, U Saskatchewan, Saskatoon, Canada) **Communication variables in jury selection.** *Journal of Communication*, 1974(Sum), Vol 24(3), 130-139.—Studied the effect of age, sex, occupation, socioeconomic status, and appearance on jury selection in Canada. 50 lawyers were interviewed and asked to evaluate a jury list on a 7-point scale as to whether a juror could be definitely accepted or rejected for a given trial. Ss were shown pictures at the end of the interview. Results indicate that men were preferred over women, younger persons (between 20 and 30) were generally more acceptable, socioeconomic status did not make a significant difference, and appearance had an effect in only 1 of the 4 types of trials (false prospectus) where a conservative juror was preferred over a modish or rebellious one. (18 ref)—*P. Federman.*

2972. Toomey, Derek. (La Trobe U, Ctr for the Study of Urban Education, Bundoora, Vic, Australia) **What causes educational disadvantage?** *Australian & New Zealand Journal of Sociology*, 1974(Feb), Vol 10(1), 31-37.—Examines 2 views of the educational deprivation thesis based on evidence from Australia. The "strong" view states that pervasive differences in life-style characterize different socioeconomic strata and that these cause differences in children's abilities and personalities of a very general kind that go far beyond the ability needed for success in school learning. The "weak" view states that there are socioeconomic differences in the educational supportiveness of homes in matters closely connected with school learning and ambition, and that

these differences are not necessarily connected with far-reaching and pervasive life-style differences, although they do affect scholastic attainment. The Australian evidence is seen as supporting the weak view, but as insufficient to reject the strong view entirely.—*Journal summary.*

2973. Wackwitz, John H.; Pelfrey, Michael C. & Stenmark, David E. (U South Carolina) **The relationship of social and personality characteristics of hallucinogen use among college females.** *Addictive Diseases: An International Journal*, 1974, Vol 1(2), 189-202.—Administered the Interpersonal Check List (ICL), the MMPI Lie scale, and demographic and drug history questionnaires to 53 female undergraduates at a southern state university. Ss were classified according to the degree of self-reported hallucinogenic drug use: heavy (had used hallucinogenic drugs on more than 10 occasions), moderate (fewer than 10 occasions), and none. Results show that (a) there were significant differences among the groups in self-perceptions of hidden, external, and ideal self; (b) only the Dominance-Self dimension of the ICL showed significant differences among the groups, with a trend to increasing dominance from nonusers to heavy users; (c) there were no significant differences between groups in background environment variables; and (d) there were important powerful relationships between hallucinogen use and peer-friendship cultures. (23 ref)—*L. Gorsey.*

2974. Waldmann, Silvia & Waldmann, Helmut. [The so-called expansion of consciousness: An analysis of drug use by adolescents.] (Germ) *Zeitschrift für Klinische Psychologie und Psychotherapie*, 1972, Vol 20(4), 357-362.—Discusses theories concerning the reasons and motivations leading to drug use by adolescents. The expansion of consciousness; its effects of freeing perceived objects from their real, normal, and usual connection with the factual world; the intensified, heightened, and mostly irrational emotions and experiences; and the qualitative and quantitative sensory changes produced by the drugs are described and evaluated. (English summary) (24 ref)—*T. Fisher.*

2975. Wiener, R. S. (Northern Ireland Research, Inst, Belfast) **Consequences of a self-survey by a Belfast community.** *Journal of Social Psychology*, 1974(Aug), Vol 93(2), 197-201.—Describes how a local community in Belfast, Ireland, designed and carried out a survey of unemployment in its area. The advantages of such local involvement and what hopefully can be achieved by it are discussed.

2976. Wiest, William M. & Janke, Lois D. (Reed Coll) **A methodological critique of research on psychological effects of vasectomy.** *Psychosomatic Medicine*, 1974(Sep-Oct), Vol 36(5), 438-449.—Discusses flaws in published research on the effects of vasectomy and suggests ethnically acceptable, rigorous research designs that will yield more definitive information about the psychological consequences of vasectomy. A discussion is included on the aspects of "a psychological risk" and the validity of the anxiety-reducing and health-promoting effects of the operation. (50 ref)—*Journal abstract.*

2977. Winnik, H. Z. ("Talbieh" Psychiatric Hosp, Jerusalem, Israel) **Drug addiction and law.** *Israel Annals of Psychiatry & Related Disciplines*, 1972(Dec), Vol 10(4).

366-372.—Discusses 3 laws pertaining to drug addiction in Israel, and notes that these laws have not reduced drug abuse. In fact, drug abuse is increasing because of immigration from Western countries, reduction in the barriers to Arab countries, and the fact that the laws have not been diligently enforced. This indulgent law enforcement reflects the following trends: (a) the composition of offenders is changing from professional consumers to casual white-collar and student users, (b) fewer offenders have previous convictions, and (c) the public increasingly accepts the use of "soft" drugs. The degree to which legal, educational, and social methods of preventing drug abuse should be applied are discussed, with emphasis placed on drug traffic control, public education, and rehabilitation of patients.—A. Olson.

## SOCIAL BEHAVIOR AND INTERPERSONAL PROCESSES

2978. Abulkhanova-Slavaskaya, K. A. (USSR Academy of Sciences, Philosophical Inst, Moscow) [Does the problem of the individual exist for psychology?] (Russ) *Voprosy Filosofii*, 1972, No 7, 57-67.—Notes that current academic thought in psychology acknowledges the relationship between the mind and man's interaction with his social environment. Characteristic attributes of the mind are not inferred from abstract definitions developed through deductive techniques, but from man's social behavior. The features of man's social interaction are the basis for inferences about his intrapsychic behavior.—R. A. Meyer.

2979. Ben-Ami, Aharon (Ed.). (Haifa U, Israel) [Social psychology: Socialization, attitudes, groups: A reader.] (Hebr) Tel Aviv, Israel: Am Oved, 1974. 320 p.—Presents a collection of 24 readings for a textbook in social psychology emphasizing socialization, attitudes, and group processes.

2980. Benton, Alan A. & Druckman, Daniel. (U Illinois, Chicago Circle) **Constituent's bargaining orientation and intergroup negotiations.** *Journal of Applied Social Psychology*, 1974(Apr-Jun), Vol 4(2), 141-150.—Studied the bargaining behavior of 80 pairs of female undergraduates on a competitive reward-allocation task. Participants either bargained for themselves or represented the interests of a constituent as well as themselves. Representatives were given information indicating that their constituent expected them to win or to behave cooperatively, or they were given no information concerning their constituent's bargaining orientation. Findings indicate that representational role obligations tend to increase competition between negotiators. However, findings also reveal that this tendency is reduced when pressure to cooperate is applied by constituents to at least one of the representatives. Procedures that aid in the resolution of intergroup conflict are discussed. (18 ref)—*Journal abstract*.

2981. Jandt, Fred E. (State U New York, Brockport) **Communication and the simulation of social conflict.** In G. R. Miller & H. W. Simons (Eds), *Perspectives on communication in social conflict*. Englewood Cliffs, NJ: Prentice-Hall, 1974. xiii, 257 p.—Reviews recent simulation designs in the study of social conflict and issues

involved in the reliability, validity, and interpretation of man-machine and machine studies. The importance of the operating model on which the simulation is based and advantages of simulation techniques in comparison to gaming laboratory and field environment studies are discussed. (3 p ref)

2982. Lay, Clarry; Allen, Marlene & Kassirer, April. (York U, Toronto, Ontario, Canada) **The responsive bystander in emergencies: Some preliminary data.** *Canadian Psychologist*, 1974(Jul), Vol 15(3), 220-227.—Examined some of the characteristics of 2 groups of responsive bystanders (i.e., bystanders who helped a victim in an emergency situation). The sample included 101 Carnegie Hero Medal recipients and 147 Toronto Metropolitan Police Civilian Citation recipients. The data indicate that males directly intervened in emergencies more often than females and that the responsive bystander tended to act alone. The Carnegie analysis suggests that rural people were more heroic than urban people, although possible confounding factors are considered. (French abstract)—*Journal abstract*.

2983. Mischel, Theodore (Ed.). (State U New York, Binghamton) **Understanding other persons.** Totowa, NJ: Rowman and Littlefield, 1974. xv, 266 p.

2984. Novaga, Marcello. (U Degli Studi di Milano, Facoltà Medica, Italy) [Prospects and limits of objective phenomenological experience during the interview.] (Ital) *Archivio di Psicologia, Neurologia e Psichiatria*, 1974(Jan), Vol 35(1), 50-60.—Suggests that the observation of behavior patterns existentially experienced during the interview relationship should be a field of research to build a typology of behavioral responses during this conversational situation.

2985. Rabbie, J. M. (State U Utrecht, Inst of Social Psychology, Netherlands) [Effects of a competitive and cooperative intergroup orientation on within- and between-group behavior.] (Duth) *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1974(Jun), Vol 29(4), 239-257.—Studied the attitudes represented by the "we-feelings" of members of competitive and cooperative groups. Competitive groups did not generally indicate a greater cohesion than cooperative groups. Overvaluation of the product of competitive groups did not seem to occur. Only when employers and employees in competitive groups simulated a reversal of responsibilities did pressure for conformity exceed similar pressures in cooperative groups. Competitive groups did not appear to have greater negative feelings to an outgroup than cooperative groups. Whether competitive or cooperative, the group with which a person becomes affiliated becomes more valuable to him with experience. The behaviors of the 2 groups should be considered in terms of the "mind-sets" of the workers. (English summary) (46 ref)—A. J. Ter Keurst.

2986. Raven, John. (Economic & Social Research Inst, Dublin, Ireland) **The need for an institute of social research.** *Bulletin of the British Psychological Society*, 1972(Jul), Vol 25(88), 219-222.—Discusses the need for an institute of social research in Britain in order to improve standards of research in social psychology and its status in society and the profession.

2987. Sandberg, Irwin W. (Bell Telephone Lab, Murry Hill, NJ) **On the mathematical theory of interaction in**

**social groups.** *IEEE Transactions on Systems, Man, & Cybernetics*, 1974(Sep), Vol 4(5), 432-445.—Cites sociology as an area in which there are a great many verbal propositions concerning the behavior of human groups under various conditions. It is proposed that, if it makes sense to discuss and analyze social phenomena in terms of quantities that are not precisely defined in a mathematical sense (such as the levels of joint activity, interaction, and friendliness associated with a group), then it would seem worthwhile to consider what conclusions can be drawn from the nature and gross quantitative properties of sets of relations that appear to be translations of sets of verbal propositions into the language of mathematics. This question is considered in detail for a particular type of set of verbal propositions. (16 ref) *Journal abstract.*

2988. **Savvy, Joseph & Okun, Morris.** (Pennsylvania State U.) **Form of evaluation and audience expertness as joint determinants of audience effects.** *Journal of Experimental Social Psychology*, 1974(Sep), Vol 10(5), 461-467.—Tested R. Martens and D. M. Landers's (see PA, Vol 49:787) conclusion that direct evaluation of performance and outcomes leads to greater performance impairment than indirect evaluation of outcomes only. Expert and nonexpert audiences (confederates) viewed 88 male undergraduates performing a motor task with visual information and knowledge of outcomes (direct evaluation), with no visual information but knowledge of outcomes (indirect evaluation), and the absence of both visual information and knowledge of outcomes (no evaluation). Contrary to Martens and Landers, with an expert audience, both direct and indirect evaluation impaired performance equally. Results indicate that at least 2 factors in social facilitation research, audience characteristics and form of evaluation, can be considered interactive determinants of evaluation potential. *—Journal abstract.*

2989. **Sherrod, Drury R.** (Kirkland Coll, Div of Social Sciences) **Crowding, perceived control, and behavioral aftereffects.** *Journal of Applied Social Psychology*, 1974(Apr-Jun), Vol 4(2), 171-186.—Conducted a laboratory experiment in which groups of 71 female high school students performed simple and complex tasks for 1 hr in 3 conditions of crowding: noncrowded, crowded, or crowded-with-perceived-control. Immediately afterward, all groups worked in a noncrowded situation on 2 additional tasks, one involving frustration tolerance and the other involving quality of proofreading performance. Conditions of crowding had no effect on simple or complex task performance. In the postcrowding situation, however, significant negative behavioral aftereffects were observed for the crowded groups on the frustration tolerance measure, though perceived control ameliorated these aftereffects. There were no significant aftereffects on the proofreading measure. were ref)—*Journal abstract.*

2990. **Tompkins, Phillip K.; Fisher, Jeanne Y.; Infante, Dominic A. & Tompkins, Elaine V.** (State U New York, Albany) **Conflict and communication within the university.** In G. R. Miller & H. W. Simons (Eds), *Perspectives on communication in social conflict*. Englewood Cliffs, NJ: Prentice-Hall, 1974. xiii, 257 p.—Describes models of organizational conflict applicable to university settings

and presents a review of the types of conflict that can occur within the university. Data from a recent study of a northeastern state university bearing on attitudes toward conflict and conflict aftermath are presented, and the relationships between conflict and communication are examined.

### Group Dynamics & Interpersonal Communication

2991. **Benjamin, Lorna S.** (U Wisconsin) **Structural analysis of social behavior.** *Psychological Review*, 1974(Sep), Vol 81(5), 392-425.—Presents a brief review of the literature on structural analysis of interpersonal behavior followed by a proposal which draws heavily from prior models, especially those of E. S. Schaefer (1965) and T. Leary (1957). The proposed model goes beyond previous ones in that it has a highly explicit structure which defines behavioral opposites, complements, and antidotes. Built on 2 axes named affiliation and interdependence, the model describes dyadic social interactions in terms of complementary proportions of those underlying dimensions. Opposite behaviors appear at 180° angles whereas complementary behaviors appear at topologically similar positions on 2 separate planes. Antidotes are defined as opposites of complements. The proposed structure was tested using the questionnaire responses of normal as well as psychiatric Ss. Analysis of these data by the techniques of autocorrelation, circumplex analysis, and factor analysis supports the model. (39 ref)—*Journal abstract.*

2992. **Bishop, George D. & Myers, David G.** (Yale U) **Informational influence in group discussion.** *Organizational Behavior & Human Performance*, 1974(Aug), Vol 12(1), 92-104.—Examined an informational influence explanation of group-induced shift on choice dilemma items by experimental manipulation and by a mathematical model based on information weighing assumptions. Ss were 116 undergraduates. Although the exchange of arguments in an interactive discussion context produced significant response change, passive reading of arguments did not. Examination of the model revealed that at a molar level the mean model prediction for an item corresponded closely with the mean shift observed on that item following discussion. At a more molecular level, the informational model failed to predict the magnitude of specific group shifts on particular items. A suggestion as to how the informational influence explanation could be refined to accommodate these findings is taken from theory and research on the role of cognitive learning and cognitive rehearsal in attitude change. (30 ref)—*Journal abstract.*

2993. **Brownell, Winifred & Smith, Dennis R.** (U Rhode Island) **Communication patterns, sex, and length of verbalization in speech of four-year-old children.** *Speech Monographs*, 1973(Nov), Vol 40(4), 310-316.—Studied the quantity of speech produced by preschool children as a function of group size. The mean length of verbalization of 56 4-yr-old Head Start children was measured in 4 communication patterns—dyad, triad, small group, and role-playing triad. The children produced more speech in the small group than in the dyad. Differences between other patterns were not significant. Similar results were obtained when repetitions of words and phrases were eliminated. Females

produced more speech than males in all communication patterns.—*Journal abstract.*

2994. Godwin, William F. & Restle, Frank. (Educational Testing Service, Princeton, NJ) **The road to agreement: Subgroup pressures in small group consensus processes.** *Journal of Personality & Social Psychology*, 1974(Oct), Vol 30(4), 500-509.—Tested 4 models of the process of a small group coming to consensus with groups of 3, 4, 5, and 6 undergraduates. 10 groups of each size were tested on 20 4-choice problems. Model 1 said that consensus was reached by random changes of opinion; it failed by far to account for the attractiveness of large subgroups who shared a single position. Model 2 said that each individual had attractiveness  $\alpha$  and that the probability of shift to a position depended upon the sum of attractiveness of people at that position. When such a model predicted equal probability of change toward or away from consensus, movement toward occurred with a probability of about .90, away with a probability of only .05. Model 3 said that large subgroups might have an attractiveness disproportionate to their number of members. However, it was shown that the attractiveness of a subgroup was not constant but depended upon the size of the whole group. Model 4 said that the attractiveness of a subgroup depended upon its relative size, particularly if it was 1 member short of consensus, or if it constituted a majority. This last model was not disproved by the present data. (16 ref)—*Journal abstract.*

2995. Greenberg, S. & Formanek, R. (Hofstra U) **Social class differences in spontaneous verbal interactions.** *Child Study Journal*, 1974, Vol 4(3), 145-153.—Observed spontaneous language behavior of 50 middle- and 50 lower-class mother-child pairs in 2 pediatricians' waiting rooms to determine the relationship between mode of language and social class. Additionally, the views of B. A. Bernstein (1959) and W. Labov (1969) were contrasted for their saliency to educational intervention. Results of the observations support several of Bernstein's notions in that data for mothers resembled data for children within the same class except for the motherly function of socialization. Main class differences were higher overall verbal productiveness, more questions asked, and fewer commands given by middle-class members. (15 ref)—*Journal abstract.*

2996. Hamlyn, D. W. (U London, Birkbeck Coll, England) **Person-perception and our understanding of others.** In T. Mischel (Ed), *Understanding other persons*. Totowa, NJ: Rowman and Littlefield, 1974. xv, 266 p.—Considers that any understanding of other people presupposes an understanding of what people are in general and that complete understanding of a person is impossible without standing in a personal relationship to him. 4 conceptual principles concerning what is necessary to something's being properly considered as an object of knowledge are discussed in detail.

2997. Hamner, W. Clay. (Michigan State U, Graduate School of Business) **Effects of bargaining strategy and pressure to reach agreement in a stalemated negotiation.** *Journal of Personality & Social Psychology*, 1974(Oct), Vol 30(4), 458-467.—Determined the effectiveness of various bargaining strategies under stalemate conditions. Ss were 96 male undergraduates. 4 bargaining

styles were replicated in a stalemated bilateral monopoly paradigm under both high and low pressure to reach agreement conditions: "tough," conciliatory or "soft," "intermediate" or moderately tough, and "fair." When Ss were faced with high pressures to reach agreement, they took fewer trials to reach agreement, had a higher concession rate, and reached agreement more often than Ss who faced low pressure to reach agreement. The tougher the opponent faced by the Ss, the higher was the number of cases where no agreement was reached, and the higher was the number of cases where the "last clear chance" offer was refused. Contrary to the anticipated results, a soft strategy resulted in significantly higher payoffs in both pressure conditions. (26 ref)—*Journal abstract.*

2998. Kitano, Eimasa. [Effect of group competition and cooperation on recall.] (Japn) *Japanese Journal of Educational Psychology*, 1972(Dec), Vol 20(4), 226-235.—Studied the effect of group characteristics on memory. 6 groups of 24 high school students, characterized as introverted and extraverted, were equally assigned to competitive and cooperative groups. For all groups the task was to memorize a fictional story. It is concluded that the higher rate of recall is positively associated with the cooperative condition in all groups except the heterogeneous group. (English summary) (33 ref)—S. Choe.

2999. Marks, Michael W. & Vestre, Norris D. (Washington State U) **Self-perception and interpersonal behavior changes in marathon and time-extended encounter groups.** *Journal of Consulting & Clinical Psychology*, 1974(Oct), Vol 42(5), 729-733.—Assigned 27 undergraduates to a time-extended, a marathon group, or a control condition to evaluate the effects of encounter experiences on self-perception and interpersonal behavior. The Personal Orientation Inventory and the Interpersonal Check List were administered before the group experience, the day after, and again 8 wks later. Both experimental groups showed significantly greater changes in self-perceptions from pretest to posttest than the control group. No between-group differences were found on follow-up. Ratings made by each S's "significant other" indicated no between-group differences. (26 ref)—*Journal abstract.*

3000. Morris, Kenneth T. & Cinnamon, Kenneth M. (Central Michigan U, Counseling Ctr) **A handbook of verbal group exercises.** Springfield, IL: Charles C Thomas, 1974. xx, 347 p.—Uses an encyclopedic system to list, alphabetically, the goals and purposes of exercises aimed at expanding growth and communication possibilities within the group. Among the exercises included are those in coping, empathy, awareness, listening, perception, rejection, problem solving, self-concept, and self-disclosure.

3001. Organ, Dennis W. (Indiana U) **Social exchange and psychological reactance in a simulated superior-subordinate relationship.** *Organizational Behavior & Human Performance*, 1974(Aug), Vol 12(1), 132-142.—Social exchange theory predicts that if a superior confers a social gift on a subordinate, the latter will feel obligated to reciprocate. A salient mode of reciprocation is the compliance with superior's task norms. However, the theory of psychological reactance argues that imposing

an obligation to reciprocate will generate countercompliance if accompanied by other situational variables (e.g., a high degree of surveillance) which threaten the subordinate's range of freedom. In a laboratory experiment using a business simulation task with 52 male undergraduate business majors it was found that under low surveillance, superior's conferral of a social gift (a compliment) led to greater compliance than in a control group (no social gift). However, under high surveillance (operationally defined in terms of the requirement of frequent reporting of task decisions to the superior), subordinates receiving the social gift complied to a lesser extent than the control group.—*Journal abstract.*

3002. Peters, Richard S. (U London, Inst of Education, England) **Personal understanding and personal relationships.** In T. Mischel (Ed), *Understanding other persons.* Totowa, NJ: Rowman and Littlefield, 1974. xv, 266 p.—Examines the extent to which entering into personal relationships with others is constitutive of, rather than just providing conditions for, knowing and understanding them. The concept of "personal relationships" is explored, and it is suggested that there are levels of personal relationships which are connected with levels of personal understanding and personal attraction. (19 ref)

3003. Soble, Sharon L. & Strickland, Lloyd H. (Carleton U, Ottawa, Ontario, Canada) **Physical stigma, interaction, and compliance.** *Bulletin of the Psychonomic Society*, 1974(Aug), Vol 4(2-B), 130-132.—A female student attempted to arrange interviews with 116 middle-class housewives. For half the requests, she appeared physically normal; for the rest she appeared to have a deformed back. Half of the requests were for subsequent interviews with herself; for the other half, she requested subsequent interviews with a different interviewer. As expected, compliance was low when the stigmatized stimulus person attempted to arrange a future interview with herself; but contrary to expectation, compliance was not appreciably higher than in control conditions when the stigmatized person attempted to arrange the interview with a physically normal interviewer. Results are discussed in terms of the "potency" of different types of physical stigma.—*Journal abstract.*

3004. Taylor, Milton H. (Limestone Coll) **Encounter-tapes for personal growth groups.** *Western Carolina University Journal of Education*, 1974(Spr), Vol 6(1), 16-19.—Reviews *Encounter-tapes*, a program of interpersonal exercises for 8-10 people for 10 sessions of 1½ hrs each on a set of audiotape recordings. The trainer's major role is the development of ground rules to focus on individual strengths. Coordinator's manual recommends that individuals in therapy or having emotional difficulties should not participate. The greatest liability is considered to be the lack of separation of effects of tape content from effects of personal interaction. Professionals using *Encounter-tapes* should not expect global growth, since the effectiveness of the tapes as a supplementary or substitute resource has not been established.—*J. Joesting.*

3005. Tedeschi, James T.; Smith, R. Bob & Brown, Robert C. (State U New York, Albany) **A reinterpretation of research on aggression.** *Psychological Bulletin*, 1974(Sep), Vol 81(9), 540-562.—The concept of aggression

is examined and found to be an inadequate way to describe or classify human behaviors. An alternative way of classifying harm-doing behaviors is presented in terms of coercive power. A reinterpretation of the distinctions made by various theories of aggression is offered and applied to research findings. The social-psychological perspective offered suggests specific research questions and generates a series of new hypotheses for investigation. The conditions that lead observers to label actors as aggressive are proposed, and the implications of this label on the subsequent behaviors of observers and actors are explored. (98 ref)—*Journal abstract.*

3006. Weitzenhoffer, André M. (VA Hosp, Oklahoma City, OK) **When is an "instruction" an "instruction"?** *International Journal of Clinical & Experimental Hypnosis*, 1974(Jul), Vol 22(3), 258-269.—In the course of validating with 100 undergraduate Ss the concept of a "classical suggestion-effect" (i.e., the existence of a class of nonvoluntary behaviors elicited by communications intended to serve as traditional "suggestions"), evidence was incidentally obtained showing that many "instructions" given to presumably hypnotized Ss also function like "suggestions." In these circumstances it is not possible to state *a priori* that a verbal communication will function as an "instruction" rather than as a "suggestion." Such a statement can be made with certainty only *a posteriori*, on the basis of the nature of the resulting behavior. The implications of this finding for research and for the clinical uses of hypnotic suggestion are discussed. (German, French & Spanish summaries)—*Journal abstract.*

### Social Perception & Motivation & Attitudes

3007. Baron, Robert S.; Roper, Gard & Baron, Penny H. (U Iowa) **Group discussion and the stingy shift.** *Journal of Personality & Social Psychology*, 1974(Oct), Vol 30(4), 538-545.—The cultural value explanation of the risky shift predicts that group decisions should generally advocate more socially desirable action than previous individual decisions even when the decisions in question do not involve the risk-caution dimension. In addition, this theory holds that this "social desirability" shift should be maintained on individual decisions that follow the group decision. These predictions were tested by comparing group and individual decisions by 99 female undergraduates concerning donations to the Iowa Bengali Relief Committee. Contrary to these predictions, group decisions were significantly less generous than individual decisions despite the fact that Ss indicated that they felt generosity to be socially desirable. Moreover, this effect obtained regardless of whether the individual decision preceded or followed the group decision. Explanations for this outcome involving responsibility diffusion and reluctance to coerce others to emit costly responses were considered. (24 ref)—*Journal abstract.*

3008. Berger, Charles R. (Northwestern U) **Task performance and attributional communication as determinants of interpersonal attraction.** *Speech Monographs*, 1973(Nov), Vol 40(4), 280-286.—Investigated the relationship between task performance, attribution of success or failure to ability or luck, and interpersonal attraction to an external attributor. 141 high school

students were divided randomly into 2 groups, solving possible and impossible anagrams respectively. Ss evaluated their own performance, and were invited to attribute success or failure to either ability or luck. Their performance was also evaluated by a fictitious partner, who attributed it randomly to either ability or luck. Ss indicated agreement or disagreement with the partner, and also completed a measure of interpersonal attraction to the partner. Results show that Ss attributed their own success to ability, and their own failure to bad luck, although the latter attribution was less strong than the former. Attraction to the partner was greatest when there was agreement in attribution, particularly when the attribution concerned ability.—C. A. Sherrard.

3009. **Bickman, Leonard.** (Smith Coll) **The social power of a uniform.** *Journal of Applied Social Psychology*, 1974(Jan-Mar), Vol 4(1), 47-61.—Investigated the degree and basis of social power of uniformed figures in 2 field experiments. In Exp I, 153 adult Ss were stopped in the street by an E dressed in one of 3 ways: as a civilian, a milkman, or a guard. Ss were asked to pick up a paper bag, or to give a dime to a stranger, or to move away from a bus stop. Results indicate that the Ss complied more with the guard than with the civilian or milkman. 48 Ss in Exp II, which was designed to examine the basis of the guard's power, were asked to give a dime to a stranger under conditions of either surveillance or nonsurveillance. Results show that the guard's power was not affected by the surveillance manipulation. A logical analysis of social power indicated that the guard's power was most likely based on legitimacy. 2 questionnaire studies indicated, however, that college students did not perceive the guard as having either more power or more legitimacy than the milkman or civilian. The nature and importance of understanding legitimacy is discussed. (24 ref)—*Journal abstract*.

3010. **Burnstein, Eugene; Vinokur, Amiram & Pichevin, Marie-France.** (U Michigan) **What do differences between own, admired, and attributed choices have to do with group induced shifts in choice.** *Journal of Experimental Social Psychology*, 1974(Sep), Vol 10(5), 428-443.—Conducted 2 experiments with a total of 122 female undergraduates to study 2 discrepancies considered to be important evidence in support of interpersonal comparison (value-adherence) explanations of group induced shifts in choice: (a) the differences between a person's own choice and the choice he predicts others would make and (b) the difference between the former and the choice he admires. Items from the Choice Dilemma Questionnaire were used in both experiments. Results of Exp I indicate that own choices are more extreme than those a person predicts others would make because he is more certain and confident about the former than the latter. Exp II strongly suggests that the extreme choices are admired because they imply that the person's solution to a problem involving choice is well-founded and that he has persuasive reasons for the choice. On the whole, evidence supports explanations of choice-shift effects based on persuasive argumentation rather than on interpersonal comparison processes. (35 ref)—*Journal abstract*.

3011. **Calder, Bobby J.; Insko, Chester A. & Yandell, Ben.** (U Illinois) **The relation of cognitive and memorial**

**processes to persuasion in a simulated jury trial.** *Journal of Applied Social Psychology*, 1974(Jan-Mar), Vol 4(1), 62-93.—Investigated in 4 experiments the dependence of persuasion on cognitive factors. All experiments employed a court case for which 795 Ss acted as jury members, reading summaries of both the prosecution's and defense's testimony. The amount of objective information on both sides of the case was varied. Persuasion was a position function of the number of prosecution arguments and the number of defense arguments. This finding was extended by obtaining measures of the Ss' cognitive reactions to the case as well as their opinions, and by following both of these measures over time. Both analysis of variance and multiple regression techniques showed that Ss could have derived their opinions from their cognitions about the case. This relationship also held up over time. Results suggest the general form of an information-processing theory of persuasion. One prediction of this theory is for an asymptotic function relating objective information to persuasion. This prediction received empirical support. (40 ref)—*Journal abstract*.

3012. **Carli, Renzo & Guerra, Giovanni.** (U Cattolica del Sacro Cuore, Facoltà di Medicina e Chirurgia, Milan, Italy) **[Cognitive style and interpersonal perception.]** (Ital) *Archivio di Psicologia, Neurologia e Psichiatria*, 1974(Jan), Vol 35(1), 7-25.—Small groups of Ss played the Prisoner's Dilemma game. Field-dependent Ss showed a significantly higher interpersonal distance than field-independent Ss. The role of cognitive differentiation in field dependence-independence is discussed.

3013. **Chapko, Michael K. & Solomon, Henry.** (Bowdoin Coll) **The cross-situational validity of risk as a value.** *Memory & Cognition*, 1974(Jul), Vol 2(3), 497-500.—Notes that demand characteristics and risk are confounded on the choice dilemma items. Thus, it is difficult using that instrument to determine if individuals view themselves as more risky than others because of a cultural value of risk or instructional demand characteristics. The present study asked 226 college students to make judgments for themselves and for others on either the choice dilemmas (with risk-oriented or risk-neutral instructions) or on 1 of 3 other measures of risk taking (behavior prediction scale, risk of aversive consequences, or zero expected value bets) which have exhibited the risky shift but do not have the instructional problems of the choice dilemmas. Only on the choice dilemmas did Ss view themselves as being more risky. On all other measures Ss viewed themselves as either equal to or more conservative than others. Results cast on the validity of value-type theories as general explanations for the risky shift. (20 ref)—*Journal abstract*.

3014. **Diggins, Dean.** (Brooklyn Coll, City U New York) **The role of social and nonsocial traits in interpersonal attraction.** *Journal of Personality*, 1974(Sep), Vol 42(3), 345-359.—60 male and 60 female undergraduates completed a questionnaire including a free description of 2 people known to the Ss—one liked and one disliked; a trait questionnaire involving 2 hypothetical persons—one liked and one disliked; and a value survey in which Ss rank ordered 6 social and 6 nonsocial values according to importance in their lives. Ss indicated which traits were most important as

determinants of likability and dislikability and their responses were coded into social and nonsocial traits. Results indicate that social traits were (a) in the free descriptions, more important than nonsocial traits in determining both likability and dislikability of a stimulus person; (b) in the trait questionnaire, more important than nonsocial traits in determining dislikability, but more important for females only as determinants of likability; (c) in both measures, more important as determinants of both likability and dislikability for females than for males; (d) affected by the value systems of the subjects; and (e) influenced by the situation, with a social situation yielding greater preference for social traits as determinants of likability and dislikability than a task condition. (23 ref)—*Journal summary*.

3015. Dion, Karen K. (U Toronto, Ontario, Canada) **Children's physical attractiveness and sex as determinants of adult punitiveness.** *Developmental Psychology*, 1974(Sep), Vol 10(5), 772-778.—Investigated a child's physical attractiveness and sex as potential elicitors of differential adult punitiveness. Ss in Exps I and II were 52 white females and 44 white males, respectively. Ss in both groups viewed a videotaped interaction between the E and a child who was made to appear either physically attractive or unattractive. Subsequently, Ss monitored what was presumably the child's performance on a picture-matching task and administered penalties to the child for incorrect responses. The specific penalty involved taking 1-5 pennies away from the child for each error. Results show that women behaved more leniently towards an attractive boy than towards either an attractive girl or an unattractive boy; these results were interpreted in the context of a cross-sex leniency effect mediated by a child's physical attractiveness. Men were not influenced in administering penalties by either a child's attractiveness or sex. It is suggested that the data reflect differences in men's and women's orientations toward children's task behavior. (23 ref)—*Journal abstract*.

3016. Dutton, Donald G. & Aron, Arthur P. (U British Columbia, Vancouver, Canada) **Some evidence for heightened sexual attraction under conditions of high anxiety.** *Journal of Personality & Social Psychology*, 1974(Oct), Vol 30(4), 510-517.—85 male passersby were contacted either on a fear-arousing suspension bridge or a non-fear-arousing bridge by an attractive female interviewer who asked them to fill out questionnaires containing Thematic Apperception Test (TAT) pictures. Sexual content of stories written by Ss on the fear-arousing bridge and tendency of these Ss to attempt postexperimental contact with the interviewer were both significantly greater. No significant differences between bridges were obtained on either measure for Ss contacted by a male interviewer. A 2nd study using 34 males involved a similar field setting and attempted to clarify findings of Study 1. A 3rd study in a laboratory setting manipulated anticipated shock to 80 male undergraduates and an attractive female confederate independently. Anticipation of own shock but not anticipation of shock to confederate increased sexual imagery scores on the TAT and attraction to the confederate. (26 ref)—*Journal abstract*.

3017. Farrell, Ronald A. & Morriene, Thomas J. (State U New York, Albany) **Social interaction and stereotypic responses to homosexuals.** *Archives of Sexual Behavior*, 1974(Sep), Vol 3(5), 425-442.—Studied variations in societal responses perceived by male homosexuals in different group interactions and the relationship of these responses to social status and related behavioral characteristics. Data from 148 male homosexuals in a large midwestern city indicate that (a) stereotypic responses are more likely to occur under the interactional prescriptions characteristic of secondary groups due to the impersonal and almost "one-way" interaction which characterizes them, and (b) lower-class homosexuals are more likely to perceive stereotypic responses because of their closer approximation to the stereotypic image of the homosexual. Behavior which closely approximates the stereotype may be a manifestation of the lower-class homosexual's desire to be clearly identified with the homosexual community and to conform to the sex-role stereotypic expectations of the lower classes. (33 ref)—*Journal abstract*.

3018. Friend, Ronald M. & Vinson, Michael. (State U New York, Stony Brook) **Leaning over backwards: Jurors' responses to defendants' attractiveness.** *Journal of Communication*, 1974(Sum), Vol 24(3), 124-129.—Studied the effects of appearance and personality of a defendant on the sentence given by jurors. It was hypothesized that judges or jurors, in their attempt to be impartial, overcompensate for their biases thereby being partial in the opposite direction. 102 male undergraduates completed the Authoritarian Aggression, Authoritarian Submission, and Power and Toughness subscales of the California F Scale. 3 groups of Ss were then formed to judge an attractive defendant, neutral defendant, and an unattractive defendant. Ss high on the combined Aggression scales sentenced the defendant to twice as many years. Results support the hypothesis—the mean sentence for the attractive condition was 8.40 yrs while it was 5.48 for the unattractive condition.—P. Federman.

3019. Glesne, Martin & Hendrick, Clyde. (Kent State U) **Effects of false positive and negative arousal feedback on persuasion.** *Journal of Personality & Social Psychology*, 1974(Oct), Vol 30(4), 449-457.—Conducted 2 experiments to test the hypothesis that false feedback of high arousal, whether labeled as affectively positive or negative, enhances persuasion. In Exp I with 100 female undergraduates, the affective label attributed to the arousal state was manipulated by instructions describing the arousal Ss experienced as either "pleasant" or "unpleasant." Arousal intensity was manipulated by presenting either "high" or "low" false physiological feedback to Ss while they listened to a communication. Feedback of high arousal enhanced persuasion, and this relationship was not influenced by the affective label attributed to the arousal state. In Exp II with 149 female undergraduates, 1 group was given low-fear feedback, and 2 groups were given high-fear feedback during a warm-up period. During the communication, feedback remained low for the low-fear warm-up group, remained high for 1 high-fear warm-up group, and was reduced to low for the 2nd high-fear warm-up group. Results show that Ss were more persuaded when they received high-

than low-arousal feedback during the communication, and this was true even though they differentially attributed the cause of their arousal. (17 ref)—*Journal abstract.*

3020. Gormly, Anne V. (Trenton State Coll) **Recall of attitudinal and value belief statements in interpersonal judgment tasks.** *Bulletin of the Psychonomic Society*, 1974(Aug), Vol 4(2-A), 102-104.—Investigated theoretical distinctions between attitude and value statements in 216 undergraduates, using 2 interpersonal-judgment situations. Recall of attitude and value beliefs and the effect of similarity of views on attraction were of interest. Predictions from M. Rokeach's 1968 belief centrality theory suggested the saliency of value beliefs over attitude beliefs in judgment settings. In Study 1, Ss were given booklets, attributed to a bogus stranger, which contained either attitude or value statements. The responses to the statements were manipulated to agree or disagree with the Ss' opinion, using 1 of 3 levels of similarity (25, 50, or 75% agreement). Ss tended to have better recall of value topics. Attitude statements, however, were rated as being more useful in making judgments about the bogus stranger. There was a significant effect for level of similarity on the attraction measures ( $p < .005$ ). In Study 2 Ss met an accomplice face to face and exchanged either attitude or value statements. This similarity of the accomplice and S was 1 of 4 levels (0, 33, 67, or 100% agreement). Attitude statements were more useful than value beliefs, and recall data favored value statements ( $p < .05$ ). There was a significant similarity effect for attraction measures.—*Journal abstract.*

3021. Greever, Kathryn B.; Tseng, M. S. & Friedland, B. Udelle. (West Virginia U) **Measuring change in social interest in community college freshmen.** *Individual Psychologist*, 1974(May), Vol 11(1), 4-6.—Administered the Social Interest Index (SII) and the California Psychological Inventory to 344 community college students and 26 4-yr college students to measure the change in social interest after 1 semester. Results show that women scored higher than men on social interest, and social interest changed significantly for men over the semester.

3022. Hamilton, David L. & Fallot, Roger D. (Yale U) **Information salience as a weighting factor in impression formation.** *Journal of Personality & Social Psychology*, 1974(Oct), Vol 30(4), 444-448.—Used the concept of information salience to represent the extent to which the content of a stimulus attribute has implications for the judgment being made. In an experiment with 36 male undergraduates, information salience was manipulated by varying the content of person descriptions in terms of the social and intellectual desirability dimensions reported by S. Rosenberg et al (see PA, Vol 42:17150), which were hypothesized to have differential relevance to judgments of liking and respect. Results substantiate the importance of this concept in that social dimension information had greater influence on liking judgments, while intellectual dimension attributes had more influence on judgments of respect. Implications of these findings for a weighted averaging model of information integration are discussed. (16 ref)—*Journal abstract.*

3023. Harvey, John H. & Jellison, Jerald M. (Vanderbilt U) **Determinants of perceived choice, number of**

**options, and perceived time in making a selection.** *Memory & Cognition*, 1974(Jul), Vol 2(3), 539-544.—Asked 84 college students to make a selection from a set of options which varied in numerosity. After making their selection, Ss were given information which varied their perception of time in making the selection. As predicted, perceived choice was greater (a) the greater the number of options when S perceived that he had taken a relatively short time; (b) if the selection involved a moderately large number of options than if it involved either a small or a very large number when S perceived that he had taken a relatively long time; and (c) the longer the time S thought he had taken, except when the selection involved a very large number of options—in which case, perceived choice was greater the shorter the perceived time. Results provide evidence about the relationship between perceived choice and perceived competence.—*Journal abstract.*

3024. Hayakawa, Tsuguyo. [The effect of inequity upon distributing behavior of children.] (Japn) *Japanese Journal of Educational Psychology*, 1972(Sep), Vol 20(3), 162-169.—Exposed 39 5-yr-old children to different 2-person game-playing situations where E controlled the equity or inequity of reward distribution in the 1st game. In the 2nd game Ss were allowed to distribute rewards by themselves. Results partially support inequity theory. Ss who received less reward from the E than their partners compensated by rewarding themselves generously in Game 2, and partners who received equal reward maintained this equity. However, Ss who were given more reward than their partners tended to maintain this inequity in Game 2 rather than compensating by giving their partner more reward. (English summary)—S. Choe

3025. House, William C. (Case Western Reserve U) **Actual and perceived differences in male and female expectancies and minimal goal levels as a function of competition.** *Journal of Personality*, 1974(Sep), Vol 42(3), 493-509.—Investigated the effect of competition on the performance expectancies, confidence, and minimal goal levels (MGL) of 86 female undergraduates as compared to 93 males. In addition, Ss' perceptions of the expectancies, confidence, and MGLs of males and females were investigated. Both males and females performed the experimental task either individually or under competitive conditions. Prior to task performance, all Ss reported performance expectancies, confidence, and MGLs. They also indicated perceptions of the expectancies, confidence, and MGLs of other male and female Ss in the experiment. Results indicate that females in a competitive situation reported lower performance expectancies, confidence, and MGLs than either females working alone or males in a competitive situation. Results also indicate that both males and females perceived males as reporting higher performance expectancies, confidence, and MGLs than females. Results reflect the traditional perception of the feminine role as noncompetitive, with the resultant avoidance of the appearance of competition on the part of females. (17 ref)—*Journal summary.*

3026. Jellison, Jerald M. & Ickes, William J. (U Southern California) **The power of the glance: Desire to see and be seen in cooperative and competitive situations.** *Journal of Experimental Social Psychology*.

1974(Sep). Vol 10(5), 444-450.—Tested F. Heider's 1958 suggestion that perception increases control and power over that which is perceived. 48 male undergraduates were given the expectation that they would be either cooperating or competing with another person in a game. 24 Ss were led to believe they would be interviewing their partner or opponent before the game, and 24 expected to be interviewed. Ss who expected to interview the other could choose whether to see the other person through a one-way mirror. Ss who expected to be interviewed could choose whether they wanted to be seen by the other. As predicted, the tendency to choose to allow perception was strong in all conditions except the condition in which Ss expected to compete with the other and might be seen by him.—*Journal abstract*.

3027. Kanekar, Suresh. (U Bombay, India) **Contiguity with versus instrumentality of reinforcement as a condition for liking: A theoretical note.** *Psychologia: An International Journal of Psychology in the Orient*, 1974(Mar), Vol 17(1), 25-27.—Discusses the relative potency of contiguity with reinforcement as opposed to instrumentality of reinforcement. Contiguity should be more potent than instrumentality for younger children who have a limited symbolic mediational apparatus. It is suggested that even when instrumentality is effective by itself, this is because it involves symbolic contiguity.

3028. Kaplan, Martin F. & Kemmerick, Gwen D. (Northern Illinois U) **Juror judgment as information integration: Combining evidential and nonevidential information.** *Journal of Personality & Social Psychology*, 1974(Oct), Vol 30(4), 493-499.—96 undergraduates who simulated jurors gave guiltiness and punishment ratings for 8 traffic felony cases that varied in level of incrimination depicted by the evidence (high or low) and defendant characterization (positive, neutral, negative, or none). Judgment was an additive function of both types of information. Relative importance of characterizations for ratings was unaffected by instructions that varied their utility as guilt indicators. It is suggested that forming a juror judgment requires the integration of information. Results suggest that the conceptual approach and integration rules commonly applied to the impression formation task are equally applicable to juror judgment. Information components, whether legally relevant or not, have both scale value and weight for the judgment, and the juror then integrates these values into a unitary evaluation. (22 ref)—*Journal abstract*.

3029. Kawagishi, Hiroe. [A study of self-acceptance and acceptance of others with accent on measures of acceptance.] (Japn) *Japanese Journal of Educational Psychology*, 1972(Sep), Vol 20(3), 170-178.—60 male and 81 female college students were given descriptions of personality characteristics and were asked to rate themselves on each characteristic in terms of self-satisfaction, private acceptance, and social acceptance. Correlational analysis of the 3 variables on the basis of responses to the 141 personality adjectives revealed that social acceptance was the purest measure of acceptance, and each adjective was given a scale value of social acceptance. Ss were then asked to rate a male and female stranger on each adjective to determine acceptance of others. Results indicate that self-acceptance and acceptance of others were significantly correlated ( $p < .01$ )

when both sexes were combined and when one sex viewed the same sex. Adjustment scores and self-acceptance were also positively correlated. (English summary) (19 ref)—S. Choe.

3030. Keesey, Charles B. (U Nebraska, Lincoln) **The influence of opinion agreement and quality of supportive reasoning in the evaluation of moral judgments.** *Journal of Personality & Social Psychology*, 1974(Oct), Vol 30(4), 477-482.—Conducted 2 experiments in which a total of 48 6th-grade girls and 48 female undergraduates rated responses to Kohlberg-type moral dilemmas. These responses (moral judgments) consisted of (a) an opinion as to how the dilemma should be resolved and (b) moral reasoning at various Kohlberg stages that supported the opinion. Ratings were influenced not only by whether the opinion advocated in the moral judgment agreed or disagreed with the S's own opinion but also by the stage of supportive reasoning. The greater relative influence of opinion agreement over stage of supportive reasoning was more pronounced among preadolescent Ss. This age difference and the overall process of evaluating moral judgments are explained in terms of the mental operations composing Piaget's cognitive-developmental stage of formal operations. (18 ref)—*Journal abstract*.

3031. Lashbrook, William B. & Sullivan, Jean. (West Virginia U) **Apathetic and neutral audiences: More on simulation and validation.** *Speech Monographs*, 1973(Nov), Vol 40(4), 317-321.—Replicated and extended a computer-simulation study by C. Hylton and W. B. Lashbrook (1972) on producing attitude change in neutral and apathetic audiences by means of computer-generated messages. 89 high school students were divided into neutral and apathetic groups, according to their responses on the Fischbein and Raven AB Scales to an issue "Student Evaluation of Teachers for the Purpose of Tenure." Subgroups of neutrals and apathetics received either neutrally-oriented, apathetically-oriented, or control (nil) messages. The messages were determined by the computer program ARISTOTLE, using simulated audiences, prepared issues, and estimated degrees of required evidence as parameters. The program prediction that apathetically-oriented and neutrally-oriented messages would produce significant attitude change in the appropriated groups was upheld. In addition, the apathetic group was persuaded by both apathetically-oriented and neutrally-oriented messages.—C. A. Sherrard.

3032. Lindskold, Sverre et al. (Ohio U) **The perception of individual and group stability.** *Journal of Social Psychology*, 1974(Aug), Vol 93(2), 211-218.—104 male and female undergraduates predicted the likelihood that groups or individuals would act in a manner consistent with their past actions. Predictions were made for 20 hypothetical situations. With both within-S and between-S analyses, the hypothesis that more stability would be attributed to groups than to individuals was confirmed. Social-learning, attributional, and balance-theory explanations are proposed. Unexpectedly, females perceived less stability in either groups or individuals than did males in 3 separate analyses. (18 ref)—*Journal abstract*.

3033. McGinnies, Elliott & Ward, Charles D. (American U) **Persuasibility as a function of source credibility and locus of control: Five cross cultural experiments.**

*Journal of Personality*, 1974(Sep), Vol 42(3), 360-371.—A total of 702 Australian, Japanese, Swedish, US, and New Zealand university students read an argument advocating the extension of international maritime boundaries. For some Ss the message was attributed to a highly credible communicator and for others to a much less credible communicator. The belief of the Ss in internal vs external locus of control was measured with Rotter's Internal-External Control Scale and used to predict attitude change under the 2 source conditions. A significant interaction was found between Source Credibility I-E Score, and Nationality. Previous findings of a Credibility  $\times$  I-E Score interaction among American Ss were replicated; however, no such relationship obtained in the Japanese, Swedish, and New Zealand Ss, and a significant reversal of the American effect appeared in the Australians.—*Journal summary*.

3034. Munson, Paul & Kiesler, Charles A. (U Kansas) **The role of attributions by others in the acceptance of persuasive communications.** *Journal of Personality*, 1974(Sep), Vol 42(3), 453-466.—Explored the question of Os communicating their attribution to actors. A total of 259 university students served as Ss. A confederate attributed an attitude to the S which was congruent with the S's true opinion, mildly discrepant, or quite discrepant. A control group with no attribution was also included. Independently of the attribution dimension, half of the Ss subsequently read a counter-communication on the issue. Attribution and attack each produced significant effects, but without statistical interaction. It is concluded that attributions by others have an independent persuasive effect on their own.—*Journal summary*.

3035. Newton, Darren. (U Virginia) **Dispositional inference from effects of actions: Effects chosen and effects forgone.** *Journal of Experimental Social Psychology*, 1974(Sep), Vol 10(5), 489-496.—146 undergraduates made comparative judgments as to which of 2 hypothetical actors they were most confident possessed a choice-related trait, and which was most extreme on that trait dimension. Each actor was portrayed as making a choice from a set of actions; the choice sets varied independently in the number of effects eliminated by the choice and in the number of effects remaining after choice. Results confirm the 1965 hypothesis of E. E. Jones and K. E. Davis that correspondence would be inversely related to the number of effects remaining after choice. In addition, correspondence was directly related to number of effects eliminated by the choice when effects remaining did not differ. When given both sources of information, Ss preferred to use information from effects remaining.—*Journal abstract*.

3036. Nickel, Ted W. (U Tulsa) **The attribution of intention as a critical factor in the relation between frustration and aggression.** *Journal of Personality*, 1974(Sep), Vol 42(3), 482-492.—The perception of the intentionality of aggression (electric shock), together with either a low or high amount of that shock, was manipulated in an experiment with 56 paid male college students. Ss worked in pairs such that each S believed that his partner was administering the shock received. The amount of shock Ss believed their partner intended them to receive produced a greater difference in the Ss' behavior when they were given the chance to retaliate,

than did the shock which they actually received. Ss who received low shocks, but were led to believe that high shocks had been intended, retaliated with high shocks. Measures of affect as well as a simulation of the experiment confirmed the behavioral measures. Ss who had received high shocks, who were subsequently told that low shocks had been intended, were given the opportunity to react hostilely to a person other than their partner. There was no indication that they displaced their hostility on this person. Results support the utility of employing cognitive constructs when studying aggressive behavior.—*Journal summary*.

3037. O'Connell, Walter E. (VA Hosp, Houston, TX) **Receptivity toward dreikurisms.** *Individual Psychologist*, 1974(May), Vol 11(1), 22-23.—Presents the results of the agreements and disagreements of 46 college students unfamiliar with Adlerian premises when given a true-false test of 159 aphorisms by R. Dreikurs. Results indicate that (a) Ss agreed with items which did not seem to contradict cultural slogans and disagreed with those that pointed out subtle parent-child maneuverings and (b) females appeared to be more attuned to the here-and-now purposes of misbehavior and the interactional quality of life.

3038. Page, Monte M. (U Nebraska, Lincoln) **Demand characteristics and the classical conditioning of attitudes experiment.** *Journal of Personality & Social Psychology*, 1974(Oct), Vol 30(4), 468-476.—Tested implications of a demand characteristics interpretation of the attitude conditioning effect in 2 experiments with a total of 150 undergraduates. In the 1st study, half the Ss were told just prior to their dependent variable performance that if they knew how certain syllables were "supposed" to be rated, they were to reverse those ratings to "completely opposite." This resulted in a "mirror image" reversal of the data for this group as compared to the regular group. This reversal was accounted for by aware Ss only. Unaware Ss could not follow the reversal instructions, and they did not show a conditioning-without-awareness effect. In the 2nd study, Ss were instructed to learn the associations between the conditioned stimulus-unconditioned stimulus lists. This resulted in a large increase in the magnitude of the attitude conditioning effect. Both studies are interpreted as making an unconscious conditioning interpretation of this experiment less and less plausible.—*Journal abstract*.

3039. Price, Richard H. & Bouffard, Dennis L. (Indiana U) **Behavioral appropriateness and situational constraint as dimensions of social behavior.** *Journal of Personality & Social Psychology*, 1974(Oct), Vol 30(4), 579-586.—In the 1st of 2 studies, 52 undergraduates were required to judge the appropriateness of 15 behaviors in each of 15 situations in a behavior-situation matrix. Differences among behaviors, situations, and Behavior  $\times$  Situation interactions contributed substantial proportions of the total variance in judgments. The concepts of behavioral appropriateness and situational constraint were offered to account for the differences obtained among behaviors and situations, respectively. A 2nd study, using a new sample of 42 Ss and different methods of measurement, provided initial construct validity evidence for the concepts. Implications of these results for the construction of situational response

hierarchies, the development of behavior and situation taxonomies, and causal attribution are discussed. (35 ref)  
—*Journal abstract.*

3040. **Rosenhan, D. L.; Underwood, Bill & Moore, Bert.** (Stanford U) **Affect moderates self-gratification and altruism.** *Journal of Personality & Social Psychology*, 1974(Oct), Vol 30(4), 546-552.—24 2nd and 3rd graders reminisced on matters that made them happy or sad. Subsequently, they were permitted to indulge themselves noncontingently with candies and to contribute money to other children, both in the absence of the E. Both happy and sad children self-gratified more than the 12 controls, but happy children contributed more than either the controls or unhappy ones. Among happy children, a strong positive correlation was obtained between self-gratification and altruism. Among unhappy children, that correlation was negative. Affect, therefore, moderates the relationship between self-gratification and altruism. (20 ref)—*Journal abstract.*

3041. **Ross, Michael & Thibaut, John.** (U Waterloo, Ontario, Canada) **Determinants of standards of judgment.** *Journal of Personality*, 1974(Sep), Vol 42(3), 383-398.—Conducted 3 experiments in which a total of 140 male undergraduates were presented with stimuli in either ascending order (providing increasing evidence that an artist was good) or descending order. For all 3 experiments, the mean intraseries judgment was more positive in the ascending than in the descending series, an indication of a lower adaptation level (AL) in the ascending series. Following the presentation of the ordered sequence a stimulus of objectively intermediate value (Exps I and II) or reproductions of 2 paintings (Exp III) were shown to the Ss. In Exps I and III the ratings of the postsequence stimulus were lower when it followed the ascending series. In Exp II when the postseries stimulus was made ambiguous by a very brief exposure time it was rated higher following an ascending series than following a descending or random series. Data suggest that a low AL in the early portions of an ascending series produces high judgments which form the basis for high expectations and a high standard of evaluation. (17 ref)—*Journal summary.*

3042. **Rule, Brendan G. & Nesdale, Andrew R.** (U Alberta, Edmonton, Canada) **Differing functions of aggression.** *Journal of Personality*, 1974(Sep), Vol 42(3), 467-481.—Examined the antecedent conditions which affect aggressive responses serving different purposes. 64 male undergraduates taught a peer a list of syllables by punishing errors with immediate shock feedback after each of 3 learning trials. Shock presumably provided such feedback, but increasing its intensity was described as either a help or hindrance to learning. The learner either succeeded or failed and either insulted or did not insult the teacher. Data reveal that the learner's success or failure affected the number of shocks administered depending on whether the aggression was described as a help or a hindrance to learning. When the learner was improving, more shocks were given when they could help him continue to reach his goal but fewer when they served only to inflict pain. Contrary to specific predictions, when the learner was failing, more shocks were given when the shock inflicted pain and fewer when they could help him. When insulted Ss were compared with

noninsulted Ss, the former gave more shock to hurt the victim and less shock to help him learn. (24 ref)—*Journal summary.*

3043. **Salancik, J. R.** (U Illinois) **Inference of one's attitude from behavior recalled under linguistically manipulated cognitive sets.** *Journal of Experimental Social Psychology*, 1974(Sep), Vol 10(5), 415-427.—Tested D. J. Bem's 1972 hypothesis that individuals infer their attitudes from information about their behavior in a given context. 45 undergraduates were asked their attitudes about a course after reporting their behaviors for the course and receiving a linguistic manipulation to produce an intrinsic or extrinsic cognitive context (set). The intrinsic form resulted in a class perceived as more interesting than useful while the extrinsic form resulted in a class perceived as more useful than interesting. Results suggest that Ss' attitudes are derived from information about different behaviors under the 2 cognitive sets. The attitudes of extrinsic set Ss were correlated with behaviors relevant to obtaining course outcomes (contingent behaviors) and uncorrelated with behaviors relevant to personal interest (noncontingent behaviors); the opposite was found for intrinsic set Ss. (18 ref)—*Journal abstract.*

3044. **Sherrod, Drury R. & Downs, Robin.** (Kirkland Coll) **Environmental determinants of altruism: The effects of stimulus overload and perceived control on helping.** *Journal of Experimental Social Psychology*, 1974(Sep), Vol 10(5), 468-479.—Measured the effects of stimulus overload on altruism. 60 female undergraduates were randomly assigned to 3 stimulus conditions of 20 Ss each: overload, overload with perceived control, and no overload. Ss performed simultaneous proofreading and number attention tasks while at the same time listening to distracting or nondistracting background sound, and 1 group believed they could have the sound turned off if they desired. Following task performance, all Ss received a request for a favor from an ostensibly unrelated confederate. Although all Ss performed the tasks about equally well regardless of stimulus condition, altruism increased significantly across the 3 conditions. Results are discussed in terms of stimulus overload associated with the urban environment. (23 ref)—*Journal abstract.*

3045. **Simons, Herbert W.** (Temple U) **The carrot and stick as handmaidens of persuasion in conflict situations.** In G. R. Miller & H. W. Simons (Eds), *Perspectives on communication in social conflict*. Englewood Cliffs, NJ: Prentice-Hall, 1974. xiii, 257 p.—Attempts to determine types of social influence, the means by which influence is exerted in conflict situations, and whether characteristic influence patterns are exhibited by different types of individuals. The idea that in conflict situations, persuasion is not so much an alternative to the power of constraints and inducements as it is an instrument, accompaniment, or a consequence of that power is examined, and implications for the Watergate affair are discussed. (3 p ref)

3046. **Smith, Raymond G.** (Indiana U) **Source credibility context effects.** *Speech Monographs*, 1973(Nov), Vol 40(4), 303-309.—Investigated the influence that speaker characteristics other than source credibility dimensions may have in the formation of listeners' impressions of speaker credibility. Responses

followed a simple information-averaging model in about 80% of listeners. For the remaining 20%, however, there was a significant interaction between traits. This mixed effect suggests caution in interpreting results of credibility studies. It was found further that all positive and negative source credibility dimensions could be treated safely as equal in weight, except for the negative pole of the Trustworthiness dimension; an untrustworthy speaker, regardless of his other qualities, was viewed as a questionable message source.—*Journal abstract.*

3047. Snyder, Mark. (U Minnesota) **Self-monitoring of expressive behavior.** *Journal of Personality & Social Psychology*, 1974(Oct), Vol 30(4), 526-537.—Proposes a social psychological construct of self-monitoring (self-observation and self-control guided by situational cues to social appropriateness) of expressive behavior and self-presentation. An internally consistent, temporally stable self-report measure of individual differences in self-monitoring was constructed. 4 converging laboratory and field studies of peer perception ratings, criterion group membership, self-control of facial and vocal emotional expressive behavior, and attention to normative social comparison information were conducted with undergraduates to demonstrate the convergent and discriminant validity of the Self-Monitoring Scale (SM). The use of SM to investigate hypotheses concerning consistency in expression across situations and between channels of expressive behavior is discussed. (28 ref) —*Journal abstract.*

3048. Snyder, Mark; Grether, John & Keller, Kristine. (U Minnesota) **Staring and compliance: A field experiment on hitchhiking.** *Journal of Applied Social Psychology*, 1974(Apr-Jun), Vol 4(2), 165-170.—Conducted a field experiment in which a single male, a single female, or a male-female couple attempted to hitch rides at 4 different traffic locations, under conditions in which the hitchhikers either stared at or looked away from oncoming drivers. It was found that staring increased the probability of a driver stopping from .03 to .067. The female was a more successful hitchhiker than either the male or the couple.—*Journal abstract.*

3049. Sorrentino, Richard M. & Hardy, Jack E. (U Western Ontario, London, Canada) **Religiousness and derogation of an innocent victim.** *Journal of Personality*, 1974(Sep), Vol 42(3), 372-382.—Forty-two high-religious and 38 low-religious paid university students observed a peer (learner) receive either painful electric shocks (experimental condition) or no shock (control condition) for making errors in a serial learning task. A significant Religiousness  $\times$  Conditions interaction occurred ( $p < .01$ ) such that while the high-religious group gave the learner lower evaluations than the low-religious group in the control condition, the reverse was true in the experimental condition. In interpreting these results, considerable importance is attributed to the fact that the significant interaction was due primarily to the behavior of the low-religious group, as the high-religious group did not differ in their evaluation of the learner across conditions. Data are inconsistent with the general hypothesis that religious persons are less compassionate

than less religious persons. Results suggest, instead, that religious persons may be less sensitive to situational determinants than less religious persons. (21 ref) —*Journal summary.*

3050. Steiner, Ivan D.; Rotermund, Manfred & Talaber, Rudolph. (U Massachusetts, Amherst) **Attribution of choice to a decision maker.** *Journal of Personality & Social Psychology*, 1974(Oct), Vol 30(4), 553-562.—Conducted 3 experiments with 210 undergraduates to test hypotheses generated by a theoretical model that predicts the amount of "real choice" attributed to a decision maker. The model maintains that greatest choice is attributed when available options seem equally attractive. The attractiveness of an option is indexed by the discrepancy between its expected value and the costs that must be incurred in pursuing it. All 3 experiments supported the model, but 2 of them also yielded findings that had not been predicted. Thus, although the discrepancy between expected values and costs emerged as the major determinant of attributed choice, each of these factors had effects that were not completely subsumed by the model. It is concluded that the model tells the truth, but not the whole truth, about the attribution of choice.—*Journal abstract.*

3051. Weaver, Robert A. (Indiana U Pennsylvania) **Peaks and valleys of student experiences.** *Vocational Guidance Quarterly*, 1974(Mar), Vol 22(3), 168-169.—Describes the results of a pilot survey of 35 male junior college students who were asked to write in detail about the 2 most negative experiences and the 2 most positive experiences of their lives. More than  $\frac{1}{2}$  of the negative experiences and more than  $\frac{1}{4}$  of the positive experiences reported were associated with their school situation.

3052. Wilke, H. (Inst of Social & Industrial Psychology, Groningen, Netherlands) **[Polarization.]** (Duth) *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1974(Jun), Vol 29(4), 259-280.—Reviews 4 theories of polarization of attitudes basic to the judgment of social stimuli: G. A. Kelly's construct theory, N. H. Anderson's information-integration theory, H. Tajfel's social categorization approach, and M. Sherif and G. W. Sherif's social judgment-involvement theory. According to the Kelly and Sherif theories, the more extreme the judgment about an important issue, the greater the polarization. According to Anderson and Tajfel, polarization is augmented when the information about an issue is increased to extreme limits. With respect to polarization within a group, many studies question the convergence effect—i.e., the tendency for attitudes within a group to shift to the middle position with additional information. Similarly, an individual's attitudes will become more extreme with greater risk-taking and greater personal involvement in a meaningful issue. The polarization between groups increases with an increasing value set on membership in the ingroup and a corresponding disparagement of the outgroup. (English summary) (91 ref)—A. J. Ter Keurst.

3053. Worchel, Stephen; Insko, Chester A.; Andreoli, Virginia A. & Drachman, David. (U North Carolina) **Attribution of attitude as a function of behavioral direction and freedom: Reactance in the eye of the observer.** *Journal of Experimental Social Psychology*.

1974(Sep). Vol 10(5). 399-414.—Conducted 2 experiments with a total of 140 undergraduates in which an actor-stooge was given free-choice, forced-compliance choice, or no-choice as to whether he should tell the "waiting S" that a task was dull or enjoyable. The actor-stooge also either chose or agreed to inform the "waiting S" that the task was dull or that the task was enjoyable as a manipulation of behavioral direction. Ss made positively correspondent inferences in the free-choice condition (i.e., the actor-stooge was attributed with a more unfavorable attitude toward the task when he chose to advocate the dullness of the task than when he chose to advocate its enjoyableness). However, within the no-choice condition, previously unobtained negative correspondent inference occurred. The actor-stooge was attributed with a more unfavorable attitude toward the task when he advocated the enjoyableness of the task than when he advocated the dullness of the task. Results indicate that Ss attributed reactance to the actor-stooge in the condition in which the most social pressure was exerted. Exp II demonstrated that the negative correspondence effect was not due to assumptions regarding other Ss' preference. The dependence of the effect on the absence of a rationale for the no-choice assignment of behavioral direction was also indicated.—*Journal abstract*.

3054. Ylon, Yoel & Bizman, Aharon. (Bar Ilan U, Ramat-Gan, Israel) **The nature of effective bonds and the degree of personal responsibility as determinants of risk taking for "self and others."** *Bulletin of the Psychonomic Society*, 1974(Aug), Vol 4(2-A), 80-82.—Tested the hypotheses that (a) the nature of affective bonds among group members and (b) the degree of personal responsibility for decisions made for "self and others" are determinants of the level of risk taken in making these decisions. In a field experiment, 90 16-18 yr old males who were residents of a dormitory made decisions in a card game which affected both themselves and 2 others. These triads consisted of Ss who mutually liked each other, were indifferent to each other, and disliked each other. It was found that Ss in the cohesive triads took fewer risks than members of the indifferent or hostile triads. Ss under a personal responsibility condition tended to take fewer risks than did Ss under a group responsibility condition. Contrary to expectation, no interaction was found between the 2 variables. Results are explained in terms of the living circumstances of the Ss.—*Journal abstract*.

3055. Yoshino, Noriko. [Social reinforcement and affiliation: The interpersonal behavior of children: II.] (Japn) *Japanese Journal of Educational Psychology*, 1972(Dec), Vol 20(4), 236-243.—Studied the effect of experimentally controlled social deprivation and satiation on children's receptivity to social reinforcement. In 2 experiments, E's personal attention to 62 children's activities was differentially manipulated. In Exp I, the reinforcement effect was significant ( $p < .05$ ) for the group which received positive attention, as measured by the amount of the experimental task accomplished. In Exp II, the same effect was significant ( $p < .06$ ), as measured by the frequency of the cooperative behavior. (English summary)—*S. Choe*.

## COMMUNICATION AND LANGUAGE

3056. Arnold, William E.; Liddell, Charles & Findling, Janet. (Arizona State U) **Diffusion of information about crisis intervention services.** *Crisis Intervention*, 1974, Vol 5(3), 2-11.—Studied questionnaire responses of crisis-intervention clients to determine effects of mass media and interpersonal communication upon (a) visibility of services, (b) help-seeking motivation, and (c) the extent to which clients tell others about services.

3057. Aronson, Howard I. (U Chicago) **The role of attitudes about languages in the learning of foreign languages.** *Modern Language Journal*, 1973(Nov), Vol 57(7), 323-329.—Describes a set of powerful cultural factors which strongly inhibits the acquisition of an acceptable pronunciation pattern by the learner of a foreign language. The student deliberately avoids the correct intonation, labialization, or other phonological features in the target language because in English, the required pronunciation carries bad connotations (e.g., the hisping needed in Spanish).

3058. Bhat, D. N. (Stanford U, Language Universals Project) **Retroflexion and retraction.** *Journal of Phonetics*, 1974(Jul), Vol 2(3), 233-237.—Demonstrates that retroflexion and retraction are distinct and contrastive and that consonants produced with retroflexion show a number of phonological characteristics that differentiate them from sounds that are produced without it. It is argued that a system of phonetics that does not characterize the retroflexed consonants by their specific articulation would fail to take care of some of their phonological properties.

3059. Bond, Z. S. (U Alberta, Edmonton, Canada) **The perception of sub-phonemic phonetic differences.** *Language & Speech*, 1973(Oct-Dec), Vol 16(4), 351-355.—Tested 10 assumedly homophonous word pairs (e.g., *lax* vs *lacks*) for the ability of 17 untrained undergraduates and 12 graduate phonetics students to identify them. When total scores for each word pair were considered, Ss were unable to identify any of the word pairs correctly at a statistically significant level. However, in the case of some individual productions of the homophone pairs, Ss were extremely consistent in how they labeled the words. The productions which were most consistently labeled were analyzed to determine what acoustic cues the Ss were employing. Apparently, Ss were able to make use of certain acoustic cues that are sometimes considered subphonemic. That these cues are not linguistically significant is indicated by the fact that besides correct identifications, the Ss also produced equally consistent mislabelings.—*Journal abstract*.

3060. Bowers, John W. (U Iowa) **Communication strategies in conflicts between institutions and their clients.** In G. R. Miller & H. W. Simons (Eds), *Perspectives on communication in social conflict*. Englewood Cliffs, NJ: Prentice-Hall, 1974. xiii, 257 p.—Discusses the nature of asymmetrical conflicts (e.g., those involving large, profit-making organizations and relatively powerless clients), the kinds of social control mechanisms available to both the clients and the company, and how these strategies of influence are likely to function in institution-client interactions. A 2-dimensional matrix of communication strategies which can be used to predict

the process of asymmetrical transactions based on 3 variables (perceived probability, reward, and cost) is applied to 2 actual conflicts.

3061. Buchli, Virginia & Pearce, W. Barnett. (Valley City State Coll) **Listening behavior in coorientational states.** *Journal of Communication*, 1974(Sum), Vol 24(3), 62-70.—Studied the factors accounting for differential listening performance using the coorientation model which combines interpersonal and intrapersonal factors of communication behavior. 117 students in a public speaking course served as Ss. Coorientational states were induced between Ss and the judges of 4 legal cases. Ss read the arguments in each case, and recorded their verdict and whether they expected the judge to agree or disagree with their verdict. Ss then listened to a recording of the judge's decision and his reasoning, wrote summaries of the judge's rationale, and were questioned on his statement. Ss were considered to have listened if they correctly identified whether a statement was contained in the judge's rationale. The hypothesis that Ss in different coorientational states would listen differently was confirmed. Those in the predicted-agreement-confirmed state listened less well than those in the other 3 states (predicted-agreement-disconfirmed, predicted-agreement-confirmed, and predicted-disagreement-disconfirmed). It is concluded that the poorest listening is done by those who are told beforehand that the speaker is endorsing a position they believe in. (25 ref)—P. Federman.

3062. Buck, Ross; Miller, Robert E. & Caul, William F. (U Connecticut) **Sex, personality, and physiological variables in the communication of affect via facial expression.** *Journal of Personality & Social Psychology*, 1974(Oct), Vol 30(4), 587-596.—"Senders" viewed 25 emotionally loaded color slides. Their facial expressions were observed via a hidden television camera by "observers" who made judgments about the nature of each slide and the sender's reaction to it. A total of 64 undergraduates were arranged in 8 pairings each of females sending to male observers, females sending to females, males sending to males, and males sending to females. Statistically significant communication was demonstrated, with females being more accurate senders than males. More accurate senders tended to show a smaller skin conductance and heart rate response to the slides and a more "personal" verbal report of their emotional reaction to the slides. Several personality measures were related to communication accuracy and physiological responding (Byrne's Repression-Sensitization scale, Eysenck Personality Inventory Extraversion-Introversion scale, and the Janis and Field self-esteem scale). (18 ref)—*Journal abstract*.

3063. Caplan, David. (McGill U, Medical School, Montreal, Quebec, Canada) **A note on the abstract readings of verbs of perception.** *Cognition*, 1973, Vol 2(3), 269-277.—Describes the linguistic contexts in which certain verbs of perception assume an abstract rather than a concrete meaning. The class of verbs which permit such a reading is defined. This class can be related to neuroanatomical facts, which are themselves related to the human capacity for language. (French summary)

3064. Clynes, Manfred. **The biological basis for sharing emotion: The pure pulse of musical genius.** *Psychology Today*, 1974(Jul), Vol 8(2), 51-55.—Describes the use of "sentic," the scientific study of the communication of emotions, as a means of understanding emotions in music. Emotions are expressed precisely and can be measured. The patterns of the various emotions are identical among musicians, are constant across considerable time periods, and are universal. Sentic provides insights into the process of empathy, since performers must empathize with the emotions of the composer if they are to reproduce music.—E. J. Posavac.

3065. de Gerenday, Lynn. **Play, ritualization, and ambivalence in Julius Caesar.** *Literature & Psychology*, 1974, Vol 24(1), 24-33.—Discusses *Julius Caesar* as it demonstrates the nature of ambivalence. It is suggested, using Freud's interpretation of the play as a springboard, that rhetoric and ceremony, reinforced by an emphasis on play-acting, bind and distance intense love and hostility from conscious expression.

3066. Emanuel, Floyd W. & Smith, Wendell F. (U Oklahoma, Health Services Ctr, Oklahoma City) **Pitch effects on vowel roughness and spectral noise.** *Journal of Phonetics*, 1974(Jul), Vol 2(3), 247-253.—Results of tests with young adult Ss show that mean spectral noise level (SNL) and perceived roughness of the test phonations diminished significantly when vocal pitch was raised by an octave. Roughness ratings and SNL means were more closely related to the relative pitch at which the test phonations were produced than to the absolute fundamental frequency of phonation.

3067. Frentz, Thomas S. (U Southern California) **Toward a resolution of the generative semantics/classical theory controversy: A psycholinguistic analysis of metaphor.** *Quarterly Journal of Speech*, 1974(Apr), Vol 60(2), 125-133.—Tested 2 linguistic theories, the classical theory and generative semantics. 3 psycholinguistic models of metaphor were constructed. 160 undergraduates enrolled in speech courses judged 26 concepts derived from 2 metaphors, rating the concepts on semantic differential scales. 6 multiple regression analyses on the response data were performed, producing multiple correlation coefficients for each of the 3 models. For one of the metaphors, Model 1 predicted significantly better than either of the other models ( $p < .05$ ). Results provide preliminary behavioral support for generative semantics.—H. Ruja.

3068. Giles, Howard. (University Coll, Cardiff, Wales) **Communicative effectiveness as a function of accented speech.** *Speech Monographs*, 1973(Nov), Vol 40(4), 330-331.—Studied the effectiveness of regional accented speech in inducing attitude change. 250 high school students from 2 dialect areas were divided into 10 groups, matched for sex and initial attitude to capital punishment. Each group received 1 of 5 forms of an argument against capital punishment. The argument forms consisted of a taped speech in standard (prestigious) dialect, and 3 speeches in regional dialects of lesser degrees of prestige, all recorded by the same speaker, who kept rate and paralinguistic features constant. A 5th form was written. After stimulus presentation, Ss rated their attitude towards capital punishment, and also the quality of the argument they

had received. The perception of argument quality varied directly with accent prestige, but only the regional accents were effective in inducing attitude change. There were no interactions between Ss and message dialects.

—C. A. Sherrard.

3069. Gold, Bertram & Salkind, William. What do "top box" scores measure? *Journal of Advertising Research*, 1974(Apr), Vol 14(2), 19-23.—Analyses of results of 4 surveys show that ratings of discriminators in the top box (most favorable) indicate that the stimulus was rated more favorably than other stimuli and, by contrast, ratings of nondiscriminators in the top box reflect identical favorable ratings for all stimuli. Varying but significant proportions of nondiscriminator yeasayers contaminate validity of measurement, especially in monadic designs. It is suggested that control of nondiscriminator bias should result in more sensitive research.

—J. C. Franklin.

3070. Goldstein, Louis M. & Lackner, James R. (Brandeis U) Alterations of the phonetic coding of speech sounds during repetition. *Cognition*, 1973, Vol 2(3), 279-297.—Undergraduates who listened to a meaningless syllable that was continually repeated heard the syllable undergo a variety of changes over time. These changes were very systematic and represented alterations in the phonetic coding assigned to an unchanging sound stimulus. The changes appear to involve a reorganization of the phones constituting the syllables. (French summary) (17 ref)

3071. Grieve, Robert. (U St Andrews, Psychological Lab, Scotland) Definiteness in discourse. *Language & Speech*, 1973(Oct-Dec), Vol 16(4), 365-372.—Attempted to relate definiteness to topicalization in 2 experiments with a total of 122 native English-speaking undergraduates. In an utterance with 2 nominals, there is a tendency to distinguish the nominals in the topic from the nominal in the comment by marking the former with *the* and the latter with *a*, for in discourse the speaker must presuppose of his listener knowledge of topic (the + noun) and ignorance of comment (a + noun). However, since this clearly assumes that use of *the* is related to knowledge, and *a* to lack of knowledge, the present study tested these assumptions. Results support the hypotheses.

—Journal abstract.

3072. Grinstein, Alexander. King Lear's impending death. *American Imago*, 1973(Sum), Vol 30(2), 121-141.

—Discusses Shakespeare's *King Lear* as a play that presents not only a man's own reaction to his impending death but also the reactions of his children. It is suggested that the psychological greatness of the play lies in the universality of this subject. (26 ref)—R. S. Albin.

3073. Hagenauer, Fedor & Hamilton, James W. (U Cincinnati, Medical School) "Straw Dogs": Aggression and violence in modern film. *American Imago*, 1973(Fal), Vol 30(3), 221-249.—Discusses some aspects of aggression and violence as presented in Sam Peckinpah's film "Straw Dogs." The adaptation of this film from a novel was made in such a way as to emphasize intrapsychic core conflicts of dependence, oral rage, separation-individuation, and passivity. A psychoanalytic approach to the material reveals definite patterns of highly overdetermined behavior with clearly identifiable genetic components. It offers a more complete understanding of

the story and a more thorough account of the impact of the film. Biographical data on the director is included. The role of violence in human evolution is discussed. (44 ref)—R. S. Albin.

3074. Hoffman, Nancy Y. (St John Fisher Coll) Franz Kafka: His father's son: A study in literary sexuality. *JAMA: Journal of the American Medical Association*, 1974(Sep), Vol 229(12), 1623-1626.—Analyzes Kafka's relationship with his father and the expressions of sexual impotence and anxiety that appear in his work. A 65-page letter written by Kafka to his father in 1919 is discussed in terms of problems in marriage, writing, and inferiority. The themes of father as killer, the crime of uninvolvedness, and victimization of the "little man" are examined in several of his works.

3075. Horvath, Frank S. (Michigan State U, School of Criminal Justice) Verbal and nonverbal clues to truth and deception during polygraph examinations. *Journal of Police Science & Administration*, 1973(Jun), Vol 1(2), 138-152.—Conducted structured interviews with 50 verified truthful and 50 verified lying Ss who subsequently took polygraph tests. 14 questions in the pretest interview provided 3 types of behavioral information about each S: elicited verbal clues, spontaneous verbal clues, and nonverbal clues. Responses from the 2 types of Ss are compared in detail for each of the 3 types of behavior. Results show clearly that the verbal and nonverbal behavior of truthful polygraph Ss differs in significant observable respects from that of lying Ss. It is concluded that behavioral data can provide useful information to supplement polygraph findings in the ultimate diagnosis of truth or deception, but must be checked for agreement with other data.—R. S. Albin.

3076. Houston, Franklin S. & Weiss, Doyle L. (U Missouri, St Louis) An analysis of competitive market behavior. *Journal of Marketing Research*, 1974(May), Vol 11(2), 151-155.—Conducted an empirical study of the movement of competitive market shares. K. S. Palda's 1964 cumulative advertising model was modified to include a price variable and the analysis extended to a multibrand market. The statistical methodology, which recognizes the competitive interdependence of brands studied and uses this interdependence in its estimation procedures, is detailed, and results of its application to a low-cost food item are presented. Data confirm previous evidence that the influences of advertising effects on sales are cumulative over time.—L. Gorsey.

3077. Jacobson, Irving. (State U New York, Upstate Medical Ctr, Syracuse) The child as guilty witness. *Literature & Psychology*, 1974, Vol 24(1), 12-23.—Relates A. Miller's treatment of the child in "I Don't Need You Anymore" to psychologists' belief that a child frequently loses his sense of being at home in the world when he observes an event he feels he should not have seen. Such an action is followed by conflicts, evasions, and guilt. Specific support for the argument is derived from E. Erikson (1963) and E. Neumann (1964).

3078. Jeng, Chung-In; Lai, Mei-Wei & Liu, In-Mao. (National Taiwan U, Taipei, Republic of China) Category norms in Chinese and English from bilingual subjects. *Acta Psychologica Taiwanica*, 1973, Vol 15, 81-153.—Presents complete normative data (in Chinese with English translation) for responses to 54 verbal

categories by Chinese college students. All but 2 categories from US studies by B. H. Cohen et al (1957) and by W. F. Battig and W. E. Montague (1969) were included. Data include all responses given by each S to each category name within 60 sec, and English-word responses within 30 sec to each of 56 categories of norms presented in English.

3079. Kanungo, Rabindra N. & Pang, Sam. (McGill U, Montreal, Quebec, Canada) **Effects of human models on perceived product quality.** *Journal of Applied Psychology*, 1973(Apr), Vol 57(2), 172-178.—Studied the effects of human models in advertisements on the individual's perception of and attitude toward the product. 32 male and 32 female undergraduates were tested under 3 experimental and 1 control conditions for each of 4 different products (car, sofa, TV, and stereo). In the 3 experimental conditions a male, a female, and a male-female pair were used as models. In the control condition the product was presented without any model. Results reveal that the "fittingness" of the models for the product was an important variable in product advertisements. The implications of congruity theories for product advertisements are discussed.—*Journal abstract.*

3080. Kramer, Cheris. (U Illinois) **Women's speech: Separate but unequal?** *Quarterly Journal of Speech*, 1974(Feb), Vol 60(1), 14-24.—Describes a number of research studies of sex differences in speech, most of them inconclusive, and cites various beliefs regarding such differences, most of them folklore and stereotype. Hypotheses underlying these popular beliefs and requiring experimental investigation include: that men do not like women who talk "too much"; that women are more verbose than men, use different adjectives from men, and more frequently use the "tag-question" formation and leave sentences unfinished; that women's declarative sentences contain more qualifiers; that volume and pitch of their speech vary with the situation and the ratio of men and women present; that serious news is not expected from women and hence they are not acceptable as television and radio announcers; that women's speech has syntactic looseness; that their vocabulary is more limited and central; and that they have an "instinctive" shrinking from coarse expressions.—*H. Ruja.*

3081. Lefcowitz, Allan. (US Naval Academy) **Apology: a pro Roger Pryne: A psychological study.** *Literature & Psychology*, 1974, Vol 24(1), 34-44.—Asserts that in Hawthorne's *The Scarlet Letter*, (a) Chillingworth's apparent allegorical function in the novel masks his complex character and motivation, and his "plot" within the work; and (b) Chillingworth's actions reveal his role as an Oedipal child.

3082. Lehiste, Ilse & Meltzer, David. (Ohio State U) **Vowel and speaker identification in natural and synthetic speech.** *Language & Speech*, 1973(Oct-Dec), Vol 16(4), 356-364.—Required 60 listeners with training in the phonetics to identify both the vowel and the sex of the speaker of 10 monophthongal American English vowels. These vowels were produced by a male speaker, a female speaker, and a child. Formant values were read from spectrograms made of these vowels and used for synthesizing the same 30 vowels on a Glace-Holmes synthesizer. A 3rd set of vowels was generated synthetically using formant and fundamental frequency values

reported by G. E. Peterson and H. L. Barney (see PA, Vol 26:6793). Overall speaker identification scores were higher than overall vowel identification scores for both normal speakers and vowels synthesized from measurements; for the Peterson-Barney set, the scores were approximately the same. The highest overall correct score was 88.3%, obtained for the normal male speaker; the lowest correct score was 31.0%, obtained for children's vowels synthesized from measurements.—*Journal abstract.*

3083. Leonard, Laurence B. (Memphis State U) **The roll of intonation in the recall of various linguistic stimuli.** *Language & Speech*, 1973(Oct-Dec), Vol 16(4), 327-335.—Examined the effects of intonation on the recall of normal sentences, anomalous (grammatical but unmeaningful) sentences, anagram (ungrammatical but meaningful) strings, and word lists presented to 96 university speech students. Results indicate that intonation facilitated recall only in the anomalous sentence condition, suggesting that, in such learning situations, intonation may function as an additional component of grammar, rather than as an independent linguistic variable.—*Journal abstract.*

3084. Leroy, David J. & Smith, F. Leslie. (Florida State U) **Perceived ethicality of some TV news production techniques by a sample of Florida legislators.** *Speech Monographs*, 1973(Nov), Vol 40(4), 326-329.—Conducted a pilot study of ethical attitudes of politicians towards TV production techniques in news coverage. An 11-item questionnaire was constructed from class essays on ethicality in journalism by seniors majoring in humanities and mass communication. The questionnaire was sent to 153 members of the Florida legislature, with a response rate of 32% ( $N = 53$ ). Factor analysis of the responses revealed 2 principal factors in the evaluation of TV production techniques. Factor 1, Ethicality, was related particularly to the transposition of film footage in order to create pseudo-events. Factor 2, Judgmental Editing Decisions, mainly concerned film splicing which does not alter the internal statements of the respondent, and simplified narration substituted for complex original speeches. These procedures were not considered unethical. The principal influencing variable in judging ethicality seemed to be the editorial intention; where this appeared to be deceitful, unethicality was perceived.—*C. A. Sherrard.*

3085. MacKay, Donald G. (U California, Los Angeles) **Complexity in output systems: Evidence from behavioral hybrids.** *American Journal of Psychology*, 1973(Dec), Vol 86(4), 785-806.—The speech errors known as synonymic intrusions (e.g., "sotally," an inadvertent combination of initial word "solely" and sequel word "totally" in "He was sotally responsible for that") suggest that 2 or more words can be simultaneously activated, competing for the same position in a sentence. Statistical analysis of 257 such intrusions showed that the intruding word (or phrase) was simpler than the initial one at segment, syllabic, lexical, and 2 syntactic levels. A hierarchic model for the serial production of speech, and more generally for the study of other motor systems, is proposed. (16 ref)—*Journal abstract.*

3086. Marton, Katherin & Rohloff, Albert C. (Baruch Coll, City U New York) **Use one-interview studies with**

care. *Journal of Advertising Research*, 1974(Apr), Vol 14(2), 35-38. States that on-air studies of ad effectiveness with different levels of exposure require a pre-exposure interview and the recognition that the exposure groups are self-selecting. As a result these groups may differ substantially in predisposition to individual brands. It is also observed that single exposure on-air tests of commercials, using only a post interview, can yield different results when testing is done on different programs, or if the predisposition of the test audience increases over time.—J. C. Franklin.

3087. McEwen, William J. (U Connecticut, Communications Div) **Evaluating media campaigns: Using drug images to assess anti-drug abuse information.** *Drug Forum*, 1974(Spr), Vol 3(3), 283-293.—Reports results of a series of investigations aimed at identifying and assessing the major components of audience response to drug-relevant communications. Analysis of student reactions to antiabuse messages suggested a set of measures which provide sensitive indices of receiver perceptions of the message, the drug(s) discussed, and the type of drug user image depicted.

3088. Mortensen, C. David. (U Wisconsin, Madison) **A transactional paradigm of verbalized social conflict.** In G. R. Miller & H. W. Simons (Eds), *Perspectives on communication in social conflict*. Englewood Cliffs, NJ: Prentice-Hall, 1974. xiii, 257 p.—Describes the methodological substantive assumptions and propositions of a transactional paradigm of social conflict behavior. Behavioral requirements of such a paradigm are discussed (e.g., intensity, affect, and orientation), and an application of the paradigm to high and low conflict issues (the case of Lt. William Calley and the legalization of marijuana) is presented. (54 ref)

3089. Mulac, Anthony & Sherman, A. Robert. (U California, Lab for Quantitative Research in Speech, Santa Barbara) **Behavioral assessment of speech anxiety.** *Quarterly Journal of Speech*, 1974(Apr), Vol 60(2), 134-143.—Reports the development and evaluation of an instrument for the behavioral assessment of speech anxiety. From a preliminary list of 32 behavioral variables, a rating scale of 18 items was constructed. 12 graduate and undergraduate students majoring in speech or psychology received 3 hrs of training in assessing speech anxiety, after which they rated 4 1-min videotaped segments from 5 speeches delivered by 40 males at the beginning and end of a 10-wk introductory speech course. The raters assigned weights to the variables. Reliability of these weightings was measured by correlating them with weightings by expert judges ( $r = .89$ ). Reliability of the ratings of the speech segments was determined by the Ebel intra-class method ( $r = .95$ ). Validity was measured by correlating the total weighted scores assigned by the 12 judges with the overall anxiety scores assigned to the same speeches by 18 expert judges ( $r = .88$ ), by predicting progress in reducing anxiety and verifying the predictions ( $p < .03$ ), and by utilizing varimax rotation to produce an orthogonal factor structure. Factor analysis of the scores on the 18 variables generated 4 independent factors which accounted for 50.3% of the total variance: Rigidity, Inhibition, Disfluency, and Agitation.—H. Ruja.

3090. Neumarkt, Paul. Hartmann von Aue: The psychologism of a medieval poet. *American Imago*, 1973(Sum), Vol 30(2), 157-176.—Presents an analysis of Hartmann von Aue's work *Der arme Heinrich*. This is seen as a rite of passage steeped in the mind-consciousness of medieval surroundings. It is suggested that the hero's initial meeting with the peasant girl constitutes a sexual involvement. The hero's inner struggle is followed through the vicissitudes of psychic manifestations and is interpreted psychoanalytically.—R. S. Albin.

3091. Nichols, Harold & Smith, Raymond G. (Kansas State U) **Perception of intensional and extensional meaning domains in a semantic differential application.** *Speech Monographs*, 1973(Nov), Vol 40(4), 322-325.—Studied concept-scale and S-scale interaction in the semantic differential. 82 junior speech students rated 5 intensional and 5 extensional concepts on a battery of 15 intensional and 15 extensional semantic differential scales. An extra measurement was added to the usual semantic differential instrument so that Ss could indicate whether they were using each scale in an intensional or an extensional manner. Results support previous findings that Ss have more difficulty rating scale-concept pairs with mixed than with matched meaning domains, and indicate considerable S-scale interaction in the measuring instrument.—*Journal abstract*.

3092. Norris, Margot C. (U Tulsa) **The language of dream in *Finnegans Wake*.** *Literature & Psychology*, 1974, Vol 24(1), 4-11.—Uses Freudian dream theory to support the argument that the complicated language in J. Joyce's *Finnegans Wake* is a deliberate attempt to replicate the intricate processes of translating an unconscious phenomenon to a conscious one. Further support is drawn from linguistic theory, which suggests that conscious language is frequently inadequate for relating some human experiences.

3093. O'Neil, Harold F.; Walker, Mary E. & Judd, Wilson A. (U Texas, Computer-Assisted Instruction Lab, Austin) **Feasibility and utility of an on-line information communication system in a research and developmental management and planning environment.** *US AFHRL Technical Report*, 1974(Jul), No 74-51, 64 p.—Presents an interim report which (a) documents a thorough review of the literature on the implementation and evaluation of on-line data management systems, (b) analyzes methods currently used by the Air Force Human Resources Laboratory (AFHRL) for processing management and planning information, (c) analyzes the information needs of a designated subgroup of AFHRL, and (d) develops implementation and evaluation strategies and demonstrates their feasibility.—*Journal abstract*.

3094. Page, William D. (U Chicago) **Are we beginning to understand oral reading?** *Reading World*, 1974(Mar), Vol 13(3), 161-170.—Describes 2 types of oral reading responses that can be identified by a speaker of English—pseudo-reading, the direct internalization of information into oral responses without determining what the information means, and meaningful oral reading, the transformation of the internal sentence into deep structures. Deep structure includes whatever is required for the semantic interpretation of a sentence. The oral reading error, or miscue, is discussed.—R. S. Albin.

3095. **Parker, Frank.** (Purdue U) **The coarticulation of vowels and stop consonants.** *Journal of Phonetics*, 1974(Jul), Vol 2(3), 211-221.—In a discussion of the properties of English stop consonants, it is noted that the length of the preceding vowel has been posited as the most significant perceptual cue. It is proposed, however, that the perceptual cue correlating with the phonological feature for determining the voice value of stops in postvocalic position is directly linked to the manner of termination of the preceding vowel. (15 ref)

3096. **Pease, Kenneth & Arnold, Paul.** (U Manchester, England) **Approximations to dialogue.** *American Journal of Psychology*, 1973(Dec), Vol 86(4), 769-776.—In an attempt to assess the role of contextual constraints in dialog, a method similar to that of G. Miller and J. A. Selfridge (1950) was used to produce "approximations to dialog." Ss were a total of 69 college students and staff. Ss who had been given a description of the social situation of a conversation and 2-3 utterances as context produced approximations to dialog that were judged by other Ss as more plausible than approximations produced with less context, but not as less plausible than approximations with more context supplied.—*Journal abstract.*

3097. **Pohlman, Alan & Mudd, Samuel.** (Gettysburg Coll, Smoke Psychological Lab) **Market image as a function of consumer group and product type: A quantitative approach.** *Journal of Applied Psychology*, 1973(Apr), Vol 57(2), 167-171.—67 undergraduates and 24 adult men rated approximately 30 brands of each of 3 product types (automobiles, beers, and magazines) for "classiness" on a 9-point graphic scale. Medians and semi-interquartile range values of the rating distributions were calculated for each brand item. These statistics varied systematically as a function of product type and consumer group. Familiarity was correlated significantly with some dimensions of the class-rating distributions.—*Journal abstract.*

3098. **Reed, Michael D.** (U Oregon) **Morris' "Rapunzel" as an Oedipal fantasy.** *American Imago*, 1973(Fal), Vol 30(3), 313-322.—Presents an interpretation of the poem "Rapunzel" by William Morris that views the work as a rite of passage. Themes of love and incest are discussed in relationship to the Victorian times during which the poem was produced.

3099. **Rosnow, Ralph L.** (Temple U) **On rumor.** *Journal of Communication*, 1974(Sum), Vol 24(3), 26-38.—Attempts to define and classify rumor. Rumor is a communication process that is easily started but difficult to stop and constructed around inauthentic information. Several schemes have been used to categorize rumor, including the idea of rumor as pipe dreams (i.e., expressing one's hopes by wishful thinking), logic (i.e., deriving from fears and anxieties), and wedge-driving (i.e., dividing groups and destroying loyalties, with the motivation being aggression and hatred). Rumor-mongering is theorized and conceptualized from sociological, psychoanalytic, and social-psychological views. (84 ref) —*P. Federman.*

3100. **Savitsky, Jeffrey C. & Sim, Marguerite E.** (Purdue U) **Trading emotions: Equity theory of reward and punishment.** *Journal of Communication*, 1974(Sum), Vol 24(3), 140-147.—Examined the nonverbal communi-

cation of a defendant's emotional state (vocal tones, body gestures, and facial expressions). 8 videotapes were used in 2 experiments; each was of a Caucasian male relating to details of a crime while portraying one of the following emotional states: angry, happy, sad and distressed, and neutral. 86 male and 106 female undergraduates rated the severity of a crime on a 7-point bipolar scale of severity. Results indicate that anger elicited more negative evaluations than did the other emotional states; evaluations given to the happy state were more negative than those directed at the sad or emotionally neutral actors. Ss also rated the videotaped person for likeability on a 7-point scale—angry actors were rated least likeable and happy actors were less likeable than neutral actors.—*P. Federman.*

3101. **Sawusch, James R. & Pisoni, David B.** (Indiana U) **On the identification of place and voicing features in synthetic stop consonants.** *Journal of Phonetics*, 1974(Jul), Vol 2(3), 181-194.—Used 2 models of the interaction of phonetic features in speech perception to predict 24 undergraduates' (native speakers of American English) identification functions for a bidimensional series of synthetic consonant-vowel syllables. The stimuli varied systematically in terms of the acoustic cues underlying the features of place of articulation and voicing. Model I assumed the additivity of phonetic features and their independent processing in perception. Model II assumed that the phonetic features interact and are not processed independently. The fit of Model II to the bidimensional series data was better than the fit of Model I, suggesting that the phonetic features of place and voicing in stop consonants are not processed independently but rather show a mutual dependency on each other. (18 ref)—*Journal abstract.*

3102. **Schwartz, Murray M.** (State U New York, Buffalo) **Leontes' jealousy in *The Winter's Tale*.** *American Imago*, 1973(Fal), Vol 30(3), 250-273.—Discusses the motives underlying Leontes' jealousy in Shakespeare's play *The Winter's Tale*. In the play, no external explanation of this jealousy is provided, and it is suggested that this is an attempt to dramatize jealousy whose motivation is embodied in the structure of linguistic and personal relationships acted out on the stage and in our minds. The literature analyzing this play from this viewpoint is discussed. The play itself, the characters, and their motivations are discussed in detail. It is concluded that Leontes' jealousy is not at all motiveless but is the manifestation of processes such as paranoia and suspicion.—*R. S. Albin.*

3103. **Settle, Robert B. & Golden, Linda L.** (California State U) **Attribution theory and advertiser credibility.** *Journal of Marketing Research*, 1974(May), Vol 11(2), 181-185.—Measured consumer confidence in advertising claims and their expectations of product value under 2 conditions. 120 undergraduates completed a 3-part questionnaire on which they rated the importance of product characteristics depicted in 5 advertisements for each of 5 products (ballpoint pen, wrist watch, blender, camera, and clock radio). Some of the ads for each product claimed superiority for the advertised brand on all 5 product features mentioned, and some claimed superiority for only 3 of the 5 (superiority was disclaimed for 2 features thought to be of least importance to the

consumer). As predicted by attribution theory, when superiority was disclaimed for some product characteristics, confidence increased and value expectations equaled that obtained when all were claimed superior.—*L. Gorsey.*

3104. Sigurd, Bengt. (U Stockholm, Inst of Linguistics, Sweden) **Maximum rate and minimal duration of repeated syllables.** *Language & Speech*, 1973(Oct-Dec), Vol 16(4), 373-395.—A simple pilot experiment with strings of open syllables such as /tatata . . . /, /stastasta . . . /, and /strastrastra . . . / was carried out with 4 American, 2 British, 1 German, 1 Swedish, and 1 Korean linguist to determine how fast the syllables could be repeated. Differences in the results were interpreted as being due to individual differences in motor skills and to differences in the phonetic material of the syllables. 2 simple mathematical models were derived to predict the data. One model predicted repetition rate from assumed inherent durational values of the consonants involved. A correction factor was established to compensate for the difference between observed and predicted values. This factor seems to depend on difficulties in coordinating articulatory movements. Some hypotheses and speculations concerning the connection between the results and the phonological structure of languages are advanced. (18 ref)—*Journal abstract.*

3105. Sloane, Eugene H. Coleridge's *Kubla Khan: The living catacombs of the mind.* *American Imago*, 1972(Sum), Vol 29(2), 97-122.—Presents the hypothesis that Coleridge's *Kubla Khan* is an elaborate development of a birth dream. Theories about birth dreams are described with particular reference to the meaning of the poem.

3106. Solomon, Maynard. **Freud's father on the Acropolis.** *American Imago*, 1973(Sum), Vol 30(2), 142-156.—Presents an analysis of Freud's 1936 letter to Romain Rolland, "A disturbance of memory on the Acropolis." The letter is seen as having given access to the entire range of Freud's fantasy life. The oedipal and pre-oedipal ideas are interpreted, along with the feminine-homosexual aspects of the letter. It is suggested that Freud's emotional estrangement on the Acropolis arose from the revival of an early fantasy of pederastic sexual satisfaction by the father. (41 ref)—*R. S. Albin.*

3107. Spiegel, John & Machotka, Pavel. (Brandeis U) **Messages of the body.** New York, NY: Free Press, 1974. xxiv, 440 p. \$17.95.—Presents a scientific study of body language and draws on behavioral science and the visual arts to outline a new theory of nonverbal communication. Experimental data is included to support the theory. (12 p ref)

3108. Steinfatt, Thomas M. & Miller, Gerald R. (Queens Coll, City U New York) **Communication in game theoretic models of conflict.** In G. R. Miller & H. W. Simons (Eds), *Perspectives on communication in social conflict.* Englewood Cliffs, NJ: Prentice-Hall, 1974. xiii, 257 p.—Discusses the concept of conflict and describes the rationale, methodology, terminology, and recent studies of game theory in conflict situations. Strategies of players in game-theoretic conflict situations, the role of communication in game models of conflict, high and low payoffs as real and imaginary rewards, and 2 recent

studies on the effects of communication on game-playing behavior are examined. (4 p ref)

3109. Sternglanz, Sarah H. & Serbin, Lisa A. (U New York, Stony Brook) **Sex role stereotyping in children's television programs.** *Developmental Psychology*, 1974(Sep), Vol 10(5), 710-715.—Conducted an observational analysis of the male and female role models presented on 10 popular commercially produced children's TV programs. Striking sex differences ( $p < .001$ ) were found both in the number of male and female roles portrayed (more than twice as many male roles) and in the behaviors which were emitted by male and female characters. For example, males were more often portrayed as aggressive and constructive (e.g. building and planning) than females, while females were more likely to be shown as deferent. In addition, the consequences that males and females received for emitting behavior were different, with males more often being rewarded and females more often receiving no consequence. An exception to this was that females were more often punished for high levels of activity than were males. Implications of these models for stereotyped sex role development are discussed.—*Journal abstract.*

3110. Studdert-Kennedy, Michael & Hadding, Kerstin. (Haskins Lab, New Haven, CT) **Auditory and linguistic processes in the perception of intonation contours.** *Language & Speech*, 1973(Oct-Dec), Vol 16(4), 293-313.—Systematically varied the fundamental-frequency contour of a 700-msec vocoded utterance, "November," to produce 72 contours, different in fundamental frequency at the stress and over the terminal glide. 22 Swedish and 16 American graduate and undergraduate students classified (a) speech and sine-wave contours as either terminally rising or terminally falling (psychophysical judgments) and (b) speech contours as questions or statements (linguistic judgments). For both groups, 2 factors acted in complementary relation to govern linguistic judgments: perceived terminal glide and fundamental frequency at the stress. Ss tended to classify contours with an apparent terminal rise and/or high stress as questions and contours with an apparent terminal fall and/or low stress as statements. For both speech and sine waves, psychophysical judgments of terminal glide were influenced by earlier sections of the contour, but the effects were reduced for sine-wave contours, and there were several instances in which speech psychophysical judgments followed the linguistic more closely than the sine-wave judgments. It is suggested that these instances may reflect the control exerted by linguistic decision over perceived auditory shape. (35 ref)—*Journal abstract.*

3111. Tholey, Paul. [Zur Einzel- und Gruppenleistung unter eingeschränkten Kommunikationsbedingungen. (Individual and group performance under limited conditions of communication.)] (Germ) Frankfurt-on-Main, W Germany: Waldemar Kramer, 1973. 226 p.

3112. Tomasi, Barbara R. (State U New York, Buffalo) **The fraternal theme in Joyce's *Ulysses*.** *American Imago*, 1973(Sum), Vol 30(2), 177-191.—Delineates the atmosphere of rivalry that permeates *Ulysses*. This atmosphere is seen as the inevitable outcome of the fatherless situation, whether it is the fatherless household or the fatherless society. Freud's interpretation of *Ulysses*

is discussed and criticized. The large number of children in the Irish family could account for a shift of oedipal hostility from the father to the brothers who require so much of the mother's attention.—*R. S. Albin.*

3113. Wind, Yoram & Denny, Joseph. (U Pennsylvania, Wharton School) **Multivariate analysis of variance in research on the effectiveness of TV commercials.** *Journal of Marketing Research*, 1974(May), Vol 11(2), 136-142.—Proposes that multivariate analysis of variance and covariance is a potentially useful approach to marketing experimentation, including on-air TV commercial testing involving a number of response variables. An illustration of the use of these statistical techniques in consumer evaluation of a commercial is presented, and advertising and marketing applications are examined.

3114. Wright, Patricia & Reid, Fraser. (Medical Research Council, Applied Psychology Unit, Cambridge, England) **Written information: Some alternatives to prose for expressing the outcomes of complex contingencies.** *Journal of Applied Psychology*, 1973(Apr), Vol 57(2), 160-166.—68 adults solved problems using information written either as (a) bureaucratic-style prose, (b) a flow chart or algorithm, (c) a list of short sentences, or (d) a 2-dimensional table. Prose was always slower to use and more error-prone than other versions, but error on nonprose formats was affected by problem difficulty. Easier problems resulted in no differential error-rates, although the table was used most rapidly; for harder problems, the algorithm gave fewest errors. Differences in retention strategies appeared when Ss worked from memory—performance with prose and short sentences continued to improve over trials, whereas performance with the algorithm and table deteriorated. It is concluded that the optimal format for written information depends on conditions of use. (15 ref)—*Journal abstract.*

3115. Zeligs, Dorothy F. **Moses and pharaoh: A psychoanalytic study of their encounter.** *American Imago*, 1973(Sum), Vol 30(2), 192-220.—Presents a psychoanalytic interpretation of Moses's contradictory image: that of a man beyond the realm of the mortal yet of human origins and with human failings. A conflict between these 2 forces within the psyche of Moses is exposed. On the one hand, there was the wish for omnipotence while on the other hand, there were deep and painful feelings of inadequacy. This struggle is expressed repeatedly in the Bible. Early indications of conflict, the trauma of failure, the 10 plagues, the flight, and the psychodynamics of these situations are all discussed. (41 ref)—*R. S. Albin.*

3116. Zillman, Dolf & Bryant, Jennings. (Indiana U) **Retaliatory equity as a factor in humor appreciation.** *Journal of Experimental Social Psychology*, 1974(Sep), Vol 10(5), 480-488.—Manipulated squelches (i.e., cleverly stated retorts), depicting a protagonist who is provoked and who then retaliates against his provoker, to effect a variation in the degree of retaliation achieved: extreme underretaliation, underretaliation, fair retaliation, overretaliation, and extreme overretaliation. It was hypothesized that retaliatory equity (i.e., a situation in which the negative consequences inflicted upon the provoker by the retaliator are of a similar magnitude to the negative consequences initially inflicted upon the retaliator) constitutes an optimal condition for mirth, and that both

types of retaliatory inequity, under- and overretaliation, impair humor appreciation in proportion to the magnitude of the resultant inequity. Data from 215 undergraduates who rated the humor of unmanipulated jokes and cartoons and 6 manipulated squelches confirm the hypotheses.—*Journal abstract.*

## PERSONALITY

3117. Allen, Jon G. & Hamsher, J. Herbert. (Northern Illinois U) **The development and validation of a test of emotional styles.** *Journal of Consulting & Clinical Psychology*, 1974(Oct), Vol 42(5), 663-668.—Developed the Test of Emotional Styles based on 3 dimensions of emotionality: responsiveness (intensity of affect), expressiveness (interpersonal communication of affect), and orientation (attitudes toward emotion). 3 measures of these dimensions (incomplete sentences, true-false, and forced choice) were analyzed in a multitrait-multimethod matrix. Construct validity was established by correlations with peer ratings of emotionality, experimentally induced affect, the Marlowe-Crowne Social Desirability scale, the Rotter Incomplete Sentences Blank, and the Mosher Forced-Choice Guilt Inventory. There was substantial support for convergent and discriminant validity, and the measures were unconfounded with adjustment or social desirability. Females scored significantly higher than males on all dimensions in a sample of 120 undergraduates. (23 ref)—*Journal abstract.*

3118. Block, Jack; Block, Jeanne H. & Harrington, David M. (U California, Berkeley) **Some misgivings about the Matching Familiar Figures Test as a measure of reflection-impulsivity.** *Developmental Psychology*, 1974(Sep), Vol 10(5), 611-632.—Argues that a discrepancy exists between J. Kagan's conceptualization of reflection-impulsivity and his operationalization of reflection-impulsivity using the Matching Familiar Figures Test (MFF). A review of the literature reveals little clear evidence for the reflection-impulsivity interpretation of MFF performance. A study with 100 children is reported in which the separate contributions of latency and accuracy were evaluated. Results indicate that accuracy had important personality concomitants; latency was inconsequential. Fast-Inaccurate children were anxious, hypersensitive, vulnerable, and structure-seeking; they were not impulsive, minimally concerned, and unanxious as conjectured by Kagan. Some implications of the study are drawn. (55 ref)—*Journal abstract.*

3119. Cacciaguerra, Francesco. **[Sensibilità e autoscienza nella pubertà. (Sensitivity and self-awareness in puberty.)]** (Ital) Milano, Italia: U Cattolica del Sacro Cuore, 1972. viii, 210 p.

3120. Calhoun, Lawrence G.; Cheney, Thomas & Dawes, A. Stephen. (U North Carolina, Charlotte) **Locus of control, self-reported depression, and perceived causes of depression.** *Journal of Consulting & Clinical Psychology*, 1974(Oct), Vol 42(5), 736.—Administered Rotter's Internal-External Control Scale, the Zung Self-Rating Depression Scale, the Depressive Adjective Checklist, and a questionnaire on the internal vs external causes of depression to 81 undergraduates. Although no significant correlations between the measures of depres-

sion and the checklist of perceived causes were found, data indicate a trend for females to hold themselves more responsible for unhappy moods than males.

3121. Carmer, James C. & Rouzer, David L. (Georgia State U) **Healthy functioning from the Gestalt perspective.** *Counseling Psychologist*, 1974, Vol 4(4), 20-23. —Proposes that mental health does not come from outer security but emanates from inner faith. The personality can be understood only in terms of the whole. Needs must be met in order to maintain evenness and balance. The job of the therapist is to promote awareness so that the client is conscious of his needs. The healthy individual knows himself realistically and is able to identify and reject destructive identifications and alienations. Aggression, in this view, can be beneficial and supportive.—H. Silverman.

3122. Diamond, Michael J. et al. (U Hawaii) **An alternative approach to personality correlates of hypnotizability: Hypnosis-specific mediational attitudes.** *International Journal of Clinical & Experimental Hypnosis*, 1974(Oct), Vol 22(4), 346-353.—In an attempt to overcome the limitations of employing general personality traits to predict hypnotic performance, the present study compared the predictive validity of 2 hypnosis-specific mediational attitudes with a general personality trait (internal-external locus of control). 2 new hypnosis-specific constructs were developed and termed "desirability of hypnosis" and "locus of control in hypnosis." Desirability of hypnosis attitudes significantly predicted hypnotic susceptibility ( $p < .001$ ) of 110 male undergraduate psychology students. There was no relationship between susceptibility and either of the 2 locus-of-control variables. Results are discussed in relation to the social-learning approaches to personality and, in particular, with respect to hypnosis. Attitudes concerning the desirability of hypnosis are considered for modifying hypnotizability. (German, French, & Spanish summaries) (16 ref)—*Journal abstract*.

3123. Ellseo, Thomas S. (Swedish-American Hosp, Rockford, IL) **The hypnotic induction profile and hypnotic susceptibility.** *International Journal of Clinical & Experimental Hypnosis*, 1974(Oct), Vol 22(4), 320-326.—The Hypnotic Induction Profile and the Harvard Group Scale of Hypnotic Susceptibility, Form A were compared using 47 18-22 yr old female nursing students. A significant positive relationship between these 2 scales was found. The eye-roll, which is the ability to roll one's eyes upward and slowly close the lids, was also compared to the Harvard Group Scale of Hypnotic Susceptibility and was not related to it. Results suggest the possibility of using the Hypnotic Induction Profile, which takes only 5-10 min to perform, for rapid screening of experimental Ss and possibly of patients. (German, French, & Spanish summaries)—*Journal abstract*.

3124. Fagan, Joen. (Georgia State U) **Personality theory and psychotherapy.** *Counseling Psychologist*, 1974, Vol 4(4), 4-7.—Discusses theories of personality, on which governments and social systems are based. In psychology, the many branches of personality theory are integrated, but the difficulty of subjecting personality theory to laboratory control puts it outside the realm of scientific measurement. Freud is considered an example of biologically oriented personality theory. Adler's is

socially oriented; O. Rank's is based on self-emphasis. G. Allport represents the eclectics, and H. J. Eysenck the experimentalists. It is not possible to develop an adequate theory of personality, for in order to do so, the theorist would have to transcend his own inner and environmental limitations.—H. Silverman.

3125. Faschingbauer, Thomas R. (Duke U, Medical Ctr, Highland Hosp Div, Asheville) **A 166-item written short form of the group MMPI: The FAM.** *Journal of Consulting & Clinical Psychology*, 1974(Oct), Vol 42(5), 645-655.—Describes the 166-item Faschingbauer Abbreviated Minnesota Multiphasic Personality Inventory (FAM) which was developed using cluster analysis and compared to the MMPI and other short forms. Median reliabilities of .88 for 146 Ss (1 day apart) and .77 for 50 Ss (1 wk apart) as well as median validities of .91 for 399 Ss (in context) and .76 for 119 Ss (1 day apart) were found. All Ss were either normal undergraduates or psychiatric inpatients. On code-type correspondence, configural classifications, profile validities, and scale elevations, the FAM compared favorably to a retest MMPI. Differences in context, obvious, and true items were minimal. The FAM retains the usual 13 scales and 47% of the critical items and showed itself superior to the other short forms in most respects. (37 ref)—*Journal abstract*.

3126. Ghabrial, Talaat M. (Ain Shams U, Cairo, Egypt) **Some characteristics of level of aspiration at university students.** *Psychologia: An International Journal of Psychology in the Orient*, 1974(Mar), Vol 17(1), 16-19.—Examined the concept of "level of aspiration," which has enjoyed a revival as a basic element in cognitive theory. The Zeigarnik effect was studied for the purpose of creating ego-involvement situations. Ss were 100 Egyptian students, of whom 41% showed "adequate" reactions to success or failure, 32% showed an "impulsive" level of aspiration, and 27% showed a "cautious" level of aspiration. (45 ref)—R. D. Nance.

3127. Glass, David C.; Snyder, Melvin L. & Hollis, Jack F. (U Texas, Austin) **Time urgency and the Type A coronary-prone behavior pattern.** *Journal of Applied Social Psychology*, 1974(Apr-Jun), Vol 4(2), 125-140.—Conducted 2 experiments with a total of 71 male undergraduates to examine behavioral consequences of a sense of time urgency, which presumably characterizes individuals classified as manifesting a "Type A" coronary-prone behavior pattern. Exp I indicated that time-urgent Type A Ss were reliably less successful than noncoronary-prone "Type Bs" in performing a task requiring a low rate of response for reinforcement (DRL). Type As were not only unable to delay their responses, but also showed greater evidence of tension and hyperactivity than Type Bs during DRL performance. Exp II extended these results to the interpersonal domain. Time-urgent Ss became more impatient and irritated than less urgent Ss when both types were systematically slowed down in their efforts to reach a solution on a joint decision-making task. Results are discussed in terms of a conceptualization of the A-B dimension as reflecting differential expectations of and needs for environmental control. (24 ref)—*Journal abstract*.

3128. Goldin, George J.; Perry, Sally L.; Margolin, Reuben J. & Stotsky, Bernard A. (Northeastern U) **Dependency and its implications for rehabilitation.** (Rev ed). Lexington, MA: D. C. Heath, 1972. xi, 139 p.—Discusses the sociological and psychological aspects of dependency and its implications for rehabilitation theory and practice. Topics include psychoanalytic, sociocultural, and developmental theories of dependency; behavioral manifestations of dependency (e.g., social, financial, psychomedical, and institutional); dependency in the nonhandicapped; the differentiation concept in field dependence; and rehabilitation of the dependent client. (18 p ref)

3129. Halpin, W. Gerald; Payne, David A. & Ellett, Chad D. (U Montana) **In search of the creative personality among gifted groups.** *Gifted Child Quarterly*, 1974(Spr), Vol 18(1), 31-33.—Administered the What Kind of Person Are You? Test (E. P. Torrance and J. Khatena, 1970) to 360 gifted high school students in 8 academic and artistic areas. Creative personality scores were highest for the social science, art, and science groups, lowest for music and foreign language groups.

3130. Hamburg, David A. (Stanford U, Medical School) **Coping behavior in life-threatening circumstances.** *Psychotherapy & Psychosomatics*, 1974, Vol 23(1-6), 13-25.—Summarizes information on human coping behavior under stress and suggests the potential use of such information in the practice of medicine. Studies are discussed which deal with situations of life-threatening illness and injury (severe burns, severe poliomyelitis, and childhood leukemia). Study of parents of leukemic patients elucidated reactions similar to those observed in studies of burn and polio patients. Coping strategies useful to persons of various ages, both sexes, and different socioeconomic backgrounds in facing a variety of tasks in several stressful situations of life-threatening significance are described. (26 ref)—*Journal abstract*.

3131. Handel, Amos. (U Haifa, Israel) **Cognitive styles among adolescents in Israel.** *International Journal of Psychology*, 1973, Vol 8(4), 255-267.—Administered tests of cognitive skill and personality, and variations of the rod-and-frame series (RFS) and the Hidden Figures Test (HFT) to 557 male students in Grades 7-11. All groups had about the same mean WISC score (approximately 114) and the same variances. Scores on personality scales of neuroticism, extraversion, and internal control were not related to measures of field dependence. Correlation between the RFS and HFT in the total sample indicates that the 2 tests shared only 13% of their variance. While a developmental trend, showing progressive increase in field independence, occurred with advancing age, a parallel trend also applied to personality dimensions reflected in the Q-adjustment score and in the Life scale, tests conceptually independent of the field-dependence construct. 17 of 60 Q-sort items correlated significantly with 1 or both measures of field dependence; field-independent adolescents presented a self-image of self-confidence, self-assertiveness, self-reliance, and self-centeredness, while field-dependent adolescents showed higher needs for succorance and nurturance. Findings call into question the empirical equivalence of the rod-and-frame test and the HFT and

the usual explanation of the source of common variance between these measures and tests of ability. (French summary) (68 ref)—*E. A. Gavin*.

3132. Harris, Darrel E. & Brown, Timothy R. (Resthaven Psychiatric Hosp & Community Mental Health Ctr, Los Angeles, CA) **Relationship of the community adaptation schedule and the personal orientation inventory: Two measures of positive mental health.** *Community Mental Health Journal*, 1974(Spr), Vol 10(1), 111-118.—Studied the relationship between Community Adaptation Schedule (CAS) and the Personal Orientation Inventory (POI), 2 conceptually different measures of positive mental health. Both the CAS and POI were administered to 40 female applicants to a paraprofessional training program for mental health workers. Results suggest a positive relationship between the CAS and POI and support their interdependence as measures of positive mental health. The relationships of the CAS and POI to the Marlowe-Crowne Social Desirability scale are discussed.—*Journal abstract*.

3133. Harvey, John H.; Barnes, Richard D.; Sperry, Dwight L. & Harris, Ben. (Vanderbilt U) **Perceived choice as a function of internal-external locus of control.** *Journal of Personality*, 1974(Sep), Vol 42(3), 437-452.—Selected a total of 50 internal and 50 external undergraduates on the basis of Rotter's Internal-External Control Scale scores. In Exp I Ss chose between options which were either positive or negative in valence. Internals perceived much greater choice when the options were positive in valence than when they were negative, but externals exhibited this tendency to a much lesser degree. Although it was predicted that internals would perceive more choice than externals irrespective of valence, this effect was found only when the options were positive in valence. In Exp II Ss chose between options which were either similar, dissimilar, or identical in attractiveness. As predicted, internals perceived much greater choice when the options were similar in attractiveness, but externals exhibited this tendency to a lesser degree. Results are discussed in terms of (a) a differential sensitivity of internals and externals in their perception of choice as a function of characteristics of the choice options and (b) the possibility of a general tendency for internals to perceive more choice than externals.—*Journal summary*.

3134. Hayashi, Tamotsu; Yamauchi, Hirotsugu & Sudo, Wataru. [The effect of experimental arousal of achievement motivation on imaginative stories.] (Jpn) *Japanese Journal of Educational Psychology*, 1972(Sep), Vol 20(3), 179-183.—After viewing 5 Thematic Apperception Test pictures, 232 elementary school children were asked to write imaginary stories under a neutral situation. 2 mo later Ss were divided into aroused and neutral groups. The aroused group was asked to write stories under an aroused situation; the neutral group wrote them under a neutral situation. The difference between the 2 groups was not significant; however, the direction of change was as expected.—*S. Choe*.

3135. Hedberg, Allan G. (St Vincent's Hosp, Los Angeles, CA) **The effect of certain examiner and subject characteristics on responsiveness to suggestion.** *International Journal of Clinical & Experimental Hypnosis*, 1974(Oct), Vol 22(4), 354-364.—Assessed (a) those

behavioral characteristics which determine an individual's ability to induce suggestion in others and (b) the relationship between susceptibility to suggestions and the traits of neuroticism and extroversion. Ss were 160 female university students classified as neurotic-extrovert, neurotic-introvert, stable-extrovert, or stable-introvert by Eysenck Personality Inventory scores. A role-playing technique was employed to facilitate the study of the effect of E-behavior on suggestivity. Findings demonstrate that susceptibility to suggestion is a function of E-behavior and S's personality traits. Results further support the position that primary and secondary suggestibility may not be unitary factors as generally thought. It is concluded that role playing is a valuable method by which to study the influence of E-behavior. (German, French, & Spanish summaries) (24 ref) —*Journal abstract*.

3136. Heilbrun, Alfred B.; Kleemeier, Carol & Piccola, Gary. (Emory U) **Developmental and situational correlates of achievement behavior in college females.** *Journal of Personality*, 1974(Sep), Vol 42(3), 420-436. —Tested the hypothesis that females with a male sex-gender identification, as defined by perceived similarity to their fathers, will experience motivation problems in direct competition with males. Possible patterns of relationship between sex-gender identification, several role variables, achievement motivation variables, and achievement behavior were explored with 51 female and 35 male undergraduates. Males and females were separately administered a battery of measures—including a rank ordering of 20 self-descriptive adjectives, the Masculinity-Femininity and Achievement scales of the Adjective Check List, verbal-lead stories to be completed by the S, and 2 parallel forms of a digit-symbol task modeled after a WAIS subtest—with different instructions to males and females designed to create competition. From analysis of the data, 2 major conclusions are drawn: (a) a greater number of and more complex relationships emerged for females than for males in examining developmental, social role, and achievement variables; and (b) distinct achievement patterns for the females were found more among those who perceived themselves similar to their fathers than among those who did not. (21 ref)—*B. McLean*.

3137. Hobi, Viktor & Klär, Albrecht. (U Basel, Psychiatric Clinic, Switzerland) **[A combined factor analysis of the MMPI, FPI and 16-PF.]** (Germ) *Zeitschrift für Klinische Psychologie*, 1973, Vol 1(2), 27-48. —Examined the test results of 100 normal juveniles, 50 juvenile and 80 adult toxic psychosis patients who were administered the Saarbrücken MMPI, the Cattell 16 Personality Factors (16 PF), and the Freiburg Personal Inventory (FPI). Factor analysis and varimax rotation of the raw scores on scale level identified 7 factors: (1) clinical-neurotic complaints; (2) extra- vs introversion; (3) openness and assertion vs dissimulation tendencies; (4) emotional integration vs neurotic tensions; (5) moody-suggestible vs suspicious-dogmatic attitude; (6) emotional vs rational behavior control; and (7) dependent vs independent opinion forming. The 16 PF loaded on all factors except 5 but produced few clinical results. The FPI loaded on Factors 1-5 and provided useful clinical differentiation. The MMPI loaded on Factors 1, 2, 3, 5,

and 6 with the main emphasis on clinical factors, but did not attain a separation into symptom-oriented complexes. Results of the study are analyzed in detail and the possibilities of reducing the 3 inventories to the relevant scales are discussed. (English summary) (31 ref)—*T. Fisher*.

3138. Holland, Norman N. (State U New York, Ctr for the Psychological Study of the Arts, Buffalo) **Defence, displacement and the ego's algebra.** *International Journal of Psycho-Analysis*, 1973, Vol 54(2), 247-257. —Describes an algebra that formalizes the terms of clinical experience. Projection, repression, denial, regression, reaction formation, reversal, incorporation, introjection, identification, sublimation, and splitting are all discussed. The algebra is explained with particular reference to the phenomenon of displacement. 4 kinds of displacement are cited: one based on verbal representations, another on likeness and attitudinal differences, another through physical similarity built on perceptions, and another on motility. A topographic model of these categories is presented. (21 ref)—*R. S. Albin*.

3139. Kazdin, Alan E. (Pennsylvania State U) **Reactive self-monitoring: The effects of response desirability, goal setting, and feedback.** *Journal of Consulting & Clinical Psychology*, 1974(Oct), Vol 42(5), 704-716. —Examined the reactive effect of self-monitoring in 3 experiments with a total of 250 undergraduates. In each experiment, performance on a sentence-construction task, the dependent measure, was determined immediately before and after the experimental manipulations were presented. Exp I evaluated the effect of valence or social desirability of the behavior and self-monitoring and being observed by another person; and Exp III replicated the effect of performance standard and also evaluated the role of response feedback. Results indicate that (a) self-monitoring was reactive, (b) the valence given to the target response determined the direction of behavior change, (c) self-monitoring and response valence were necessary but not sufficient conditions for behavior change, (d) monitoring one's own behavior or being monitored by someone else were equally reactive, (e) providing a performance goal or feedback augmented the reactive effects of self-monitoring, and (f) the act of self-recording led to behavior change. (33 ref)—*Journal abstract*.

3140. King, Donald L. & Lummis, Guy. (Howard U) **Effects of visual sensory-restriction and recent experience with the imagined stimulus on a suggestibility measure.** *International Journal of Clinical & Experimental Hypnosis*, 1974(Jul), Vol 22(3), 239-248. —Of 80 female undergraduate Ss, those who were requested to imagine that an extended arm was heavy and falling while exposed to visual sensory-restriction exhibited a greater arm-drop than Ss given the same request and permitted normal vision. Since visual sensory-restriction should increase imagery, this result supports extant correlational research suggesting that vividness of imagery and condition employed to promote imagery, recent exposure to the stimulus to be imagined, did not increase arm-drop. (French summary) (23 ref)—*Journal abstract*.

3141. Ko, Yung-Ho. (National Taiwan U, Taipei, Republic of China) **Birth order and psychological needs.**

*Acta Psychologica Taiwanica*, 1973, Vol 15, 68-80.—Compared the Edwards Personal Preference Schedule scores of 4 groups of 32 university students who were only sons, eldest sons, 2nd-born sons, and youngest sons. Each group was similar on age, family socioeconomic status, father's education, and the degree of urbanization. Results provide partial support for the findings of a previous study by Y. H. Ko and L. H. Lin (see PA, Vol 49:11168). Findings concerning the need for achievement and dominance contradict US findings about the eldest son and support US findings about the only son. (19 ref)—*Journal abstract*.

3142. Kroger, Rolf O. (U Toronto, Ontario, Canada) **Faking in interest measurement: A social-psychological perspective.** *Measurement & Evaluation in Guidance*, 1974(Jul), Vol 7(2), 130-134.—Proposes a social-psychological hypothesis of test faking which postulates that faking involves the enacting of a social role appropriate to the given testing situation. Successful faking depends on favorable motivation, accurate conception of the role involved, adequate role-taking skills, and the presence of role-relevant cues in the test. A series of interrelated experiments, using primarily the Strong Vocational Interest Blank and the Minnesota Multiphasic Personality Inventory (MMPI) as dependent measures, are reviewed. Subtle manipulations of the test-taking environment, designed to induce Ss to adopt given social roles, produced substantial role-specific changes in test scores, or, successful faking. Such faking was not detected by the validity scales of the MMPI. It is concluded that test faking in terms of role enactment represents the test-taker's general approach to testing situations, with success depending especially on the presence of role-relevant cues in the test and on the test-taker's accurate conception of the role to be enacted.—*Journal abstract*.

3143. Kuncze, Joseph T. & Reeder, Charles W. (U Missouri, Columbia) **SVIB scores and accident proneness.** *Measurement & Evaluation in Guidance*, 1974(Jul), Vol 7(2), 118-121.—Reviews 5 interrelated studies, showing that certain preselected Strong Vocational Interest Blank occupational scales were indicative of life-styles related to accident incurrence. The hypothetical formulation underlying these studies was that vocational interest scores reflect enduring personal characteristics, or life-styles, as well as occupational interests. Rates of accident incurrence (using different criteria and different populations) were consistently highest for those having Aviator scale scores substantially higher than Banker scale scores. Findings support a position that accident incurrence may be more a function of life-style than an expression of psychopathology. Findings also support the position that occupational interest scores may be used as indicators of enduring personality characteristics or traits.—*Journal abstract*.

3144. Lessner, Milton & Knapp, Robert R. **Self-actualization and entrepreneurial orientation among small business owners: A validation study of the POI.** *Educational & Psychological Measurement*, 1974(Sum), Vol 34(2), 455-460.—Tested the hypothesis that merchandising-oriented entrepreneurs are more self-actualizing than craft-oriented entrepreneurs. The Personal Orientation Inventory (POI), a measure of self-actualiza-

tion, was administered to samples of small business owners who were identified as merchant- or craft-oriented. Since significant differences were obtained on the major Inner Directed (I) Scale, the hypothesis was supported. Results are interpreted in terms of the significant differences noted between entrepreneurial orientation on 4 out of the 9 POI scales considered.—*Journal abstract*.

3145. Mermin, Dan. (Georgia State U) **Gestalt theory of emotion.** *Counseling Psychologist*, 1974, Vol 4(4), 15-20.—Discusses F. Perls's analysis of emotions, which is based on his personal experience rather than on laboratory studies. To the Gestalt psychologist, emotions are of primary, not tangential importance. The concepts of "body" and "soul" are not different; they represent aspects of the same unity. The body is the reservoir of all cells, the soul the reservoir of all emotions, and the person is the sum of all. Emotions are not bodily changes alone; they are meaningful only in terms of an environment. Technically, emotions cannot be antisocial.—*H. Silverman*.

3146. Midgley, Nina & Abrams, Marsha S. (U Vermont) **Fear of success and locus of control in young women.** *Journal of Consulting & Clinical Psychology*, 1974(Oct), Vol 42(5), 737.—Administered Rotter's Internal-External Control Scale and M. Horner's incomplete story lead designed to evoke achievement anxieties to 108 female undergraduates. The motive to avoid success was significantly positively associated with external control scores.

3147. Moore, Joseph A. & Sermat, Vello. (Memorial U Newfoundland, St John's, Canada) **Relationship between self-actualization and self-reported loneliness.** *Canadian Counsellor*, 1974(Jun), Vol 8(3), 194-196.—125 undergraduates who wished to enter sensitivity groups completed the Personal Orientational Inventory (POI) and also indicated their degree of loneliness. Ss low in loneliness obtained higher scores on the POI, with 8 of the 12 subscales significantly different from Ss high in loneliness. A discussion is presented of the supported general hypothesis that individuals who identify themselves as being more lonely are also likely to be less self-actualized.—*Journal abstract*.

3148. Morgan, Arlene H.; Johnson, David L. & Hilgard, Ernest R. (Stanford U) **The stability of hypnotic susceptibility: A longitudinal study.** *International Journal of Clinical & Experimental Hypnosis*, 1974(Jul), Vol 22(3), 249-257.—Retested 85 former Stanford University students on the Stanford Hypnotic Susceptibility Scale, Form A, after an 8-12 yr retest interval. There was no overall change in level of susceptibility, and the correlation between the total scores on the 2 testings was .60. Hypnotic susceptibility thus appears to be a relatively stable characteristic when measured under standard conditions, and when no intervening special training has been given. (German, French & Spanish summaries) (18 ref)—*Journal abstract*.

3149. Nevill, Dorothy & Damico, Sandra. (U Florida, Office of Academic Affairs) **Development of a role conflict questionnaire for women: Some preliminary findings.** *Journal of Consulting & Clinical Psychology*, 1974(Oct), Vol 42(5), 743.—Describes a 252-item questionnaire which assesses 8 potential role-conflict areas:

Time Management, Relations with Husband, Household Management, Financial, Child Care, Expectations for Self, Expectations of Others, and Guilt. Preliminary data from 242 female respondents suggest that the greatest role conflict for women today involves their self-image and that those areas which deal directly with self-concept are more stressful.

3150. Patterson, C. H. (U Illinois) **Beyond competence: Self-actualization as an integrative concept.** *Counseling Psychologist*, 1974, Vol 4(4), 82-86.—Lists the major aspects of A. Maslow's work. The advantages of his concept of self-actualization are that it is a positive goal, not a negative concept; it avoids the difficulties of the adjustment model; it combines intrapersonal and interpersonal goals; it regards the goal as a process; it allows for individualization; it can be applied to life; it relates to all individuals; and it is a core around which other needs are built and clustered. (21 ref)—H. Silverman.

3151. Peters, Joseph E.; Dhanens, Thomas P.; Lundy, Richard M. & Landy, Frank J. (Lebanon Valley Coll) **A factor analytic investigation of the Harvard Group Scale of Hypnotic Susceptibility, Form A.** *International Journal of Clinical & Experimental Hypnosis*, 1974(Oct), Vol 22(4), 377-387.—Conducted a factor-analytic study of the self-report items of the Harvard Group Scale of Hypnotic Susceptibility, Form A. This scale was administered to an original sample of 368 undergraduates and a replication sample of 246 Ss. 3 rotated factors were found to represent the basic structure of this scale. The 1st 2 factors clearly seem to represent challenge-item performance and responses to passive motor suggestions, while the 3rd factor could be loosely considered to represent cognitive performance. Further analyses showed the factors to be consistent across the 2 samples, to possess adequate reliability, and to be relatively independent. Implications for hypnotic research are discussed. (German, French, & Spanish summaries) (19 ref)—*Journal abstract*.

3152. Ruch, John C.; Morgan, Arlene H. & Hilgard, Ernest R. (Stanford U) **Measuring hypnotic responsiveness: A comparison of the Barber Suggestibility Scale and the Stanford Hypnotic Susceptibility Scale, Form A.** *International Journal of Clinical & Experimental Hypnosis*, 1974(Oct), Vol 22(4), 365-376.—The Barber Suggestibility Scale (BSS) and the Stanford Hypnotic Susceptibility Scale, Form A (SHSS:A) were administered, under both imagination and hypnotic-induction instructions, to 2 samples of 40 paid high school students. The 2 scales were sufficiently correlated to indicate that, in general, they measure responses in the same broad domain. There was, however, a greater discrepancy between objective and subjective scores on the BSS than on the SHSS:A. The subjective scores were not independent of the objective scores but corrected the objective scores for pressure toward social compliance. It is concluded that both scales are satisfactory for preliminary S-selection but limited as criteria for the range of hypnotic responsiveness. (German, French, & Spanish summaries)—*Journal abstract*.

3153. Schwartz, Albert. (Empire State Coll, State U New York, Saratoga Springs) **The Trauma of Birth and Rank's departure from Freud.** *Review of Existential*

*Psychology & Psychiatry*, 1973, Vol 12(1), 75-92.—Examines O. Rank's (1923) theory of the trauma of birth, which purported to answer most of the therapeutic questions confronting psychoanalysts. The basis on which the theory signaled the break between Rank and Freud and Rank's role in the history of psychoanalysis are discussed.

3154. Scott, William A. (James Cook U, Townsville, Qld, Australia) **Varieties of cognitive integration.** *Journal of Personality & Social Psychology*, 1974(Oct), Vol 30(4), 563-578.—Studied 4 styles of cognitive integration (affective balance, affective-evaluative consistency, centralization, and image comparability) within 4 domains of cognition (acquaintances, family, nations, and self) among 554 university students in 3 countries (United States, Japan, and New Zealand). In all 3 countries, the tendency to use one or another integrative style depended both on the cognitive domain and on other structural properties of the Ss' cognitive systems. Affective balance tended to be a preferred style within the domain of family relations and among Ss with simple, highly evaluative, and univalent conceptions of objects. Image comparability tended to be a preferred integrative style within the domains of nations and acquaintances and among Ss with many independent precisely discriminating attributes for appraising objects. (35 ref)—*Journal abstract*.

3155. Sharpe, Deborah T. **The psychology of color and design.** Chicago, IL: Nelson-Hall, 1974. xiii, 170 p. \$9.95.—Investigates the influence of color on personality (and vice versa) and the effects of color on children and on different world cultures. Color theory is analyzed, and a discipline of color and design which can be used in personal living and in business is established.

3156. Spiegel, Herbert. (Columbia U, Coll of Physicians & Surgeons) **The grade 5 syndrome: The highly hypnotizable person.** *International Journal of Clinical & Experimental Hypnosis*, 1974(Oct), Vol 22(4), 303-319.—On a 0-5 hypnotizability range, as measured by the Hypnotic Induction Profile, the Grades 4-5 are identified as highly hypnotizable persons. This group tends to exhibit a clinically identifiable configuration of personality traits: the high eye-roll sign, the high intact Hypnotic Induction Profile score, readiness to trust, a relative suspension of critical judgment, an ease of affiliation with new experiences, a telescoped time sense, an easy acceptance of logical incongruities, an excellent memory, a capacity for intense concentration, an overall tractability, and a rigid core of private beliefs. Role-confusion and a subtle sense of inferiority are often evident. For these persons, treatment strategy requires clarification of central vs peripheral beliefs, increasing sensitivity to positive and negative field-forces, awareness of secondary gain-loss issues, and aid in establishing guidelines to implement with action the integrity of their own beliefs, especially their perception of alternatives and their right to use them. If secondary gain is not formidable under appropriate therapy, these patients have a very good health potential. (German, French, & Spanish summaries)—*Journal abstract*.

3157. Stricker, Lawrence J. (Educational Testing Service, Princeton, NJ) **Response styles and 16 PF higher order factors.** *Educational & Psychological Meas-*

urement, 1974(Sum), Vol 34(2), 295-313.—Explored the relationship of acquiescence, social desirability (SD), and defensiveness response styles with 1st, 2nd, and higher-order factors on the 16 Personality Factors Questionnaire (16 PF). All the various kinds of response bias indexes were appreciably correlated with the 1st-order factor scales. Each kind of response style measure predominantly loaded a different 2nd-order factor, and 4 such factors were extracted, 3 of them corresponding to well-established 16 PF 2nd-order factors. SD scales defined a novel factor somewhat resembling an anxiety factor, and acquiescence and defensiveness measures loaded but did not define independence and anxiety factors, respectively. None of the various kinds of response style indexes consistently loaded an extroversion factor, and none loaded the single 3rd-order factor obtained. This factor was not similar to previously reported 16 PF 3rd-order factors and its nature was unclear. (39 ref)—*Journal abstract*.

3158. Sztulman, H. (U Toulouse-le Mirail, France) **[Narcissism and libido in the light of "On narcissism: An introduction."]** (Fren) *Psychologie Française*, 1972(Jun), Vol 1(1-2), 23-31.—Considers the historical and theoretical significance of Freud's 1914 essay. The evolution of the concept of narcissism up to 1914 is described, and 2 pairs of concepts are analyzed: (a) primary and secondary narcissism and (b) libido of the ego and libido of the object. These distinctions, introduced in the 1914 essay, ran counter to an older pair of opposites, sexual instincts and instincts of the ego. The historical effects of the new perspective consisted of making the recent break with Jung irrevocable and in stimulating a revisionary effort in the whole psychoanalytic camp. On the theoretical level, the road was then open to the radical libidinization of the ego and to creation of the tripartite structure of id, ego, and superego.—*A. Blasi*.

3159. Weiss, Howard & Sherman, John. (New York U) **Internal-external control as a predictor of task effort and satisfaction subsequent to failure.** *Journal of Applied Psychology*, 1973(Apr), Vol 57(2), 132-136.—Used Rotter's Internal-External Control Scale to predict effort expended on a task subsequent to failure on a similar task. Given that a person has an initial need for success and that he expects that working hard will result in success, it was hypothesized that, after failing the task, internals would maintain their initial expectancy and expend more effort on subsequent tasks than externals who would decrease their prefailure expectancies for success. Ss were 41 male undergraduates who completed a series of maze tasks. The Job Descriptive Index was also administered as a measure of task satisfaction. Results confirm this hypothesis, but fail to support secondary predictions regarding task satisfaction. (18 ref)—*Journal abstract*.

3160. Wheeler, Ladd et al. (U Rochester) **Eye-roll and hypnotic susceptibility.** *International Journal of Clinical & Experimental Hypnosis*, 1974(Oct), Vol 22(4), 327-334.—Investigated whether the ability to roll one's eyes upward and then close the eyelids without looking down is a predictor of hypnotic susceptibility. Nonsignificant negative correlations between the eye-roll test and both the Harvard Group Scale of Hypnotic Susceptibility,

Form A, and the Stanford Hypnotic Susceptibility Scale, Form C. Test conditions included separate and blind administration of the eye-roll and susceptibility scales, good reliability and range on all measures, and an adequate sample of 52 psychology students for testing the hypothesized relationship. Population and scale differences, E-bias, and selective elimination of Ss are discussed as possibly producing the relationship between eye-roll and hypnotic susceptibility reported in H. Spiegel's (1970) system. (German, French, & Spanish summaries)—*Journal abstract*.

3161. Willemaers, Rik. **[The human movement in the Rorschach test: A validation study: II. Results.]** (Duth) *Psychologica Belgica*, 1973, Vol 13(3), 313-340.—Presents findings of a study whose purpose and methodology were described previously (see PA, Vol 51:7187). Results indicate (a) a significant positive relationship between human movement and the human content, the Rorschach Index of Repressive Style (RIRS), the pripro TC%, the anxiety score, and the I-aspirations; and (b) a significant negative relationship between human movement and clerical interest. There was no clear relationship between the human movement and R, FM, m, time estimation, time metaphors, Guilford-Zimmerman personality traits, and intelligence. The relationship between human content and other variables was noted to be similar to the relationship between human movement and the same variables, though no significant relationship between human content and RIRS, pripro TC%, and I-aspirations was apparent. (English abstract) (36 ref)—*S. Slak*.

3162. Witkowski, Tadeusz. **[Dimensions of personality and permanent contact with the group.]** (Poln) *Roczniki Filozoficzne: Annales de Philosophie*, 1972, Vol 20(4), 17-31.—Administered the Eysenck Personality Inventory to 2 groups of Ss to compare their scores on the Neuroticism (N) and Extraversion (E) scales. Group 1 consisted of 150 19-27 yr old Ss who had permanent contact with religious-liturgical groups. Group 2 consisted of 100 18-26 yr old Ss whose contact with such groups was not permanent. Permanent-contact Ss were less neurotic and had higher E scores than nonpermanent-contact Ss. Permanent contact with religious-liturgical groups thus appears to be a characteristic of extraverts in spite of the fact that stability and endurance have been correlated with introversion. (17 ref)—*English summary*.

3163. Worthing, Parker M.; Venkatesam, M. & Smith, Steve. (U Massachusetts, Amherst) **Personality and product use revisited: An exploration with the Personality Research Form.** *Journal of Applied Psychology*, 1973(Apr), Vol 57(2), 179-183.—Administered the Affiliation, Aggression, Dominance, Exhibition, and Social Recognition scales of the Personality Research Form (PRF) to 166 male and 66 female undergraduates. A replication study was conducted with 133 male undergraduates. Ss also completed a product use questionnaire which contained 18 product categories. Results (presented for males only since there were too few female nonusers of certain products) demonstrate that product use was related to a complex of personality trait interactions. Canonical analysis revealed 2 significant roots, one which was associated with Affiliation and Aggression and was related to the use of cigarettes, beer,

headache remedies, mouthwash, and men's dress shirts; the other root was associated with all 5 traits and related to the infrequent use of cigarettes, soft drinks, and mouthwash, and to the use of men's cologne, aftershave, and dress shirts. Data also confirm the independence and reproducibility of the PRF scales. (18 ref)—*Journal abstract*.

3164. Yang, Kuo-Shu & Liang, Wang-Huel. (National Taiwan U, Taipei, Republic of China) **Some correlates of achievement motivation among Chinese high-school boys.** (Chin) *Acta Psychologica Taiwanica*, 1973, Vol 15, 59-67.—Studied the relationship of several psychological and sociological variables to achievement motivation, as measured by the Thematic Apperception Test, among 96 Chinese high school boys. The need for achievement was found to be positively correlated with individual modernity and was an inverted-U function of father's socioeconomic status. Firstborns scored significantly higher in need achievement than the youngest, with the mean scores of middle children in between. (32 ref)—*Journal abstract*.

3165. Yang, Pen-Hua L. (National Taiwan U, Taipei, Republic of China) **[Some personality correlates of individual modernity in Chinese college students.]** (Chin) *Acta Psychologica Taiwanica*, 1973, Vol 15, 46-53.—Studied the relationship between 45 personality variables and individual modernity in 374 male and 673 female Chinese college students. Personality variables were assessed by the Chinese versions of the 16 Personality Factor Questionnaire (16 PF), Guilford-Zimmerman Temperament Survey (GZTS), California Personality Inventory (CPI), and Taylor's Manifest Anxiety scale. Modernity was measured by the Individual Traditionality-Modernity Scale, a test specifically constructed for use with Chinese Ss. It was found that individual modernity was positively correlated with CPI scales measuring spontaneity and flexibility and, for females only, with CPI scales reflecting well-being, tolerance, and achievement via conformance. Modernity was negatively correlated with the GZTS scale assessing personal relations for both sexes, and with constraint and friendliness for females. Modernity was positively correlated for females with GZTS ascendance and masculinity scales. Positive correlations were obtained with 5 factors of the 16 PF and modernity was negatively correlated with 2 16 PF scales.—*English summary*.

## PROFESSIONAL PERSONNEL

3166. Argyris, Chris & Schön, Donald A. (Harvard U) **Theory in practice: Increasing professional effectiveness.** San Francisco, CA: Jossey-Bass, 1974. xiv, 224 p. \$10.95.—Discusses the concern that the professions are neither effective nor democratic in practice. Professional competence and its acquisition and the redesigning of professional education according to the necessities of competent practice are explored, and it is proposed that competence is based on the ability to develop theories of what to do in new situations and the ability to behave effectively in the practitioner-client relationship. (3 p ref)

3167. Ash, Leslie C. (Lakehead Psychiatric Hosp, Regional Children's Ctr, Thunder Bay, Ontario, Canada)

**Training in mental retardation for psychiatric residents.** *Canadian Psychiatric Association Journal*, 1974(Feb), Vol 19(1), 55-58.—Surveyed the 16 universities in Canada that offer postgraduate training in psychiatry about their training in mental retardation. Few universities offered courses or even lectures on mental retardation. A majority of universities had no full-time teacher whose field was mental retardation. The prospect of increasing the number of psychiatrists specializing in mental retardation is concluded to be bleak. (French summary) —F. Auld.

3168. Bergman, S. (Tel Aviv U, Israel) **Nursing attitudes to psychiatry and geriatrics as preferred work areas with deviant groups.** *Israel Annals of Psychiatry & Related Disciplines*, 1974(Jun), Vol 12(2), 156-160.—Studied the attitudes of 214 nurses in regard to their preferred clinical area, most preferred patient age group, and the types of expressive and instrumental attributes assigned to the clinical areas. Psychiatry was preferred to geriatrics, and attributes assigned to work in psychiatry were generally professional (instrumental) in nature, while attributes assigned to work in geriatrics were predominantly emotional (expressive). The rejection of the aged as a patient group was strongly pronounced. Possible reasons for the negative attitudes toward the field of geriatrics and the aged are discussed, including the stronger psychiatric component in nursing curricula, the heterogeneity of age groups among psychiatric patients, and the reversibility of some psychiatric conditions.—*Journal abstract*.

3169. Bjerstedt, Ake. Malmö educational reports 1973: Mini-notes from Malmö School of Education. *Didaktometry & Sociometry*, 1974, Vol 6(2), 68 p.—Presents 71 English abstracts or annotations of German-, Swedish-, and English-language reports and reprints issued during 1973 by the Department of Educational and Psychological Research.

3170. Block, William E. (Rockland County Community Mental Health Ctr, Pomona, NY) **The study of attitudes about mental health in the community mental health center.** *Community Mental Health Journal*, 1974(Sum), Vol 10(2), 216-220.—Tested the assumption that a common ideology is shared by the staff of a community mental health center, using Baker and Schulberg's Community Mental Health Ideology Scale. The scores of 3 groups were analyzed: service directors, line staff, and student aides. Marked discrepancies and lack of consensus in beliefs existed among professional disciplines, between service units, and within each category. Implications for inservice training programs and center functioning are discussed.—*Journal abstract*.

3171. Bradley, Fred O. (Kansas State U) **A modified interpersonal process recall technique as a training model.** *Counselor Education & Supervision*, 1974(Sep), Vol 14(1), 34-39.—Studied the use of a modified form of the N. Kagan et al Interpersonal Process Recall (IPR) technique as an influence on the counseling dimensions of level of regard, empathic understanding, unconditionality of regard, and congruence as measured by the Barrett-Lennard Relationship Inventory. Ss were 24 advanced graduate students in a counseling practicum course. The hypothesis was that those groups which underwent the IPR treatment would demonstrate greater

growth on the measured conditions of counseling. Analysis of covariance revealed no significant differences between groups on each of the 4 variables. (15 ref) —*Journal abstract.*

3172. **Brook, Peter.** (Warley Hosp, Brentwood, England) **Psychiatrists: Background, career and career alternatives of a group of recently appointed consultants.** *British Journal of Psychiatry*, 1974(Jul), Vol 125, 1-9.—Reports findings from 1 of a series of mail surveys on the training history and current status of 125 consultant psychiatrists appointed during 1969-1972. Data reveal that (a) differences in background and career existed, depending on the type of hospital in which the consultants had received their psychiatric training; and (b) switching from general psychiatry to one of the psychiatric specialties to achieve consultant status was far less popular an alternative than that of emigrating permanently.

3173. **Brown, Tom.** (U Alberta, Edmonton, Canada) **Present and preferred functions of CGCA members.** *Canadian Counsellor*, 1974(Jun), Vol 8(3), 175-184.—Sent a 53-item counselor role questionnaire (CRQ) to a random sample of 150 Canadian Guidance and Counselling Association (CGCA) members, their administrators, and their clients. Counselors were asked to respond to the CRQ both in terms of what they were doing and in terms of what they judged they should be doing. Returns were received from 49 CGCA members, 24 clients, and 27 administrators representing all provinces and most categories of membership in the Association. The bulk of the respondents were employed in educational institutions and were professionally well prepared. The most frequently reported counselor activities were in the traditionally accepted areas of educational-vocational counseling. Most counselors expressed a desire for a greater level of involvement in group counseling, research, and public relations activities. Counselors were satisfied with their level of involvement on only approximately 25% of the CRQ items. Comparison of counselor, administrator, and client responses indicate conflict or lack of consensus regarding counselor role. Counselors and administrators had the least number of interposition differences, whereas administrators and clients had the most differences. (French summary)—*Journal abstract.*

3174. **Butler, Kevin W.** (Fort Lewis Coll, Miller Student Ctr) **Videotaped self-confrontation.** *Language, Speech & Hearing Services in Schools*, 1974(Jul), Vol 5(3), 162-170.—Describes videotaping as used by the speech pathologist to analyze speech therapy sessions. The Quick Analysis Scoring Form by D. R. Boone and T. E. Prescott was used. The positive and negative reinforcement ratios and the reinforcement efficiency ratios can be analyzed to determine the rate of subsequent reinforcement. The correct response ratio, optimal at 65-80%, is an indicator of the client's performance. If the inappropriate response ratio exceeds 10%, it reveals a problem in the client-clinician relationship. Self-confrontation and self-analysis enable the clinician to improve his therapeutic performance by providing him with an objective view of his own behavior.—*S. S. Liu.*

3175. **Butler, Richard L.** (State U New York Hosp, Upstate Medical Ctr, Syracuse) **Teaching principles of**

**medical ethic curricula.** *Journal of Medical Education*, 1974(Apr), Vol 49(4), 379-380.—Describes the goal, philosophy, and structure of a core curriculum in "medical relevancy" which includes courses on the role of the physician in society and concepts of medical ethics. The curriculum is aimed at developing a professional identity in students and developing their capacity to make correct decisions under changing and often stressful situations.

3176. **Chasis, Herbert & Campbell, Charles I.** (New York U, Medical School) **An experimental clinical science fellowship in cardiovascular-renal diseases.** *Journal of Medical Education*, 1974(Apr), Vol 49(4), 374-378.—Describes an experimental program aimed at evaluating a method of developing physicians who are disciplined by research and competent both as teachers and in the care of patients (clinical scientists). It is considered that contemporary medical education and financing of research tend to drive potential clinical scientists into research inadequately grounded in patient care or into clinical medicine undisciplined by the intellectual challenge of research. It is difficult to obtain support for a recent graduate to further develop his competence at the bedside, teach, and undertake a research project concurrently. 10 preceptors who met the standards of a clinical scientist selected 10 fellows; after 2-4 yrs of training, 3 fellows achieved the goals set for the program and a 4th partially succeeded. 2 failed and 4 resigned before completing the fellowship. It is concluded that the method permits development of physicians competent at the bedside, as teachers, and as investigators.—*Journal abstract.*

3177. **Cleghorn, John M.** (McMaster U, Medical Ctr, Section of Psychiatry, Hamilton, Ontario, Canada) **Organization of psychosocial care in a teaching hospital.** *Psychotherapy & Psychosomatics*, 1974, Vol 23(1-6), 55-65.—Argues that, in order to be globally effective, psychiatrists must take major steps to overcome their marginal position in the medical profession. It is urged that the education of medical students to comprehend and manage psychosocial problems must begin at the outset of their medical educational experience and continue throughout their professional lives. (22 ref)

3178. **Cohen, Earl.** (U California, Medical School, San Francisco) **Suicide and self-assault: An introductory course for medical students.** *Journal of Medical Education*, 1974(Apr), Vol 49(4), 383-385.—Describes a course for 1st- and 2nd-yr medical students which included (a) traditional lectures emphasizing the medical model of disease and its relation to suicidal behavior, (b) interviews with a patient manifesting self-assaultive symptoms, and (c) special seminars on specific social aspects of the problem.

3179. **Davis, Robert M. & O'Connor, James B.** (Pennsylvania State U, Johnstown) **Changes in counseling response preference among rehabilitation counseling interns.** *Counselor Education & Supervision*, 1974(Sep), Vol 14(1), 40-46.—Assessed counseling response preferences of 67 graduate students completing internship requirements using Patterson's Rehabilitation Counseling Response Exercise during the first and final weeks of their internships at a comprehensive, multidisciplinary vocational rehabilitation center. It was hypothesized

ized that at the end of the internship the students would show a significant increase in preference for active counseling responses and a correspondingly significant decrease in preferences for passive techniques. 5 counseling responses (evaluative, interpretive, supportive, probing, and understanding) were evaluated and change did occur as hypothesized.—*Journal abstract*.

3180. Dell Orto, Arthur E. & Jordan, John E. (Sargent Coll, Boston, MA) **A multivariate analysis of racial attitudes: Structure, content, and determinants.** *Rehabilitation Psychology*, 1973(Fal), Vol 20(3), 126-135.—Examined the relationships between attitude behaviors of white and black rehabilitation counselor trainees and selected predictor variables in 47 graduate training programs. Black and white trainees differed markedly on perceived racial differences. Geographic location and sex were predictive of positive racial attitudes, females and those born in the North being more positive. Political and religious preferences were not related to positive racial attitudes. The Guttman facet theory approach to attitude measurement was used, indicating the multidimensional nature of attitude behaviors and supporting Guttman's definition of attitude as "a delimited totality of behavior." In general, attitudes at the action levels were related to an effective-value-contact dimension rather than to a cognitive-knowledge one. (33 ref)—*Journal abstract*.

3181. DiMattia, Dominic J. & Arndt, Gerald M. (U Bridgeport) **A comparison of microcounseling and reflective listening techniques.** *Counselor Education & Supervision*, 1974(Sep), Vol 14(1), 61-64.—Assigned 15 graduate students in counseling to either microcounseling or reflective listening training groups. Microcounseling procedures included videotaping attending behaviors between various group members and discussing the videotapes; reflective listening procedures involved videotaping structured person-to-person responses and evaluating facilitative and expressive responses. Counseling skills were rated by 4 trained judges in terms of eye contact, verbal following, posture, and overall effectiveness. There were no significant differences between the groups for any criteria; however, significant differences on 3 of the 4 criteria from pre- to posttest evaluations were observed in both groups. It is suggested that the failure to effect any significant change in trainees' posture may be due to Ss' high level of functioning on this variable before training.—*L. Gorsev*.

3182. Dubey, Joseph. (North Shore Hosp, Manhasset, NY) **Confidentiality as a requirement of the therapist: Technical necessities for absolute privilege in psychotherapy.** *American Journal of Psychiatry*, 1974(Oct), Vol 131(10), 1093-1096.—Considers that privilege for the psychotherapist is a technical necessity for certain forms of psychotherapy. Psychiatrists are not legally protected from being compelled, in certain situations, to divulge information; therefore, their patients are in danger of either being embarrassed or of having their therapy subverted for secondary gain. There is an inherent conflict between the goals of the therapist and of the advocate and an incompatibility between the functions of treatment and evaluation. It is suggested that the communications and information of psychotherapy be excluded from public policy and that the therapist

should not perform evaluative functions during litigation; if psychiatric information is necessary, it should be obtained from an independent court-appointed psychiatrist. (18 ref)—*Journal abstract*.

3183. Dubin, Samuel S. (Pennsylvania State U) **The psychology of lifelong learning: New developments in the professions.** *International Review of Applied Psychology*, 1974(Apr), Vol 23(1), 17-31.—Studied the significance of professional obsolescence, its causes, symptoms, and definitions. The concept of "half-life"—the point after completion of training when a professional has become roughly half as competent as he was upon graduation—was used to measure the obsolescence of a profession. Major areas needing study are (a) motivation for professional updating; (b) adult learning; (c) measuring professional competence; (d) surveys of self-perceived educational needs; (e) educational technology; (f) counseling adults and midcareer change; (g) periodic readmission of professional persons to postgraduate training; and (h) research and evaluation. Data concerning updating within professions is provided for medicine, the science and management of natural resources, education, psychology, law, dentistry, management, and engineering. (60 ref)—*L. A. Ostlund*.

3184. Elgie, Nancy A. **Public relations in a private practice.** *Ontario Psychologist*, 1974(Aug), Vol 6(3), 49-52.—Discusses how a psychologist in private practice is affected by public relations in initiating his practice and in dealing with referral sources, patients, the community, and other professionals.

3185. Felton, Gary S.; Wallach, Howard F. & Gallo, Charla L. (Children's Hosp of Los Angeles, Allied Health, CA) **New roles for new-professional mental health workers: Training the patient advocate, the integrator, and the therapist.** *Community Mental Health Journal*, 1974(Spr), Vol 10(1), 52-65.—Describes the conceptualization, development, and implementation of a Veterans Administration neuropsychiatric hospital-based human services worker (new-professional) training program. The program involves an experientially heterogeneous group of 16 trainees whose practical and academic training will be centered around the veteran psychiatric patient and the community with which he is in contact. 4 principal roles of this new professional are emphasized: (a) patient advocate, (b) longitudinal contact person for patients from hospital admission to posthospitalization community adjustment, (c) integrator of the patient's ongoing treatment process and experiences, and (d) cross-disciplinary worker who under supervision relieves existing professionals of the less specialized portions of their workload. (18 ref)—*Journal abstract*.

3186. Flax, Jim & Garrard, Judith. (U Minnesota, Medical School) **Students teaching students: A model for medical education.** *Journal of Medical Education*, 1974(Apr), Vol 49(4), 380-383.—Describes the development of a pilot course in interviewing and taking a medical history designed for 1st-yr students and taught by 5 2nd-yr students. Results of the pilot course were compared with those of a standard course; findings indicate the value of peer teaching.

3187. Foster, Sue; McClanahan, L. D. & Overley, Teresa. (Athens Mental Health Ctr, OH) **Mental hospital**

staff attitudes as a function of experience, discipline, and hospital atmosphere. *Journal of Abnormal Psychology*, 1974(Oct), Vol 83(5), 569-577.—Asked 234 mental hospital employees in 5 disciplines to complete a staff attitude scale. 6 attitude factor scores were compared using a Discipline  $\times$  Experience multivariate analysis of variance with education as covariate. Attitudes toward patient care were significantly different among 4 disciplines and across 6 different experience levels. A separate analysis yielded no sex differences. Using previously published means from 6 hospitals, plus data from the present sample, a multivariate Hospital  $\times$  Discipline analysis was completed on 2,178 Ss. The 6 traditional hospitals differed significantly from a transitional hospital. Because of possible violations of assumptions, the last analysis requires further support. (30 ref)—*Journal abstract*.

3188. Friedrichs, Robert W. (Williams Coll) **The impact of social factors upon scientific judgment: The "Jensen thesis" as appraised by members of the American Psychological Association.** *Journal of Negro Education*, 1973(Fal), Vol 42(4), 429-438.—Sent a 1-item Likert questionnaire to 526 representative members of the American Psychological Association (APA), 225 additional APA residents of Alabama and Mississippi, and 242 additional members who are "ethnically Jewish" (as determined by name). The questionnaire concerned their attitude toward Jensen's thesis of a genetic, as opposed to environmental, basis for Negro-Caucasian intelligence difference. 60% of the total sample disagreed with Jensen's genetic thesis and 28% agreed. The Jewish sample was significantly less in agreement with Jensen (22% agreed, 60% disagreed) than the representative sample less the Jews ( $p < .03$ ). The Alabama-Mississippi sample was more in agreement with Jensen (31% agreed, 49% disagreed) than the total sample less Alabama-Mississippi residents ( $p < .05$ ). Physiological and comparative psychologists were significantly more in agreement with Jensen (36% agreed, 51% disagreed) than other psychologists ( $p < .05$ ).—*W. E. Sedlacek*.

3189. Friesen, John W. (U Calgary, Alberta, Canada) **Evaluating supervised pastoral education: A pilot study.** *Journal of Pastoral Care*, 1973(Dec), Vol 27(4), 229-235.—Conducted a pilot study to evaluate supervised pastoral education with 11 students, representing a variety of denominations, involved over 2 summers at a general hospital in Canada. The program emphasized academic presentations, ward visitation and practical experience, and interpersonal relations sessions. Evaluation instruments included The Adjective Check List, The Daily Reaction Report, Supervisor's Assessment, and Individual Student Assessment. The Daily Reaction Report was a page written each day by the student to express his feelings about the daily experiences. These reactions were rated positive or negative on a 5-point scale by 2 readers. During 1 summer session, a semantic differential technique was also used with a control group of 10 clergymen. These measures were used for individual candidate assessment as well as for the program evaluation.—*B. Smith*.

3190. Fujinaka, Larry H. & Stone, Shelley C. (DePauw U) **Counselor commitment and career development.** *Counselor Education & Supervision*, 1974(Sep),

Vol 14(1), 47-53.—Examined the relationship between preparation and career commitment by studying the degree to which counseling personnel actively involve themselves as school counselors after training. If counselor education programs are truly concerned with preparing professionals for a career, then long-term involvement is an important criterion reflecting the success of counselors and their prior preparation. Results from a study tracing 406 graduates from 20 National Defense Education Act (NDEA) institutes 6 yrs after training show that only 45% immediately entered and remained in counseling for 6 yrs. The existence of a teacher-counselor-administrator promotion ladder is presented as being a major source of loss from the ranks of school counseling. A related finding showed non-entry to counseling to be caused by a return to classroom teaching after counseling preparation.—*Journal abstract*.

3191. Gabridge, Michael G. (U Illinois, School of Life Sciences) **Medical microbiology: Deficits and remedies.** *Journal of Medical Education*, 1974(Apr), Vol 49(4), 389-391.—Recent surveys of medical school graduates indicate a serious deficit in their retention of microbiological principles. A medical school curriculum is described which emphasizes core disciplines and which utilizes a behavioral objective teaching format and independent self-study. Preliminary results indicate that students in this program performed better on final examinations than students in a traditional program.

3192. Gamble, Thomas E. (U Illinois, Medical School, School of Basic Medical Sciences) **The practicing physician's involvement in the training of medical students.** *Journal of Medical Education*, 1974(Apr), Vol 49(4), 331-337.—Surveyed 20 practicing physicians (mean age = 44.95 yrs) who also acted as nonsalaried clinical faculty at a university to determine their attitudes concerning (a) continuing education benefits to the physician through his involvement in teaching medical students; (b) whether the practicing physician has sufficient time to be involved in a teaching program; (c) pedagogical implications of a semi-independent study medical curriculum; (d) the impact of teaching involvement on the practicing physician's work; and (e) the role, status, and professional responsibilities of teaching. Results indicate that the physicians supported the program in all 5 areas surveyed.—*Journal abstract*.

3193. Gartrell, Nanette; Kraemer, Helena & Brodie, H. Keith. (Stanford U, Medical School) **Psychiatrists' attitudes toward female homosexuality.** *Journal of Nervous & Mental Disease*, 1974(Aug), Vol 159(2), 141-144.—Reports answers to a questionnaire distributed to 908 psychiatrists, 42% of whom responded. Almost all (98%) favored legalization of homosexual behavior between consenting adults; 66% opposed the use of psychiatric labels in categorizing female homosexual behavior. 87% stated that their concept of mental health included the possibility of a well-adjusted homosexual woman, and 66% challenged the traditional belief that Lesbianism represents sickness or inadequacy. (15 ref)—*Journal abstract*.

3194. Gimmetad, Michael J. & Greenwood, Janet D. (Florida State U) **A new twist on IPR: Concurrent recall by supervisory group.** *Counselor Education & Supervision*, 1974(Sep), Vol 14(1), 71-73.—Discusses theoretical and

empirical evidence for the use of the N. Kagan et al Interpersonal Process Recall (IPR) technique in group settings. This modification would include a small group of peers and 1 or 2 supervisors all serving as recallers simultaneously, instead of only 1 recaller. Preliminary data from the use of group IPR with 12 counseling students are presented which suggest that group IPR provides initial interviewing training appropriate for supervision of practicum and internship work and for ongoing supervision and inservice training of skilled practitioners.—*L. Gorsey.*

3195. Gregory, Robert J. (Duke U, Medical Ctr) **A community education drug abuse project.** *Drug Forum*, 1974(Spr), Vol 3(3), 259-266.—Describes a comprehensive small group educational and training experience focused on the issues and problems of drug abuse. 25 responsible adults were trained to lead small group sessions. Pre- and posttesting were done to test the knowledge, attitudes, and feelings of the participants about the drug scene, human relationships, and the course.

3196. Gutheil, Thomas G. (Massachusetts Mental Health Ctr, Boston) **Rapid retrieval of literature for the practicing psychiatrist: A practical approach.** *American Journal of Psychiatry*, 1974(Oct), Vol 131(10), 1145-1147.—Describes a method of information storage and retrieval for psychiatric literature, based on dividing journals into component articles and filing by subject matter. It is suggested that use of this system will result in significant savings of time and effort. A list of suggested subject categories to facilitate initiation of the system is included.

3197. Halmos, Paul. (University Coll, Cardiff, Wales) **The personal and the political.** *British Journal of Guidance & Counseling*, 1974(Jul), Vol 2(2), 130-148.—Notes that the term "counseling" is used liberally to convey pedagogical, casework, and clinical meanings. The indiscriminate use of the term by institutions of health, welfare, and education often conceals the intention to appear more solicitous to clients than the institution can afford to be. The central factor in counseling is the use of the counselor's total and global personality in effecting changes in the personality of the client. This factor is shown to be potentially present even in behavior therapy where it would be explicitly disclaimed. Counseling, therefore, is a personalistic process. Political accusers charge counselors, social caseworkers, psychotherapists, and others with a desertion of their moral duty to change evil systems and with distracting attention from the really important public miseries inflicted on man by these systems. The present article stresses the incompatibilities of the personal and political roles and advocates a continued protection of the integrity of these meliorist roles. (30 ref)—*Journal abstract.*

3198. Hiemstra, Roger & Long, Roger. (U Nebraska, Lincoln) **A survey of "felt" versus "real" needs of physical therapists.** *Adult Education*, 1974, Vol 24(4), 270-279.—Stresses that constantly emerging knowledge has made continual learning a necessity for health-related professionals. A questionnaire was administered to 77 physical therapists to compare their felt needs (personal perceptions symptomatic of problems) with

their real needs (actual knowledge or skill weaknesses). A literature review prompted the null hypothesis of no correlation between perceived felt needs and demonstrated real needs. Statistical testing (Pearson correlation) suggested a failure to reject the null hypothesis (.05 level). The differences between felt and real needs indicate the complexity of the needs assessment process and the limited usefulness, in planning continuing education programs, of a questionnaire that solicits only personal perceptions of need.—*Journal abstract.*

3199. Housley, Warren F. & Magnus, Robert E. (Mississippi State U) **Increasing empathy for employment service counselors: A practicum.** *Journal of Employment Counseling*, 1974(Mar), Vol 11(1), 28-31.—Outservice practicum training of employment service counselors presents a particular challenge to counselor educators. An overview of a 2-wk practicum-laboratory training program with a total of 30 employment counselors is presented and discussed. The efficacy of the training is examined from the standpoint of helpful levels of empathy presented by the counselors trained. The difference between pre- and posttraining levels of empathy indicates that statistically significant gains were realized.—*Journal abstract.*

3200. Hurst, Michael W. & Shatkin, Stephen D. (Boston U, Medical School) **Relationship between standardized admissions variables and certain interpersonal skills.** *Counselor Education & Supervision*, 1974(Sep), Vol 14(1), 22-33.—Investigated the predictive value of data readily available on college admission forms. An admissions model was developed that includes standardized intellectual and nonintellectual variables. The admissions "scores" of 3 groups of 33 counseling students (age range, 22-35 yrs) were tested against levels of performance on a tape-test of 3 counseling skills. Linear combinations of grade point average, quality of undergraduate college, major area of study, and recommendations and work experience were generally unrelated to pre- or posttraining ratings of empathy, respect, and genuineness. New variables based on Carkhuff's Counseling Simulation Inventory were added to the admissions equation and significantly raised the predictive power of the admissions score. (50 ref)—*Journal abstract.*

3201. Jarzebowska-Baziak, Barbara & Morawski, Jacek. (Ctr for Research in Criminality, Warsaw, Poland) **[Professional opinions concerning resocialization of recidivists.]** (Polh) *Przegląd Penitencjarny i Kryminologiczny*, 1972, Vol 10(1), 40-55.—Discusses questionnaire responses by 49 county and other judges and 464 staff members of penal institutions for recidivists, both heads of departments and rank and file personnel. Most respondents believed that hard physical labor and discipline are more valuable than education in handling recidivists. Vocational training should be concerned with the needs of the economy, rather than with the individual's ability. Several differences between the views of the judges and those of penal personnel are mentioned. (French summary)—*A. Z. Arthur.*

3202. Jones, Lawrence K. (North Carolina State U, Raleigh) **Toward more adequate selection criteria: Correlates of empathy, genuineness, and respect.** *Counselor Education & Supervision*, 1974(Sep), Vol 14(1),

13-21.—Reports correlations obtained between scores or ratings on 17 variables derived from a review of the literature on the problem of selection and rated levels of empathic understanding, genuineness, and respect provided by 19 graduate students to clients during the counseling practicum experience. Ss completed a battery of psychological tests including 3 scales of the MMPI, 8 scales of the Edwards Personal Preference Schedule, and the Complexity scale of the Omnibus Personality Inventory. Empathic understanding and respect were significantly related to 2 similar personality variables: tolerance of ambiguity and need for order. Ratings from Carkhuff's index of communication were significantly related to empathic understanding. None of the variables was significantly related to genuineness. Suggestions are made for further research and the improvement of existing selection instruments. (27 ref)—*Journal abstract.*

3203. Krell, Robert; Miles, James E. & Maurice, William L. (U British Columbia, Div of Child Psychiatry, Vancouver, Canada) **Training in child psychiatry: A model for medical undergraduates.** *Journal of Medical Education*, 1974(Apr), Vol 49(4), 368-373.—Describes the child psychiatry component of a teaching program in general psychiatry for 4th-yr medical students. The students staff a psychiatric ward for 8 wks, and 1 day/wk is spent in a structured program of child and family psychiatry. The total experience can be viewed as consisting of 2 parts: the 1st 4 days are devoted to interviews and basic diagnostic and descriptive skills, while the 2nd 4 days consist of a series of didactic seminars. The common thread is the continued patient and family evaluation by the student for the full 8 days. All teaching of basic skills and academic content is related to, or stimulated by, the patients who are being evaluated. 6 students supervised by 2 instructors are scheduled for each 8-wk rotation. This model can be used for other professionals seeking experience in psychiatry.—*Journal abstract.*

3204. Lambert, Michael J. (Brigham Young U) **Supervisory and counseling process: A comparative study.** *Counselor Education & Supervision*, 1974(Sep), Vol 14(1), 54-60.—Compared the process of supervision with that of counseling by examining the behavior of 5 professional therapists in both situations. Counselors recorded their counseling sessions with 10 clients and their supervisory sessions with 10 trainees. The level of facilitative conditions (empathy, respect, genuineness, and specificity) was assessed in 180 3-min tape excerpts. The Hill Interaction Matrix was also used to compare the verbal interactions in both counseling and supervising situations. Results indicate that the level of respect and genuineness were equal in the 2 situations. Contrary to previous assumptions, the levels of empathy and specificity were significantly lower in supervision than in counseling. When interactions were rated with the matrix, supervision was significantly less therapeutic than was counseling. Implications for the teaching and learning of psychotherapy are discussed.—*Journal abstract.*

3205. Lapointe, Roger E. (U Montreal, Quebec, Canada) **The use of psychological tests by Ontario psychologists.** *Ontario Psychologist*, 1974(Jun), Vol 6(2), 75-82.—Reports answers by 260 Ontario psychologists

to a questionnaire asking which 5 tests or test batteries they used most frequently. Those names most often were the WISC, WAIS, Bender-Gestalt, Rorschach, Thematic Apperception Test, and the MMPI. 16% used no tests at all.

3206. Law, Bill. (U Reading, School of Education, England) **Anne's story: A counsellor's dilemmas.** *British Journal of Guidance & Counseling*, 1974(Jul), Vol 2(2), 212-220.—A school counselor describes a series of interviews with a high school girl to illustrate dilemmas faced by the counselor in synthesizing role expectations of himself, the client, and society. It is suggested that, before seeing the client, the counselor should determine how much client exploitation and conflict with society he can tolerate.

3207. MacKenzie, Fredericka; Davis, Howard V. & George, Rickey L. (Southern Illinois U, Edwardsville) **A question of accountability: Student representation.** *Counselor Education & Supervision*, 1974(Sep), Vol 14(1), 75-77.—Discusses the issues involved in student representation in academic decision-making processes. The role and function of the student representative within a counselor education department, relevant faculty concerns, and implications for student-teacher and general academic relationships are discussed.

3208. Malouf, Roberta E. & Alexander, James F. (Granite Community Mental Health Ctr, Salt Lake City, UT) **Family crisis intervention: A model and technique of training.** In R. E. Hardy & J. G. Cull (Eds), *Therapeutic needs of the family: Problems, descriptions and therapeutic approaches*. Springfield, IL: Charles C Thomas, 1974. xv, 240 p.—Describes a family-centered approach to short-term crisis intervention counseling, which emphasizes the role of interpersonal processes and characteristics of family system membership in the genesis of conflict. Treatment stresses the joint involvement of all family members in formulating behavior goals and strategies, and therapist training incorporates many of the same experiences that families receive—modeling, reinforcement, and role playing.

3209. Mandell, Arnold J. (U California, Medical School, San Diego) **The changing face of chairmen of psychiatry departments in America: An opinion.** *American Journal of Psychiatry*, 1974(Oct), Vol 131(10), 1137-1139.—Suggests that 2 decades ago psychiatrists were trained by a few charismatic, humanistic clinicians who did not have much to do with laboratories or fund raising. After World War II academic psychiatry was transformed, largely by federal money, into a multidimensional scientific enterprise, the leaders of which needed to be scientific entrepreneurs as well as persuasive humanists. But since the fantastic promise of a technology for universal well-being could not be fulfilled before the sources of financial support began to dry up, department chairmen are evolving from humanistic scientists into corporate executives who haven't the time or energy to pursue clinical elegance or rigorous laboratory research firsthand.—*Journal abstract.*

3210. Martin, Roger D. & Shepel, Lawrence F. (U Saskatchewan, Saskatoon, Canada) **Locus of control and discrimination ability with lay counselors.** *Journal of Consulting & Clinical Psychology*, 1974(Oct), Vol 42(5), 741.—Hypothesized that structured training would

increase the ability to discriminate helpful counseling conditions and cause a shift toward the internal dimension of locus of control with an associated increase in trust, insight, and self-confidence. Data from 21 senior female nursing staff support the hypothesis and suggest that locus of control measures may be useful as selection devices to optimize training effectiveness with lay counselors.

3211. **McConnell, Lawrence G.** (McGill U, Montreal, Quebec, Canada) **The counsellor and his asexual client.** *Canadian Counsellor*, 1974(Jun), Vol 8(3), 207-210. —Contends that in terms of human sexuality, counselors are trained to function as if living in a Victorian society. This is achieved by simply pretending that sex does not exist. It is considered that the counselor has a role to perform in assisting his clients to come to grips with their own sexuality. The counselor's competence in this area is questioned, and his training in the area of human sexuality is urged. (French summary)—*Journal abstract*.

3212. **McCreary, Bruce D.** (Kingston Psychiatric Hosp, Mental Retardation Services, Ontario, Canada) **Full-time medical practitioners in Canadian mental retardation facilities.** *Canadian Psychiatric Association Journal*, 1974(Feb), Vol 19(1), 51-53.—Surveyed full-time physicians working in mental retardation institutions in Canada. Data from 78 physicians, perhaps half of all those employed, show that 50% were primary-care physicians and 30% were psychiatrists. Few of the respondents had had training in child psychiatry, genetics, or mental retardation. It is concluded that physicians who work in institutions for retardates should be specifically trained for this work.

3213. **McNally, Harry A. & Drummond, Robert.** (Maine School Administrative District 24, Van Buren) **Ratings of Carkhuff's facilitative conditions: A second look.** *Counselor Education & Supervision*, 1974(Sep), Vol 14(1), 73-75.—Examined the factor structure of ratings made with R. R. Carkhuff's 1969 revision of scales for assessing facilitative counseling conditions (empathic understanding, facilitative genuineness, and communication of respect). Results indicate the existence of 2 (Empathy-Genuineness and Respect) rather than 3 main factors, and suggest the need for evaluating counselor helpfulness on these more general dimensions rather than by 3 discrete variables.

3214. **Meadows, Chris M.; Kemp, Charles F.; Hiltner, Seward & Hopewell, James F.** (Vanderbilt U, Divinity School) **A symposium on research for the professional doctorate.** *Journal of Pastoral Care*, 1973(Dec), Vol 27(4), 267-282.—Reports how 4 individuals involved in professional doctorate programs in ministry responded to the following questions concerning appropriate professional research: How do you understand the nature and purpose of research for the professional doctorate? How is this research same or different from research for the PhD or ThD degree? How specialized or focused in a particular area of ministry or academic discipline is it appropriate for professional doctoral projects to be? Is there any experience you can share concerning professional doctoral projects in the area of pastoral care and counseling?

3215. **Muslin, Hyman L.** (U Illinois, Abraham Lincoln School of Medicine) **Clinical exercises in empathy.**

*Diseases of the Nervous System*, 1974(Aug), Vol 35(8), 384-387.—Presents a demonstration of the psychological work necessary for using empathy as an observational mode. The method requires that individuals be able to make a distinction between subjective reactions to others and empathy.

3216. **Muslin, Hyman L.; Thurnblad, Robert J.; Templeton, Bryce & McGuire, Christine H.** (Eds.). (U Illinois, Abraham Lincoln School of Medicine) **Evaluative methods in psychiatric education.** Washington, DC: American Psychiatric Association, 1974. xiii, 220 p. —Presents a monograph containing 14 papers on the history, current status, and future of various methods of assessment and evaluation in psychiatric education. Topics include applications of patient-management problem tests to psychiatry; the use of multiple-choice testing, videotape and film, computer simulations of clinical encounters, and problem-oriented records in psychiatric training; and the theory and methods of evaluating the quality of care.

3217. **Nadolsky, Julian M.** (Auburn U) **Guidelines for the classification and utilization of vocational evaluation personnel.** *Rehabilitation Literature*, 1974(Jun), Vol 35(6), 162-173.—Presents guidelines for recruiting and utilizing vocational evaluation personnel by public and private rehabilitation agencies, in the form of job descriptions and a classification scheme using a 7-tiered hierarchy ranging from aide to fully competent professional practitioner. Specific staffing patterns for small, medium, and large vocational evaluation programs are suggested.

3218. **Nelson-Jones, Richard & Patterson, C. H.** (U Aston, Birmingham, England) **Some effects of counselor training.** *British Journal of Guidance & Counseling*, 1974(Jul), Vol 2(2), 191-199.—The 1st 2 classes of a British university graduate counseling program, consisting of 5 students in 1971-1972 and 11 students in 1972-1973, were measured on their ability to respond empathically and to discriminate the quality of other counselors' responses at the beginning and the end of the academic year. Additionally, the 1972-1973 group was administered a counselor attitude scale. Significant differences were found between pre- and posttest means on all 3 measures for the 1972-1973 group and on the communication of empathy for the 1971-1972 group. Findings for the 2 groups are discussed in relation to each other and to comparable American data. (18 ref)—*Journal abstract*.

3219. **Nelson-Jones, Richard.** (U Aston, Birmingham, England) **Some thoughts in counsellor training.** *British Journal of Guidance & Counseling*, 1974(Jul), Vol 2(2), 182-190.—Suggests that the main object of counselor training—helping trainees offer an effective counseling relationship—requires 3 main training elements: personal, practical, and academic. Ways in which the personal development of trainees may be fostered include individual support counseling and a weekly encounter group session. While constructive feedback is necessary, a minimum of evaluation is suggested so that the trainee can feel safe and free to explore himself. Preplacement training focused on empathic understanding is considered essential before the trainee is allowed to begin supervised placement, and a program of practical work

training is outlined. Reasons for including academic work are also discussed, and appropriate academic content is suggested. The problem of obtaining suitably qualified trainers is considered, along with the desirability of trainers continuing to counsel and the need for adequate administrative support for training programs. (15 ref)—*Journal abstract*.

3220. Nisbet, John & Mackay, Ken. (U Aberdeen, Scotland) **The training of educational psychologists in Scotland.** *Association of Educational Psychologists Journal & News Letter*, 1971(Fal), Vol 2(10), 17-20.—Compares the training of educational psychologists in Scotland and in England. Scottish educational psychologists are required to have an honors degree in psychology or its equivalent, a recognized teaching qualification, and postgraduate professional training, either through a formal course or through on-the-job apprenticeship. Among the strengths of the Scottish program are its strong educational flavor, especially in the training, which includes the Master's degree in Education, and the fact that it allows mature, experienced people the opportunity to enter the profession. Students have more time to consider their careers than they do in the English system. The Scottish tendency to see psychological services as an extension of the teaching profession can be both a strength and a weakness. The latter refers to the lower initial salaries, a problem which is overcome at the senior level.—*I. L. Zimmerman*.

3221. Nishizono, Masahisa. (Kyushu U, Faculty of Medicine, Fukuoka, Japan) **[New psychiatry and nursing: VIII. History of psychiatric treatment focused on schizophrenics.]** (Japn) *Kyushu Neuro-psychiatry*, 1971(Oct), Vol 17(2), 98-104.—Suggests that for effective treatment psychiatrists and nurses must understand not only the use of drugs but also the importance of humanitarian treatment of patients. The patients must understand the importance of establishing better interpersonal relationships.

3222. Padilla, Elena & Goldston, Stephen E. (New York U, Graduate School of Public Administration) **Role of schools of public health in the development of mental health manpower.** *Community Mental Health Journal*, 1974(Spr), Vol 10(1), 16-23.—Presents research findings on the perceptions of graduates of accredited schools of public health concerning the mental health training they received and the place of mental health in public health work. Questionnaires were mailed in 1968 to 4,459 American citizens who received MA degrees during 1961-1967. Data obtained from the 2,605 respondents reveal the extent of exposure to mental health in public health training and the limited impact of this training in schools of public health on the production of mental health manpower and public health workers capable of performing mental health functions. Policy considerations for strengthening mental health in public health training are suggested.—*Journal abstract*.

3223. Paiva, Rosalia E.; Juan, Isabel R. & Haley, Harold B. (Southern Illinois U, Medical School) **Factors in internship choice.** *Journal of Medical Education*, 1974(Apr), Vol 49(4), 343-350.—Tested the assumption that in postgraduate medical education internships offered by different types of hospitals attract different types of individuals. An extensive questionnaire and 3

standardized psychometric instruments (the Gordon Survey of Interpersonal Values, the Study of Values test, and the Rokeach Dogmatism Scale) were administered to 535 senior medical students, divided into 3 groups by their choice of either a university, a municipal, or a private hospital for internship. It was found that this choice was mainly related to: (a) the medical school attended; (b) the relative importance the S placed on teaching, available residency programs, individual responsibility, and association with other physicians; (c) financial factors; (d) expressed choice of career and type of practice; (e) influence received from various individuals; (f) research experience while in medical school; and (g) some motivational patterns affecting relationships with others.—*Journal abstract*.

3224. Parlow, J. & Rothman, A. (U Toronto, Ontario, Canada) **Attitudes towards social issues in medicine of five health science faculties.** *Social Science & Medicine*, 1974(Jun), Vol 8(6), 351-358.—Developed the Attitudes Toward Social Issues in Medicine (ATSIM) scale, a Likert-type instrument, to assess attitudes toward social issues in health care. The 7 scales were named Social Factors, Doctor-Patient Relations, Paramedical Cooperation, Preventive Medicine, Government Role, General Liberalism, and Social Desirability. The ATSIM was administered to a total of 750 students in dentistry, medicine, nursing (undergraduate and postgraduate), pharmacy, and social work. Univariate analyses comparing medicine to each of the other groups showed significantly higher scores for nursing and social work than for medicine on almost all the ATSIM scales; medicine differed from dentistry on only 1 scale, and from pharmacy on 3 scales. Multivariate analyses showed that nursing and social work groups had similar attitudes, while dentistry, medicine, and pharmacy formed a separate cluster, scoring lower on all scales except Social Factors and Social Desirability. All 3 student groups for whom data were collected in each year of their program (social work, nursing undergraduates, and nursing postgraduates) showed a pattern of increasing ATSIM scores over their stay at university; this contrasts with other studies of medical and dental students, which have shown a deterioration in such attitudes. The ATSIM scales appeared to be sensitive differences among different health science faculties, as well as to intrafaculty differences among course years. (41 ref)—*Journal abstract*.

3225. Parlow, Jack & Rothman, Arthur I. (U Toronto, Faculty of Medicine, Ontario, Canada) **ATSIM: A scale to measure attitudes toward psychosocial factors in health care.** *Journal of Medical Education*, 1974(Apr), Vol 49(4), 385-387.—Describes the Attitudes Toward Social Issues in Medicine (ATSIM) scale, a 63-item Likert-type instrument intended for medical and health science students. The 7 scales of the ATSIM and their reliabilities are presented, and possible uses of the instrument are discussed.

3226. Patterson, Lewis E.; Hayes, Robert W. & McIntire, Paul R. (Cleveland State U, Coll of Education) **Careers in operation: Industry as a laboratory for counselor development.** *Counselor Education & Supervision*, 1974(Sep), Vol 14(1), 64-70.—Describes a guidance fellowship program in school counseling which is

conducted with workers of General Electric. Emphasis is placed on counselor contributions to career development, the characteristics of life within an industrial complex, sensitivity to the feelings of others, and the effects that counselors can have on these feelings, counseling theory and skills, and the psychology of vocational development. Selection and training processes and specific techniques used by the trainees for experiencing self and others are described.—*L. Gorsey.*

3227. **Plaut, Eric A.** (Indiana State Dept of Mental Health, Indianapolis) **A perspective on confidentiality.** *American Journal of Psychiatry*, 1974(Sep), Vol 131(9), 1021-1024.—Notes that the confidentiality of communications from psychiatric patients is threatened from many directions. The traditional stance of psychiatrists has been to proclaim total confidentiality as the principle and then to make exceptions. It is argued that, as third-party payers, peer-review structures, and governmental agencies erode the exclusively dyadic doctor-patient relationship, the traditional stance no longer suffices. What is needed is a thorough understanding of the forces involved and a set of principles to help assess the real needs for confidentiality in a variety of psychiatrist-patient interactions.—*Journal abstract.*

3228. **Richards, James M.** (Johns Hopkins U, Ctr for Social Organization of Schools, Careers Program) **Environmental psychology: A case study of scientific specialization.** *Center for Social Organization of Schools Report, Johns Hopkins University*, 1974(Sep), No 179, 11 p.—As a step toward understanding specializing in environmental problems, 73 environmental psychology researchers were compared with 109 interpersonal attraction researchers and with 179 psychologists in general on measures of current career and educational background. Both groups of researchers are more oriented than other psychologists to scientific aspects of psychology and less oriented to people-related aspects. Fewer differences were obtained between the 2 research groups, although the environmental psychologists seem somewhat more biologically and quantitatively oriented, perhaps a reflection of an ecological perspective. The clearest trend appears to be that a more heterogeneous area like environmental psychology will attract a more diverse group of researchers. (25 ref)—*Journal abstract.*

3229. **Schneider, Seymour.** **The autonomous functioning of Adlerian nonprofessionals.** *Individual Psychologist*, 1974(May), Vol 11(1), 1-3.—Explored the effectiveness of Adlerian nonprofessionals in 2 community-based family education centers. Results indicate that the Ss could discriminate the goals of a child's misbehavior significantly better than recently-graduated masters-level students and a matched group of untrained laymen. Implications of the study are discussed.

3230. **Shenkin, Budd N.** (US Dept of Health, Education, & Welfare, Office of the Assistant Secretary for Washington, DC) **Medical education, medical care, and society in Sweden.** *Journal of Medical Education*, 1974(Apr), Vol 49(4), 357-367.—Reports that Swedish medical education is nationally financed and organized; selection of students is centralized, objective, based on scientific aptitude, and keenly competitive. Enrollment, determined by legislation, has more than tripled since 1950. The curriculum is rigidly post-Flexnerian, but

social medicine is stressed. The national government adjusts medical training to serve both societal needs and professional interests. A 1969 reform resulted in a more tightly structured postgraduate education program. Medical students are state supported, well organized, and active in radical political movements. As in Swedish society at large, efforts to promote equality, integration, and democracy in the medical education process have met with limited success, as traditional values of objectivity and expertise impede some changes. Education produces experts rather than liberally educated citizens. Idealism remains strong, however, and its influence is an important force. (17 ref)—*Journal abstract.*

3231. **Signell, Karen A.** (San Mateo County Mental Health Services Div, North County Mental Health Ctr, Daly City, CA) **An interaction method of teaching consultation: Role-playing.** *Community Mental Health Journal*, 1974(Sum), Vol 10(2), 205-215.—Presents guidelines and suggestions for exercises for instructors using role-playing techniques in classroom settings, specifically courses in consultation procedures. First, instructors show standard techniques and how to handle awkward situations. The students first experience role-playing in the familiar role of therapist to differentiate therapy and consultation responses. Then they practice being consultants, anticipating certain pitfalls in consultation. Later, they role-play consultees and discover which consultation interventions work best. Class members generally set up their own role-playing, challenge the limits of each others' styles, and draw upon their role-life experiences in class as a model.—*Journal abstract.*

3232. **Singh, S. B. & Nigam, Asha.** (GSVM Medical Coll, Kanpur, India) **A comparative study of the personality profile of the male and female medical students.** *Indian Journal of Psychometry & Education*, 1973, Vol 4(1), 30-33.—Compared 30 male and 25 female medical students, using Kapoor's Hindi version of the 16 Personality Factor test. Results indicate that males were significantly warmer (Factor A), more sensitive (Factor I), more suspicious and jealous (Factor L), and more anxious (2nd order Anxiety) than females. Results are attributed to the greater responsibilities male professionals are called upon to bear in Indian society.—*J. B. Francis.*

3233. **Spence, Donald P.; Lugo, Marta & Youdin, Robert.** (New York U, Research Ctr for Mental Health) **Cardiac correlates of cognitive processing.** *Psychosomatic Medicine*, 1974(Sep-Oct), Vol 36(5), 420-437.—A 17-min passage taken from a simulated psychoanalytic interview was played to a group of 14 trained therapists, 10 therapists in training, and 16 inexperienced undergraduates who were alerted to the organizing theme (of termination of treatment) and asked to attend to direct and indirect references to this theme. Tonic heart rate (HR) averaged over 30-sec periods, was lower when clues were present than during control periods when clues were not present. Phasic HR (11-sec profiles) in the vicinity of each clue was significantly lower than profiles surrounding control passages. Profiles surrounding recalled clues were significantly lower than profiles surrounding control clues. Profiles surrounding more relevant clues were significantly lower than profiles

surrounding control clues whether or not the clue was recalled later. Findings suggest that decrease in mean HR can be used to mark the appearance of a significant stimulus even in cases where it does not appear in later recall; thus an on-line HR decrease may be a more sensitive index of stimulus processing than a later verbal report. Correlations were also found between HR change and clinical experience and between awareness of termination clues and clinical orientation.—*Journal abstract.*

3234. Tauber, Lewis E. **Specialties in professional practice.** *Ontario Psychologist*, 1974(Aug), Vol 6(3), 16-30.—Considers the identification of specialties and specialty functioning, the establishment of standards and specialty boards, and some of the issues involved.

3235. Turner, Edward V.; Helper, Malcolm M. & Kriska, S. David. (Ohio State U, Medical School) **Predictors of clinical performance.** *Journal of Medical Education*, 1974(Apr), Vol 49(4), 338-342.—50 3rd-yr medical students studying pediatrics were videotaped during their interview and physical examination of outpatients. Ratings based upon observed actions of the students in 3 areas thought to be components of clinical competence—communication skill, interpersonal skill, and physical examination skill—were summed to yield a composite variable which was correlated with 60 psychological traits and scores on 6 ability tests (e.g., the 16PF and the Medical College Admission Test). 11 of the 66 measures had significant correlations ( $p < .10$ ). Consideration should be given to the possible value of psychological tests as predictors of clinical competence. (16 ref)—*Journal abstract.*

3236. Ulman, Elinor & Levy, Bernard I. (George Washington U) **Art therapists as diagnosticians.** *American Journal of Art Therapy*, 1973(Oct), Vol 13(1), 35-38.—Discusses the theoretical role of the art therapist as a diagnostician. The philosophical and psychological background of such a role is presented, and the implications for education in art therapy are considered.

3237. Van Cott, Harold P. (American Psychological Association, Washington, DC) **Innovations in the transfer of psychological information: The communications programme of the American Psychological Association.** *Bulletin of the British Psychological Society*, 1972(Jul), Vol 25(88), 193-196.—Describes the origin, development, current status, and plans of the American Psychological Association's communications program, including both informal communications (conferences, etc) and publications and bibliographic information (through journals). The program appears to have been responsive to the needs of both basic and applied psychologists.

3238. Weinstein, Philip & Gipple, Cindy. (U Washington, Office of Research in Medical Education) **The relationship of study skills to achievement in the first 2 years of medical school.** *Journal of Medical Education*, 1974(Sep), Vol 49(9), 902-904.—Administered the Study Habits Inventory to 108 freshmen and 78 sophomore medical students. Study skills were more highly related to achievement (grade point averages) than to aptitude (Medical College Admission Test) scores; this relationship was stronger for freshmen than for sophomores. Results of a factor analysis of predictors of academic failure are also presented.

3239. Wiener, Stanley L. (State U New York, Medical School, Stony Brook) **Ward rounds revisited: The validity of the data base.** *Journal of Medical Education*, 1974(Apr), Vol 49(4), 351-356.—Describes a new format for ward rounds on a large medical service designed to correct deficiencies in history-taking, interviewing, and physical diagnosis techniques. Since the new format was instituted, a marked improvement has occurred in house staff performance in those areas. In addition, the new method has allowed for more vivid patient-based rounds and has minimized discussions which keep physicians away from the bedside. It is designed to emphasize basic clinical skills, observation, and reasoning, and may be used exclusively or intermittently with rounds based on case presentation.—*Journal abstract.*

## PHYSICAL AND PSYCHOLOGICAL DISORDERS

3240. Auger, Terrance J. & Auger, Sue E. (Illinois Dept of Mental Health, Herman) **Differences in perceptions of the seriousness of various behavior descriptors among mental health staff and others.** *Community Mental Health Journal*, 1974(Spr), Vol 10(1), 93-101.—Administered the Peterson-Quay Behavior Problem Checklist to a total of 147 professional staff members, teachers, and parents of emotionally disturbed and/or mentally retarded children in an inpatient treatment center. Ss ranked each of the 55 checklist items in terms of its judged importance in the mental health of children. Results show that 6 of the 17 behaviors associated with conduct problems appeared among the 10 most important items ranked by the parent sample; only 2 of these behaviors appeared among the 10 most important items ranked by the center's staff and the public school teachers. These findings suggest the validity of parents' perceptions of the seriousness of behavior disorders manifested by their own institutionalized children.—*Journal abstract.*

3241. Benton, Arthur L. (U Iowa) **Clinical neuropsychology of childhood: An overview.** In R. M. Reitan & L. A. Davison (Eds), *Clinical neuropsychology: Current status and applications*. Washington, DC: V. H. Winston & Sons, 1974. xiii, 417 p.—Briefly surveys neuropsychological studies of children and assesses their achievements, limitations, and prospects for elucidating the relations between behavior and the structure and functions of the nervous system.

3242. Boucebc, M. [About psychiatry in Algeria.] (Fren) *Acta Psychiatrica Belgica*, 1973(May), Vol 73(3), 427-433.—Presents a review of 13 doctoral dissertations dealing with various aspects of mental health in Algeria.

3243. Davison, Leslie A. (U California, San Francisco) **Current status of clinical neuropsychology.** In R. M. Reitan & L. A. Davison (Eds), *Clinical neuropsychology: Current status and applications*. Washington, DC: V. H. Winston & Sons, 1974. xiii, 417 p.—Discusses developments and practical problems in child and in adult clinical neuropsychology, considers the use of neuropsychological assessment as a study technique, and evaluates clinical-individual vs general knowledge in research studies as well as in patient categorization.

3244. Dement, William C. & Villablanca, Jaime. (Stanford U, Medical School) **Clinical disorders in man and animal model experiments.** In O. Petre-Quadens & J. D. Schlag (Eds), *Basic sleep mechanisms*. New York, NY: Academic Press, 1974. xix, 459 p. \$23.50.—Reviews data on primary, secondary, and interactive sleep disturbances and the indicated treatments for each. Primary disorders include the dyssomnias, the syndromes of drug dependency, and the syndromes of inadequate sleep. In secondary disorders the sleep disturbance is a direct consequence of a pathological condition, while in interactive disorders the disease manifestations, although of independent origin, are related to sleep stages or to prolongation of the recumbent position.

3245. Garcia, Eugene E. & DeHaven, Everett D. (U Utah) **Use of operant techniques in the establishment and generalization of language: A review and analysis.** *American Journal of Mental Deficiency*, 1974(Sep), Vol 79(2), 169-178.—Operant training techniques have been used successfully to establish and remediate speech and language behavior. Review of experimental reports suggests that an operant technology presently exists for establishing verbal imitation and can be used as a basis for training different forms of receptive and expressive speech. It is urged that research, especially in the newer areas of generative speech training and generalized speech usage, should continue to maintain the present momentum in the analysis of language development. (50 ref)—*Journal abstract*.

3246. Noel, B. & Revil, D. (Centre Hosp, Lab de Cytogénétique, Chambéry, France) **Some personality perspectives of XYY individuals taken from the general population.** *Journal of Sex Research*, 1974(Aug), Vol 10(3), 219-225.—Compared the psychological characteristics of 16 Ss having a 47,XYY chromosome, with those of a group of normal Ss who were matched for education, age, height, and socioeconomic status. XYY Ss had a certain degree of psychomotor difficulty, a lower level for emotional control, lower tolerance for inappropriate responses, and a less mature self-concept.—E. B. Jaffa.

3247. Parker, Elizabeth. (Special Hosp Research Unit, London, England) **The victims of mentally disordered female offenders.** *British Journal of Psychiatry*, 1974(Jul), Vol 125, 51-59.—Studied case records of 55 victims of 47 female offenders who committed murder, manslaughter, attempted murder, or wounding and who were found to be insane or admitted to a mental hospital. Of the 47 offenders, 39 attacked 1 person and 8 attacked 2 persons. 70% of the murder victims and 75% of the manslaughter victims were related to their assailants. 59% of the victims were male and 41% were female; males and females were equally represented in the murder and manslaughter groups, but the victims of attempted murder and wounding were predominantly male. Persons under 16 yrs of age constituted 2/5 of the victims and were more often victims of the fatal offenses, whereas the majority of the attempted murder and wounding victims were adults. Data on the place, time and method of attack are also discussed, and all findings are compared to previous studies of the characteristics of crimes by mentally disturbed persons.—L. Gorsej.

3248. Pillard, Richard C.; Rose, Robert M. & Sherwood, Michael. (Boston U, Medical School) **Plasma testosterone levels in homosexual men.** *Archives of Sexual Behavior*, 1974(Sep), Vol 3(5), 453-458.—Administered the Profile of Mood States to, and measured plasma testosterone levels in, 28 19-34 yr old male homosexuals. The Psychiatric Status Schedule was also completed for each S and background information was obtained in individual interviews. The overall mean testosterone levels for the homosexuals were somewhat lower than for a control group of heterosexual men, but the range of values for the 2 groups showed considerable overlap. Among the homosexuals, the 13 with some heterosexual experience had higher testosterone levels than the 15 without heterosexual experience. Testosterone levels were not related to relative masculinity or femininity or to any other psychological variables measured. (16 ref)—*Journal abstract*.

3249. Reitan, Ralph M. & Davison, Leslie A. (Eds.). (U Washington) **Clinical neuropsychology: Current status and applications.** Washington, DC: V. H. Winston & Sons, 1974. xiii, 417 p.

3250. Reitan, Ralph M. (U Washington) **Methodological problems in clinical neuropsychology.** In R. M. Reitan & L. A. Davison (Eds), *Clinical neuropsychology: Current status and applications*. Washington, DC: V. H. Winston & Sons, 1974. xiii, 417 p.—Uses empirical research data to outline methodological steps toward advancing knowledge of human brain-behavior relationships and, specifically, ways to predict neurological bases of behavioral deficits for individual patients.

3251. Tennent, Gavin; Loucas, Kypros; Fenton, George & Fenwick, Peter. (St Brendan's Hosp, Bermuda) **Male admissions to Broadmoor Hospital.** *British Journal of Psychiatry*, 1974(Jul), Vol 125, 44-50.—Examined demographic, diagnostic, and criminal records of 178 male consecutive admissions to Broadmoor Hospital, an English maximum security mental hospital for dangerous or violent patients. Findings were compared with those from 350 other offender and nonoffender psychiatric patients from an area mental hospital. There were more similarities than differences between the 2 offender groups, although fewer Broadmoor patients had had previous hospital admissions, and there was a longer interval between the present admission and previous hospitalizations for the Broadmoor Ss. Data on the relationship between diagnosis and type of offense are also presented.—*Journal summary*.

3252. Weijel, J. A. (U Amsterdam, Inst of Social Medicine, Netherlands) **The influence of social security in an affluent society on illness behaviour.** *Psychotherapy & Psychosomatics*, 1974, Vol 23(1-6), 272-281.—Argues that those who are somatically ill, psychosomatically disturbed, or psychosocially deficient are expelled from the labor market through the channel of the social security system and so cushioned against impoverishment. It is not wealth which decides illness behavior but the social security system which makes health care available for a whole population and prevents the pauperization of the lower classes. (17 ref)—*Journal abstract*.

3253. Zolt, Nathan. (U Illinois, Abraham Lincoln School of Medicine, Chicago) **Equivalence hypothesis of**

**mental and somatic processes: Clinical considerations.** *Diseases of the Nervous System*, 1974(Jul), Vol 35(7), 309-315.—Based on N. Zolt's (see PA, Vol 50:1387) initial article on the equivalence hypothesis of mental and physical processes, a discussion of clinical manifestations of disease, general treatment considerations, treatment procedures, and limitations of treatment is presented. The equivalence hypothesis argues that the brain is essentially an emotional organ, that every part of the brain is involved in emotional process formation, and that complex thought processes can be explained in terms of physiological functions. 5 characteristics of pain are outlined and related to characteristics of both disease and emotional states. Proper diagnosis and treatment depend on finding the proper balance of "afferent" and "efferent" systems in the body; methods of activating these systems in turn depend on assessing the proportions of direct, retrograde, and parallel activation and facilitating their balance.—L. Gorsey.

### Mental Disorders

3254. Aleksandrowicz, Jerzy W. (Cracow Medical Academy, Psychiatric Clinic, Poland) [An attempt to analyze the factors contributing to a change of diagnosis in neurotic patients.] (Germ) *Psychiatrie, Neurologie und medizinische Psychologie*, 1974(Feb), Vol 26(2), 111-112.—Discusses 3 types of clinical diagnosis of neurotic syndromes: (a) the primary, presenting diagnosis; (b) subdivision of the primary diagnosis into components which recognize the personality structure and etiological origins of the disturbance; and (c) diagnosis in an unofficial clinical jargon.

3255. Astrachan, Boris M.; Brauer, Lee; Harrow, Martin & Schwartz, Carol. (Yale U, Medical School) **Symptomatic outcome in schizophrenia.** *Archives of General Psychiatry*, 1974(Aug), Vol 31(2), 155-160.—Interviewed a total of 132 schizophrenic patients, treated on 6 inpatient units and discharged to the community, 2-3 yrs after discharge. Virtually no patients were symptom free. Only 5 were healthy on 3 neurotic and psychotic indexes (Gurin Mental Status Index, New Haven Schizophrenia Index, and the Psychiatric Evaluation Form). Approximately 1/4 of the entire sample had considerable symptoms of psychosis. Social class was most strongly related to symptomatic outcome. High social class was associated with better symptomatic outcome (particularly psychotic symptoms). Neurotic symptomatology was influenced by race. Psychotic symptomatology was also influenced by length of time in treatment and in drug therapy. Overall symptomatology and psychotic and neurotic factors were independent of marital status and other described predictive items, including age at onset, precipitating factors, family members ever in treatment, and depression and confusers during the index episode. (37 ref)—*Journal abstract*.

3256. Bach-y-Rita, George & Veno, Arthur. (Langley Porter Neuropsychiatric Inst, U California, San Francisco) **Habitual violence: A profile of 62 men.** *American Journal of Psychiatry*, 1974(Sep), Vol 131(9), 1015-1017.—Used questionnaire and psychiatric examination data to study 62 habitually violent patient-inmates from a prison population for life history and clinical variables. An extraordinarily high incidence of self-destructive

behavior and self-mutilation was found as well as a high incidence of childhood pathology suggestive of deprivation and neurological impairment in these patients. The population was also found to be heterogeneous, differing on several significant variables.—*Journal abstract*.

3257. Bach-y-Rita, George. (Langley Porter Neuropsychiatric Inst, U California, San Francisco) **Habitual violence and self-mutilation.** *American Journal of Psychiatry*, 1974(Sep), Vol 131(9), 1018-1020.—37% of a group of 22 habitually violent male patient-inmates were observed on admission to a special prison facility to have scars resulting from self-inflicted wounds. It was found that these men revealed considerable psychopathology beginning at an early age. The importance of identifying such patients and of treating them separately from other violent individuals is discussed. (19 ref)—*Journal abstract*.

3258. Battle, Allan O. (U Tennessee) **The psychological appraisal of a patient who had performed self-castration.** *British Journal of Projective Psychology & Personality Study*, 1973(Dec), Vol 18(2), 5-17.—Discusses the case history and test results of a 19-yr-old man who cut off his own penis. His responses to the Rorschach, Projective Wishes, and Draw-A-Person tests are presented in full and interpreted in the perspective of his family background, early history, medical record, and current interpersonal relations. This analysis suggests (a) severe conflicts concerning sexual impulses and masturbation guilt due to a rigid superego, (b) the breakdown of ego control in the presence of emotional stimuli, and (c) loss of reality contact in both the intellectual and emotional spheres.—J. Adams-Webber.

3259. Beck, Aaron. (U Pennsylvania) **Cognition, affect, and psychopathology.** In H. London & R. E. Nisbett (Eds), *Thought and feeling: Cognitive alteration of feeling states*. Chicago, IL: Aldine, 1974. 239 p. \$8.95.—Presents a classification of neurotic conditions based on the typical cognitive content of each of the disorders. Perseverative conceptualizations relevant to danger, loss, unjustified attack, and self-enhancement are typical of anxiety neuroses, depression, paranoid states, and hypomanic states, respectively. (15 ref)

3260. Behar, Lenore & Siringfield, Samuel. (U North Carolina, Chapel Hill) **A behavior rating scale for the preschool child.** *Developmental Psychology*, 1974(Sep), Vol 10(5), 601-610.—Attempted to provide a tool that could be used by preschool teachers and child-care workers to identify children who show symptoms that may suggest emotional disturbance. A modification of Rutter's Children's Behaviour Questionnaire was standardized on a sample of 496 normal and 102 emotionally disturbed preschool children. The modified questionnaire (renamed the Preschool Behavior Questionnaire) was found to possess criterion validity and high interrater and test-retest reliabilities. 3 factors were extracted and were labeled Hostile-Aggressive, Anxious-Fearful, and Hyperactive-Distractible. Data indicate that the Preschool Behavior Questionnaire may be valuable in either clinical or research settings for the first step in early detection of emotional problems. (22 ref)—*Journal abstract*.

3261. Bengtsson, G.; Fällström, K.; Jansson, B. & Nachemson, A. (U Göteborg, Sweden) **A psychological**

and psychiatric investigation of the adjustment of female scoliosis patients. *Acta Psychiatrica Scandinavica*, 1974, Vol 50(1), 50-59.—Studied the adjustment of 26 23-63 yr old women with an idiopathic scoliosis of a high degree (average curvature was 105°) by means of (a) a psychiatric interview, (b) a sociopsychological evaluation based on the patient's writings about her life and an unstructured interview, and (c) a personality evaluation based on scores on the Bender Gestalt Test and the Rorschach test. A synthesis was made of the different evaluations characterizing the patients' experience of disability according to a 4-grade scale. This variable was then related to important somatic variables. The patients' superficial psychosocial adjustment was very good; only 1 woman had an invalid pension and the psychiatric contact of the material only moderately exceeded the figure for other women with the same age distribution. However, results of the personality examination indicate that adjustment was not always so good. 2 case histories illustrate the discrepancy between a good superficial adjustment and a high-grade psychological handicap. The patients' lives were marked to a high degree by their deformity. The group was characterized by hypersensitivity and insecurity, with a tendency to dysphoric mood; the level of energy was high. Psychological adjustment deteriorated with an increasing degree of deformity. Poor vital capacity also impaired adjustment.—*Journal abstract*.

3262. Billig, Otto & Burton-Bradley, B. G. (Vanderbilt U, Medical School) **Psychotic "art" in New Guinea.** *Journal of Nervous & Mental Disease*, 1974(Jul), Vol 159(1), 40-62.—Compared spontaneous graphics by psychotic indigenous patients of various areas in New Guinea with those by psychotics from other cultures. The role of geometric designs, "inarticulated" structures, and the representation of space in the graphics is discussed, and possible psychodynamic and psychobiological factors in an individual's organization of reality are analyzed. (45 ref)

3263. Blackburn, Ivy M. (MRC Brain Metabolism Unit, U Edinburgh, Scotland) **The pattern of hostility in affective illness.** *British Journal of Psychiatry*, 1974(Aug), Vol 125, 141-145.—Tested 6 groups of patients ( $N = 106$ ) suffering from a bipolar or unipolar affective illness on a measure of hostility to differentiate between unipolar and bipolar depression and to study the pattern of hostility in mania. The groups were bipolar actively manic, bipolar recovered manic, bipolar actively depressive, bipolar recovered depressive, unipolar actively depressive, and unipolar recovered depressive. Results show that unipolar and bipolar depressives differed on extrapunitive while manics differed from both types of depressives in extra- and intropunitive. The changes occurring with recovery were also studied in each group, and the role of hostility in affective illness is discussed.—*Journal summary*.

3264. Blankenburg, W. (Heidelberg U, Psychiatric Clinic, W Germany) **[Fundamentals of the concept of an "anthropological proportion."]** (Germ) *Zeitschrift für Klinische Psychologie und Psychotherapie*, 1972, Vol 20(4), 322-333.—Presents a theoretical philosophical discussion of the ideas of L. Binswanger and others on the concept of an anthropological proportion and the

importance of these ideas for psychopathology. (English summary) (33 ref)

3265. Bottenberg, E. H. & Finster, H. (Niedersachsen Pedagogical Coll, Brunswick, W Germany) **[Child-rearing conditions and anxiety in children.]** (Germ) *Praxis der Kinderpsychologie und Kinderpsychiatrie*, 1974(Apr), Vol 23(3), 88-98.—Investigated the relationship between anxiety in children, measured by the Children's Anxiety Test (F. Thurner and U. Tewes), and various attitudes of mothers and teachers. Ss were 175 3rd and 4th graders of both sexes. Maternal attitudes were measured by the German form of the Parental Attitude Research Instrument (E. S. Schaefer and R. Q. Bell). Low but significant correlations were found between maternal child-rearing attitudes and child anxiety. Authoritarian personality in the mother also correlated with child anxiety to a low but significant degree; authoritarian personality in the teacher correlated to a low but very significant degree. Maternal punitiveness (as reported by the Ss) showed low correlation with anxiety, significant for girls only. In boys, anxiety was associated primarily with authoritarian attitudes; in girls, with attitudes of hostility and rejection. Basic dimensions of maternal child-rearing attitudes are discussed. (61 ref)—H. A. Euler.

3266. Burgess, Ann W. & Holmstrom, Lynda L. **Rape trauma syndrome.** *American Journal of Psychiatry*, 1974(Sep), Vol 131(9), 981-986.—Interviewed and followed 146 patients admitted during a 1-yr period to the emergency ward of a city hospital with a presenting complaint of having been raped. Based upon an analysis of the 92 adult women rape victims in the sample, existence of a rape trauma syndrome is documented, and its symptomatology as well as that of 2 variations, compounded reaction and silent reaction, is delineated. Specific therapeutic techniques are required for each of these 3 reactions. Crisis intervention counseling is effective with typical rape trauma syndrome; additional professional help is needed in the case of compounded reaction; and the silent rape reaction means that the clinician must be alert to indications of the possibility of rape having occurred even when the patient never mentions such an attack. (17 ref)—*Journal abstract*.

3267. Burke, Aggrey W. (U Birmingham, England) **Clinical aspects of attempted suicide among women in Trinidad and Tobago.** *British Journal of Psychiatry*, 1974(Aug), Vol 125, 175-176.—Reports that 90 of 350 psychiatric inpatients were admitted because of suicide attempts and 260 for other psychiatric reasons. Though the admission rate was high for 25-44 yr old nonsuicide patients, more of those attempting suicide were younger than those admitted for other reasons. Reasons for and methods of the suicide attempts are listed.

3268. Burlo, Jorge M. (French Hosp, Neurological Ctr, Buenos Aires, Argentina) **[Digital agnosia without acalculia in schizophrenia: Preliminary communication.]** (Span) *Acta Psiquiátrica y Psicología de América Latina*, 1974(Feb), Vol 20(1), 58-59.—Presents a preliminary report on 8 schizophrenic patients exhibiting digital agnosia without acalculia.

3269. Burstein, Alvin G.; Adams, Russell L. & Chapman, Loren J. (U Texas, Health Science Ctr, San Antonio) **Prognosis in schizophrenia: A 5-year follow-up.** *Journal of Nervous & Mental Disease*, 1974(Aug), Vol

159(2), 137-140.—Studied the prognostic power of the Elgin Prognostic Scale (EPS) using 3 criteria: hospital status (in or out) 9 mo after admission, hospital status after 5 yrs, and number of days in the hospital during 5 yrs. The EPS predicted 9-mo hospital status and days in the hospital over 5 yrs about equally well ( $r = .29$  and  $.30$ ). Heterosexual achievement, as indicated by either marital history or by item I of the EPS, predicted days in the hospital somewhat better ( $r = .41$  in each case). The EPS predicts somewhat more effectively when applied only to extreme groups.—*Journal abstract.*

3270. Burton-Bradley, B. G. (Div of Mental Health, Boroko, Papua New Guinea) **Social change and psychosomatic response in Papua New Guinea.** *Psychotherapy & Psychosomatics*, 1974, Vol 23(1-6), 229-238.—Posits that the rapidity of sociocultural changes in Papua New Guinea exceeds the tolerance thresholds of many individuals. By the cosmic and sociopolitical views of the people, they precipitate the clinical entities of the spirit-possession syndrome and of those associated with cargo cult activities. Cultural themes color and embellish the disease picture. Delusional states are predominantly grandiose, the result of technological disparity between the local and alien cultures.

3271. Byrne, Louis; O'Connor, Teresa & Faby, T. J. (St Loman's Hosp, Dublin, Ireland) **The home behaviour of schizophrenic patients living in community and attending a day centre.** *British Journal of Psychiatry*, 1974(Jul), Vol 125, 20-24.—Assessed 20 chronic schizophrenic patients attending a day centre and living at home on measures of illness behavior, work performance, productivity, and mental state. Concurrent illness behavior was measured in the home setting. The mean level of illness behavior reported by day center staff was not significantly different from that recorded at home interviews with patients' families. Correlations between home and day center behavior for individual patients were not significant, and the pattern of illness behavior at home was sometimes quite different from that at the day center. A high level of satisfaction among relatives was maintained at 2-yr follow-up. Although all patients improved somewhat in social performance, the poorest results were obtained with aggressive patients.—*Journal summary.*

3272. Cassano, G. B.; Castrogiovanni, P.; Conti, L. & Salis, G. (U Pisa, Inst di Clinica Psichiatrica, Italy) **[Automatic diagnostic procedures in psychiatry.]** (Ital) *Archivio di Psicologia, Neurologia e Psichiatria*, 1974(Jan), Vol 35(1), 61-76.—Describes psychiatric diagnoses obtained from a computer on the basis of a cross-sectional examination of the patient's symptomatology as rated by the Inpatient Multidimensional Psychiatric Scale. A psychopathological profile supplements the conclusions reached independently by discriminant analysis. A high degree of agreement between automatic and clinical diagnoses is noted.

3273. Cazzullo, C. L.; Smeraldi, E. & Penati, G. (Milan Medical School, Inst of Clinical Psychiatry, Italy) **The leucocyte antigenic system HL-A as a possible genetic marker of schizophrenia.** *British Journal of Psychiatry*, 1974(Jul), Vol 125, 25-27.—Investigated the human lymphocyte-antigen (HL-A) distribution in 53 unrelated Italian schizophrenics and 386 normal volun-

teers matched for geographic area and racial type. Results indicate more marked differences in HL-A distribution between schizophrenic groups than between overall schizophrenic Ss and controls. Hebeephrenic Ss showed a significantly higher frequency of HL-A<sub>1</sub> than paranoid Ss ( $p < .05$ ). Differences between control and schizophrenic Ss were not significant.

3274. Chailman, Alan. (U Minnesota, Medical School) **The empirical nature of worry.** *American Journal of Psychiatry*, 1974(Oct), Vol 131(10), 1140-1141.—Presents an 11-point operational definition which suggests that worry is a good example of self-inflicted suffering; it is so commonly experienced that it provides, for anyone who cares to introspect, a convenient opportunity for further self-understanding and thereby a reduction in personal suffering.

3275. Chipman, Abram & Paykel, Eugene S. (Boston State Hosp, MA) **How ill is the patient at this time? Cues determining clinician's global judgments.** *Journal of Consulting & Clinical Psychology*, 1974(Oct), Vol 42(5), 669-674.—Studied the relationship between an unstructured global rating of severity of illness and structured ratings of individual symptoms (e.g., Brief Psychiatric Rating Scale) in 278 25-60 yr old depressed women. Correlational analyses revealed that patients rated as more severely ill were those showing psychomotor retardation, depressive delusions, agitation, guilt, initial insomnia, hopelessness, suicidal tendencies, verbal complaint of depressed feelings and observed appearance of depression, and less short-term reactivity of mood. Findings suggest that patients showing greater severity on the core symptoms of depression and more characteristics of psychotic or endogenous depression are perceived as more ill. A multiple regression equation derived from 30 symptoms accounted for 56% of variance in the global scale.—*Journal abstract.*

3276. Chodoff, Paul. (George Washington U, Medical School) **The diagnosis of hysteria: An overview.** *American Journal of Psychiatry*, 1974(Oct), Vol 131(10), 1073-1078.—Outlines the 3 predominant conceptualizations of hysteria: that described by P. Briquet in 1859 and revived by current researchers, hysteria as a conversion symptom, and the idea of the hysterical personality. Psychoanalytic conceptualizations of hysteria—especially the idea of hysteria as the result of repressed sexuality—and explanatory models alternative to them are also reviewed. Although there is great confusion about the diagnosis of hysteria, it is concluded that the term itself is valuable for psychiatry. Suggestions for clarifying the concept include separating Briquet's hysteria and what has been termed the "hysterical personality" from their identification with hysteria and using the term in the diagnosis of hysterical conversion symptoms. (46 ref)—*Journal abstract.*

3277. Cocozza, Joseph J. & Steadman, Henry J. (New York State Dept of Mental Hygiene, Research Unit, Albany) **Some refinements in the measurement and prediction of dangerous behavior.** *American Journal of Psychiatry*, 1974(Sep), Vol 131(9), 1012-1014. Recent analyses of data on the Baxstrom patients (see PA, Vol 49:7655 and 7654 and Vol 59:5567) resulted in some refinements in the authors' measurement of dangerous behavior and in the finding that 2 factors, particularly in

combination, were highly related to subsequent arrest and dangerous behavior: (age—under 50 yrs—and score on the Legal Dangerousness Scale—a score of 5 or more). The implications of this finding for the prediction of dangerous behavior and the need for additional research are discussed. (17 ref)—*Journal abstract*.

3278. Cohen, David B. (U Texas, Austin) **On the etiology of neurosis.** *Journal of Abnormal Psychology*, 1974(Oct), Vol 83(5), 473-479.—Evaluated the concept of predisposition to neurosis within the context of 2 broad classes of interaction: (a) between organismic and socialization variables which produce relevant dispositions and (b) between these dispositions and current environmental conditions. It is suggested that treating abnormal behavior as a dependent rather than as an independent variable may be a useful approach in studying its etiology. Implications of this analysis for theoretical and methodological approaches to etiology of neurotic phenomena are discussed. (52 ref)—*Journal abstract*.

3279. Cohler, Bertram J. et al. **Social role performance and psychopathology among recently hospitalized and nonhospitalized mothers: II. Correlates with life stress and self-reported psychopathology.** *Journal of Nervous & Mental Disease*, 1974(Aug), Vol 159(2), 81-90.—Postulated that greater impairment in the performance of the roles of housewife, wife, mother, friend and neighbor, and daughter in one's own parental family, as measured by the Social Role Performance Instrument, would be associated with greater life stress and greater expressions of psychological distress, as measured by MMPI content scales. Within a group of 47 mothers recently discharged from a psychiatric hospital, the predicted relationship between life stress and impaired role performance did not appear, although this relationship was found within a sample of 18 nonhospitalized mothers in the community. A somewhat different relationship between psychological symptoms and impaired role performance was found within each of the 2 groups. Social withdrawal and psychotic symptoms, in particular, were more often associated with impaired role performance among former patients than among controls. (20 ref)—*Journal abstract*.

3280. Cormane, R. H. (U Amsterdam, Netherlands) **A molecular explanation of stress dermatitis.** *Psychotherapy & Psychosomatics*, 1974, Vol 23(1-6), 188-194.—Posits that, in contact dermatitis, delayed type allergy usually occurs in conjunction with immediate type. The latter response depends upon precipitation of antigen-antibody complexes within the vessel walls with subsequent fixation of complement and attraction of ancillary cells. All deposition mechanisms of immune complexes except the one involving hydrodynamic forces are mediated by vasoactive amines. The process may be hastened by release of vasoactive amines and hormones due to psychological reasons, stress, or trauma. As a consequence, it is understandable that release of sympathomimetic amines and hormones along with the presence of antigen may perpetuate cell-mediated immunity. (30 ref)

3281. Daut, Randall L. & Chapman, Loren J. (U Wisconsin, Madison) **Object sorting and the heterogeneity of schizophrenia.** *Journal of Abnormal Psychology*, 1974(Oct), Vol 83(5), 581-584.—Gave 126 schizo-

phrenics who were off drugs, 23 schizophrenics on drugs, and 52 nonpsychotic Ss a 30-item object-sorting test using D. Rapaport et al's passive sorting procedure. Inadequate responses were scored as Restrictive or Expansive. Some schizophrenics made predominantly Restrictive errors, and others made predominantly Expansive errors. Both chronic and newly admitted drug-free schizophrenics exceeded nonpsychotic Ss on the variance of the score of the difference between the 2 kinds of errors. Several potential statistical phenomena that often produce such heightened schizophrenic variance were ruled out. The test identifies patients with diverse error propensities and thus seems promising as a tool for seeking subdisorders within schizophrenia. —*Journal abstract*.

3282. Davis, William E. & Jones, Mark H. (VA Hosp, St Cloud, MN) **Negro vs Caucasian psychological test performance revisited.** *Journal of Consulting & Clinical Psychology*, 1974(Oct), Vol 42(5), 675-679.—Reports that in a group of 2,750 1st and 2nd admissions to the psychiatric unit of a Veteran's Administration hospital differences in proportion of Negroes vs Caucasians receiving schizophrenic, alcoholic, and depressive psychiatric diagnoses were found. Race, education (12 yrs or more vs 11 yrs or less), and diagnosis (schizophrenic vs nonschizophrenic) were varied. Contrary to past research, data from 160 Negro and Caucasian, schizophrenic and nonschizophrenic, and high- and low-educated patients under age 50 reveal no significant race-related main effects on the 9 MMPI clinical scales. Schizophrenics scored higher on the Paranoia (Pa) and Schizophrenia (Sc) scales, and poorly educated patients scored higher on Sc. Higher Pa and Sc scale scores were obtained from poorly educated Negroes but not from higher educated Negroes or Caucasians at both educational levels. Results are discussed in terms of education having an inculturating effect on minority groups and a selective process whereby poorly motivated minority group members drop out of school.—*Journal abstract*.

3283. de M'Uzan, M. **Psychodynamic mechanisms in psychosomatic symptom formation.** *Psychotherapy & Psychosomatics*, 1974, Vol 23(1-6), 103-110.—Considers that the genesis of the psychosomatic symptom is linked to an original psychic structure totally opposed to that of the neuroses. This structure is characterized by a deficiency, more or less marked, of the phantasmic activities which no longer, or very imperfectly, fulfil their functions of elaboration and integration.

3284. Dekker, Daniel J. & Webb, James T. (Ohio U) **Relationships of the Social Readjustment Rating Scale to psychiatric patient status, anxiety and social desirability.** *Journal of Psychosomatic Research*, 1974(Apr), Vol 18(2), 125-130.—Compared scores on the Social Readjustment Rating Scale (SRRS) made by 3 groups of Ss: 40 psychiatric inpatients, 40 psychiatric outpatients, and 40 normals. The relationship of the SRRS to 2 MMPI scales, Manifest Anxiety (At) and Social Desirability (So-R), was also evaluated. Results indicate significant differences in SRRS scores between the 2 patient groups and the normal group, but no significant differences between inpatients and outpatients. SRRS scores were significantly correlated with age, At, and So-R. It is concluded that self-reports of stressful life events are

related to the obtaining of psychiatric care. (18 ref)—*W. G. Shipman.*

3285. Depue, Richard A. & Dubicki, Margaret D. (Southern Illinois U, Carbondale) **Hospitalization and premorbid characteristics in withdrawn and active schizophrenics.** *Journal of Consulting & Clinical Psychology*, 1974(Oct), Vol 42(5), 629-632.—Obtained hospitalization and premorbid data on 20 withdrawn and 20 active schizophrenics (mean ages = 38.5 and 40.1 yrs, respectively) using the General Information Questionnaire to explore basic differences between these types of patients. Results show that withdrawns were first hospitalized at an earlier age, stayed in the hospital longer each time they were admitted, spent more of their lives in psychiatric facilities, and had a higher incidence of delusions and hallucinations than actives. Data reflect basic differences beyond the schizophrenic episode since withdrawns were also found to have a poorer overall premorbid adjustment, were less likely to be married, had fewer estimated friends between the ages of 6 and 18, and had fewer estimated high school activities than actives. (16 ref)—*Journal abstract.*

3286. Depue, Richard A. (Southern Illinois U, Carbondale) **The specificity of response interference to schizophrenia.** *Journal of Abnormal Psychology*, 1974(Oct), Vol 83(5), 529-532.—Recent research has emphasized that the greater-than-normal response interference in schizophrenics is a specific characteristic of schizophrenia. Since arousal is an important variable in response interference and since schizophrenics show patterns of overarousal, it is suggested that arousal would be important to control if behavioral differences between schizophrenics and controls are to be attributed specifically to schizophrenics' special problems of response interference. These ideas were tested by replicating a study by W. E. Broen and L. H. Storms (see PA, Vol 38:7261) using an overaroused control group of 15 nonpsychotic psychiatric inpatients, 15 nonparanoid schizophrenics, and 15 normals in a visual discrimination task. Data show that both the overaroused controls and schizophrenics, while not differing from each other, showed greater decrement of correct responding with increased arousal than the normal controls.—*Journal abstract.*

3287. Dirks, Stanley J. & Kuldau, John M. (Stanford U) **Validity of self-report by psychiatric patients of employment earnings and hospitalization.** *Journal of Consulting & Clinical Psychology*, 1974(Oct), Vol 42(5), 738.—Data from 50 control and 44 experimental male psychiatric ward patients show significant differences between the actual and self-reported number of previous hospitalizations for the experimental Ss and between the actual and self-reported length of hospitalization for the control Ss. Differences between self-reports and Social Security data on employment earnings were significant for experimental Ss.

3288. Dongier, M. (Allan Memorial Inst, Montreal, Quebec, Canada) **Psychosomatic aspects in myocardial infarction in comparison with angina pectoris.** *Psychotherapy & Psychosomatics*, 1974, Vol 23(1-6), 123-131.—Cites evidence from the literature that some psychodynamic features are more frequent than others in subjects prone to coronary heart disease. As personality changes

often take place following myocardial infarction, retrospective studies are less convincing than prospective ones. However, the latter point in the direction of predominance of obsessive-compulsive character defenses, more in myocardial infarction than in angina pectoris without myocardial infarction. Poverty of fantasy life, operational mode of mental functioning, repression, and control of emotional reactions appear predominantly in the former. (44 ref)—*Journal abstract.*

3289. Dorfman, Wilfred. **Depression and psychosomatic illness.** *Psychotherapy & Psychosomatics*, 1974, Vol 23(1-6), 87-92.—Current concepts of depression recognize that it may have genetic, constitutional, biochemical, neurophysiological, sociocultural, and psychodynamic factors. Depression can be overt and quite evident; in many instances it can be hidden by more noticeable somatic symptoms and even somatic disease. Concepts of psychosomatic illness have undergone considerable change in that the "specificity" theories which prevailed 30 yrs ago have been superseded by the current belief that all illness is psychosomatic and not limited to a few chosen ones. Depression is often interwoven with psychosomatic illness since it can be the trigger that precipitates a somatic illness as well as its result. (16 ref)—*Journal abstract.*

3290. Epstein, Leonard H. & Stein, David B. (Auburn U) **Feedback-influenced heart rate discrimination.** *Journal of Abnormal Psychology*, 1974(Oct), Vol 83(5), 585-588.—Used a discrimination paradigm to evaluate detection of heart-rate levels. 7 nonpsychotic psychiatric patients and 3 hospital employees were instructed to press a button when they detected a change in heart rate during a no-feedback, feedback, and 2nd no-feedback phase. Feedback was presented as points on a counter. Operant responding in the presence of both increased and decreased heart rate levels was monitored for each S. Results indicate that Ss did not reliably respond in the presence of the heart-rate levels prior to stimulus control feedback training. Accuracy of responding improved during feedback but decreased slightly at postfeedback. No differences were observed between operant responding to heart-rate increases or decreases. (17 ref)—*Journal abstract.*

3291. Fabrega, Horacio. **Problems implicit in the cultural and social study of depression.** *Psychosomatic Medicine*, 1974(Sep-Oct), Vol 36(5), 377-398.—Discusses Western disease depression to illustrate the relationship between psychiatric disease and social systems. 2 areas are covered: Part 1 is an analytical discussion of problems inherent in the field of cultural psychiatry. Part 2 addresses problems involved in the study of depression in Western nations. Epidemiological questions and factors involving the influence of social factors in the onset, duration, and manifestations of depression are discussed. (46 ref)—*Journal abstract.*

3292. Friessem, Dieter H. (Bürgerhospitals, Psychiatric Clinic, Stuttgart, W Germany) **[Psychiatric and psychosomatic diseases of foreign workers in the Federal Republic of Germany: A contribution to psychiatry of migration.]** (Germ) *Psychiatrie, Neurologie und medizinische Psychologie*, 1974(Feb), Vol 26(2), 78-90.—Presents demographic data on the more than 2 million foreign industrial workers in Germany in 1973. Incidence

of psychiatric illness is reported for the 5 nationalities with the largest number of immigrants. Turks, Greeks, Spaniards, Yugoslavs, and Italians had the highest percentage of illness, in that order. Turks were significantly higher in several diagnostic categories including neuroses, psychosomatic disorders, abnormal reactions, and attempted suicide. Spaniards were more often schizophrenic. Yugoslavs were more often alcoholics. (67 ref)—*K. J. Hartman*.

3293. **Fulker, D. W.** (U Birmingham, England) **A biometrical genetic approach to intelligence and schizophrenia.** *Social Biology*, 1973(Sep), Vol 20(3), 266-275.—Describes a method that permitted a reanalysis of existing data on schizophrenia and suggests that biometrical genetics could easily be applied to the analysis of human behavior. A brief account of this approach and its underlying assumptions is presented to illustrate the genetics of intelligence and schizophrenia. (29 ref)

3294. **Greden, John F.** (U Michigan, Medical Ctr) **Anxiety or caffeinism: A diagnostic dilemma.** *American Journal of Psychiatry*, 1974(Oct), Vol 131(10), 1089-1092.—Reports that high intake of caffeine ("caffeinism") can produce symptoms that are indistinguishable from those of anxiety neurosis, including nervousness, irritability, tremulousness, occasional muscle twitchings, insomnia, sensory disturbances, tachypnea, palpitations, flushing, arrhythmias, diuresis, and gastrointestinal disturbances. The caffeine withdrawal syndrome and the headache associated with it may also mimic anxiety. Patients with caffeinism will generally be identified only by routine inquiry into their caffeine intake. The psychiatrist should especially suspect caffeinism in patients who do not respond to psychopharmacological agents or who have psychophysiological complaints and recurrent headaches, chronic coffee-drinking patients on inpatient psychiatric services, and "hyperkinetic" children. 3 case reports illustrate the syndrome. (29 ref)—*Journal abstract*.

3295. **Hall, Charles P.** (Temple U, School of Business Administration) **Financing mental health services through insurance.** *American Journal of Psychiatry*, 1974(Oct), Vol 131(10), 1079-1088.—Outlines the historical development of health insurance in the US, noting how the social, technological, and financial constraints on the treatment of mental illness during the early years of private health insurance led to gaps in coverage for treatment of mental illness. Recent legislative proposals for national health insurance and major issues requiring research and resolution are reviewed.

3296. **Hartog, J.** (U California, San Francisco) **A transcultural view of sibling rank and mental disorder.** *Acta Psychiatrica Scandinavica*, 1974, Vol 50(1), 33-49.—Assumes that a transcultural view of the relationship between sibling rank and mental disorder might clarify discrepant East-West observations and point the way towards universal hypotheses. The range of psychological, social psychological, and physiological theories is discussed in terms of the author's observations in Malaysia. The author's biphasic hypothesis, which proposes elevated vulnerability to mental disorder for oldest and youngest siblings, is presented. It is argued that this hypothesis reconciles universal family psychodynamics with cultural variables, opens a valuable new

epidemiological approach to the problem, and refutes the view that sibling-rank differences are merely birthrate artifacts. Areas of research that might bridge the psychological-physiological gap are suggested, and the social and educational implications of sibling rank differences are noted. (41 ref)—*Journal abstract*.

3297. **Haynes, Stephen N.; Follingstad, Diane R. & McGowan, William T.** (U South Carolina) **Insomnia: Sleep patterns and anxiety level.** *Journal of Psychosomatic Research*, 1974(Apr), Vol 18(2), 69-74.—Conducted 2 studies to assess the sleep patterns, anxiety levels, and muscle tension levels of insomniacs and noninsomniacs. Study 1 involved the administration to 284 Ss of a Sleep Behavior Questionnaire (SBQ) and the Taylor Manifest Anxiety scale (MA scale). In Study 2 the SBQ and MA scale were given to 101 college students. Frontalis muscle activity was measured by electromyogram. Data from the 2 studies support the hypothesis that physiological arousal or anxiety is an etiological factor in insomnia, and suggest that anxiety-reducing procedures may be helpful in treating the problem.—*W. G. Shipman*.

3298. **Holzman, Phillip S. et al.** (U Chicago) **Eye-tracking dysfunctions in schizophrenic patients and their relatives.** *Archives of General Psychiatry*, 1974(Aug), Vol 31(2), 143-151.—Data from 103 psychiatric patients, 53 of their relatives, and 72 nonpatient controls who performed a simple test of smooth-pursuit eye tracking movements show a striking association between deviant eye tracking and clinically diagnosed schizophrenia. A high proportion of the schizophrenic patients' first-degree relatives who were not themselves clinically schizophrenic also showed deviant eye-tracking behavior. The relationship of poor eye tracking and schizophrenia is even stronger when specific psychological test evidence of thought disorder (WAIS and Rorschach Test) is used operationally to classify patients. The eye-tracking dysfunction may thus represent a genetic marker that can prove highly useful for studying the transmission of a vulnerability to schizophrenia. Findings suggest proprioceptive and interoceptive involvement in schizophrenic pathology. (23 ref)—*Journal abstract*.

3299. **Humphrey, John A.** (U North Carolina, Greensboro) **A study of the etiology of sociopathic behavior.** *Diseases of the Nervous System*, 1974(Sep), Vol 35(9), 432-435.—Tested the hypothesis that the incidence of early institutionalization (before age 16) among sociopaths will be significantly higher than for mental patients diagnosed as other than sociopathic. Ss consisted of 50 sociopaths and 59 non-sociopaths (32 paranoid schizophrenics and 27 psychoneurotics) drawn from the resident Caucasian male population of a state psychiatric hospital; most Ss were between 20 and 34 yrs of age. Findings from chart reviews confirm the hypothesis ( $p < .001$ ) and support the suggestion that childhood socialization which takes place under conditions of secondary relations between the child and socializing agents will be ineffective for the development of a self with an adequate role-taking ability. (22 ref)—*Journal abstract*.

3300. **Ikemi, Yujiro, et al.** (Kyushu U, Faculty of Medicine, Fukuoka City, Japan) **Psychosomatic mecha-**

nism under social changes in Japan. *Psychotherapy & Psychosomatics*, 1974, Vol 23(1-6), 240-250.—Notes that, after World War II, the sudden overthrow of the old social establishment and traditional value system in Japan, combined with the direct ill effects of modern industry, has exerted a serious influence upon the health of the Japanese people. Psychosomatic problems, including asthma and allergic disorders, are described in children and students, in females, in workers, and in the aged.

3301. Ineichen, Bernard & Hooper, Douglas. (U Bristol, England) **Wives' mental health and children's behaviour problems in contrasting residential areas.** *Social Science & Medicine*, 1974(Jun), Vol 8(6), 369-374.—A health survey conducted in 5 residential areas revealed comparatively good health among wives in a suburban commuter area. In contrast, a redeveloped central urban area produced a high level of neurosis among wives living in houses and behavior problems among children in high-rise apartments. Social factors which the families themselves associated with these results are discussed.

3302. Isaev, D. N. & Kagan, V. E. (Pediatric Medical Inst, Leningrad, USSR) **Autistic syndromes in children and adolescents.** *Acta Paedopsychiatrica*, 1974, Vol 40(5), 182-189.—Discusses several variants of autism (excluding childhood schizophrenia and Kanner's early infantile autism), stressing the specificity of the organization of cognitive processes, the inconsistency of behavior, and the strange nature of interests and communications characteristic of autistic psychopaths. Peculiarities of autistic manifestations within the framework of organic autism depend on insufficient psychic tension, underdeveloped space-time notions, insufficiency of intelligence as a whole, and the presence of epileptic seizures. Autism may also occur in the form of somatogenic or psychogenic reactions and pathological personality development. It seems to be a nonspecific syndrome of childhood. Peculiar clinical manifestations are associated with peculiarities of the basic disorder. Correlations of clinical, psychological, EEG, and pneumoencephalography data are suggestive of defects and distortions in the system of motivation and behavior planning.—G. Rubin-Rabson.

3303. Johnson, D. A. & Heather, B. B. (Crumpsall Hosp, Manchester, England) **The sensitivity of the Beck Depression Inventory to changes of symptomatology.** *British Journal of Psychiatry*, 1974(Aug), Vol 125, 184-185.—Interviewed 73 patients on 3 occasions from 7 days to 18 wks after exhibiting a new episode of depressive illness to test whether the Beck Depression Inventory can measure change in a depressive mood. Results suggest that the Inventory is sensitive to improvements of symptomatology which do not warrant a change of clinical rating.

3304. Jones, Fredric H. (U Rochester, Medical Ctr) **A 4-yr follow-up of vulnerable adolescents.** *Journal of Nervous & Mental Disease*, 1974(Jul), Vol 159(1), 20-39.—Attempted to develop predictors of severe psychopathology in early adulthood from behavioral descriptions provided in middle adolescence and early adulthood by parents. Ss were 24 males who were first seen in a psychology department clinic for behavioral problems in

middle adolescence. Assessment of adaptive adequacy at intake and follow-up was in terms of (a) a 4-fold grouping of Ss defined in terms of contrasting styles of coping, (b) the degree of social competence in a broad range of stimulus situations obtained from the cluster analysis of a structured joint parental interview, and (c) overall level of psychopathology obtained from the scaling of a brief description of the target child's behavioral assets and liabilities, which served as the outcome criterion. Prediction to the outcome criterion from the global rating of level of psychopathology at intake which separated those manifesting extreme or bizarre symptoms from the rest of the sample was .58. Two-thirds of the most inadequate category at follow-up were in the same category at intake. The strongest single predictors were 2 clusters assessing the child's cooperativeness, responsibility and maturity in relating to his parents. Prediction to the outcome criterion was increased to .87 by adding to the multiple correlation as predictor variables the global rating of degree of pathology at intake and the 2 dimensions of activity and locus inherent in the 4-fold grouping of Ss. (16 ref) —*Journal abstract.*

3305. Kaffman, Mordecai. **Toilet-training by multiple caretakers: Enuresis among kibbutz children.** *Israel Annals of Psychiatry & Related Disciplines*, 1972(Dec), Vol 10(4), 340-365.—In the Israeli kibbutz system of upbringing, several caretakers as well as the parents are responsible for the toilet training of children. It was assumed that (a) the transfer of the training functions to several theoretically neutral care-taking agents would reduce the pathogenic effects in toilet training of a contingent parent-child emotional conflict and (b) good achievements in sphincter control could be expected with the introduction into kibbutz child-rearing practices of progressive educational principles and psychologically oriented approaches to toilet training. An analysis of a representative sample of 1,376 4-18 yr old kibbutz children shows that Ss had a much higher reported incidence of enuresis up to age 6-7 yrs, and a lower incidence over age 10 yrs, in comparison to nonkibbutz children studied by previous authors. "Regressive" enuresis in response to stress-provoking situations in the parent-child relationship was relatively uncommon among kibbutz children. (22 ref)—*Journal abstract.*

3306. Kandabashi, Nobuharu. (Kyushu U, Faculty of Medicine, Fukuoka, Japan) **[Statistics on new neuropsychiatric patients at the Kyushu University Hospital: 1970.]** (Jpn) *Kyushu Neuro-psychiatry*, 1971(Oct), Vol 17(2), 107-112.—Presents diagnostic classifications of the patients at the neuropsychiatric division of a Japanese medical college. The trends suggest that social behavior problems are becoming the major reason for hospitalization in the neuropsychiatric division.

3307. Kaplan, Donald M. **On shyness.** *International Journal of Psycho-Analysis*, 1972, Vol 53(4), 439-453.—Describes the processes that may account for the various phenomena called shyness. Neurotic shyness is seen as a species of phobia, specifically social, having phenomenological and dynamic resemblances to depersonalization. The symptom is a continuity of a vivid fantasy activity retained at other moments in the patient's life. In neurotic shyness, a primal family

romance fantasy is specifically pathogenic. The regression in shyness from oedipal conflict is to an oral phase of primal anxiety which undoes consolidations of 8-mo "stranger anxiety." Though neurotic shyness resembles the bashfulness of schizophrenics phenomenologically, the dynamics differ. As a common factor in the etiology of shyness, it is concluded that there was an overt infantilizing contentiousness between parent and child. (58 ref)—R. S. Albin.

3308. Kay, Stanley R. & Singh, Man M. (Bronx State Hosp, NY) **A temporal measure of attention in schizophrenia and its clinical significance.** *British Journal of Psychiatry*, 1974(Aug), Vol 125, 146-151. —Developed the Span of Attention Test as a temporal measure of concentration and distractibility for studies with schizophrenics. The evaluation is determined by the average length of time the patient sustains attention at a routine motor task. The clinical value of the test was investigated by administering it to 66 schizophrenic inpatients and 23 nonpsychotic adults. Cross-sectional analyses found the test to distinguish between schizophrenics and nonschizophrenics and between paranoid and nonparanoid schizophrenics, and revealed significant correlations with indices of distractibility, arousal, and withdrawal. Longitudinal study showed the test to be a reliable instrument that monitors the differential course of chronic vs subacute and acute schizophrenics and may have prognostic significance for schizophrenic thought disorder.—*Journal summary*.

3309. Kety, Seymour S. (Harvard U, Medical School, Boston) **From rationalization to reason.** *American Journal of Psychiatry*, 1974(Sep), Vol 131(9), 957-963. —Stresses that psychiatry is a branch of medicine, that psychiatrists are physicians especially equipped to treat mental illness, and that the medical model of mental illness is valid, heuristic, and humanitarian. New data are presented bearing on the reliability of the diagnosis of schizophrenic illness and the importance of genetic factors in the transmission of that syndrome. It is argued that the medical model is as appropriate for the major psychoses as it is for diabetes. (18 ref)—*Journal abstract*.

3310. Kidd, K. K. & Cavalli-Sforza, L. L. (Yale U, Medical School) **An analysis of the genetics of schizophrenia.** *Social Biology*, 1973(Sep), Vol 20(3), 254-265. —Summarizes observers on the inheritance of schizophrenia presented that both genetics and environment contribute in an important way to the disease. Since the heterogeneity of the data makes an accurate analysis difficult, a resolution of the issues is unlikely to come from statistical techniques alone. Future advances in physiological, toxicological, and biochemical research are more likely to supply a firmer basis for understanding the genetic component of this disorder. A crude analysis of a threshold model, using a polygenic or a single-gene hypothesis, shows that both are in approximate agreement with the data. The single-gene hypothesis is thought to be more attractive at this stage of our knowledge. (27 ref)—R. S. Albin.

3311. Knobel, Mauricio. (U Buenos Aires, Medical School, Argentina) **Abnormality in normal development: A concern of symptom formation in childhood.** *Psychotherapy & Psychosomatics*, 1974, Vol 23(1-6), 35-42. —Utilizes the classic Freudian approach to symptom

formation in discussing basic conflicts with their corresponding anxieties. Normality and pathology become relative terms in child development and may or may not acquire the significance of a structured pathological system. The basic core of symptom formation relies in the interplay of conflictive ego-object relationships. Parental objects being primary structuring figures, the earlier conflicts stem from hampered maturational processes due to this pathological situation. 3 schematic types of somatization are described—hysterical, hypochondriacal, and psychotic—and several clinical cases are briefly presented. (16 ref)—*Journal abstract*.

3312. Kunz, Hans. [Experience, hallucinatory experience, and the certainty of death.] (Germ) *Zeitschrift für Klinische Psychologie und Psychotherapie*, 1972, Vol 20(4), 334-347. —Employs phenomenological analysis in a comparison of real experiences with delusory ones. An analogy is drawn between "primary delusion" and becoming aware of one's own death, and common characteristics of the 2 phenomena are specified. (English summary)

3313. Lader, M. H. & Marks, I. M. (U London, Inst of Psychiatry, England) **The rating of clinical anxiety.** *Acta Psychiatrica Scandinavica*, 1974, Vol 50(1), 112-137. —Divides the many scales and inventories that have been introduced for the rating of anxiety into those aimed at assessing "trait anxiety" (habitual anxiousness) and those designed to rate "state anxiety" (anxiety at that moment). The former are essentially personality inventories and include the MMPI, the Taylor Manifest Anxiety scale, the 16 Personality Factor Questionnaire, and the Eysenck Personality Inventory. Clinical rating scales are primarily mood assessment instruments and include simple linear scales, the Hamilton Anxiety Scale, the Lipman Scale, the Psychiatric Outpatient Mood Scales, the Cornell Medical Index, and the Morbid Anxiety Inventory. These scales together with many others are reviewed, their advantages and disadvantages are listed, and recommendations are made for the rating of trait and state anxiety. The importance of distinguishing between scales which establish diagnostic profiles and those which measure changes in the severity of symptoms is emphasized. (5 p ref)—*Journal abstract*.

3314. Lawrence, John E. (North Carolina State U) **Science and sentiment: Overview of research on crowding and human behavior.** *Psychological Bulletin*, 1974(Oct), Vol 81(10), 712-720. —Posits that, despite the increased salience of overcrowding as a social issue, it has generated little behavioral research among human Ss. Experimental evidence from the laboratory is slight and partly inconsistent; problems of definition and measurement obscure analysis in the field. A prevailing view, however, associates high population density with indexes of social and psychological malaise. This article reviews this position in light of seminal comparative and social experimentation. While it is considered difficult to draw firm conclusions from the existing meager body of data, the balance of evidence appears not to support any simple causal relationship between density and socio- or psychopathology. Prognoses of the horrors of overcrowding are judged to be imprecise and premature. Recent research has tended to distinguish between density and crowding, referring to the former in terms of

sociospatial factors and to the latter in terms of individual perception. It is suggested that any theory of crowding should encompass the intrapsychic case and that research should attempt to uncover evidence, if any, of neurophysiological responses to sociospatial variations in density. (58 ref)—*Journal abstract*.

3315. Leslie, Shirley A. (Booth Ball Hosp, Blackley, England) **Psychiatric disorder in the young adolescents of an industrial town.** *British Journal of Psychiatry*, 1974(Aug), Vol 125, 113-124.—Describes an epidemiological study of the prevalence of psychiatric disorder among 13-14 yr old children. Ss were a weighted sample of 150 children who were given a psychiatric examination and diagnosed; recommendations for treatment were made for each child on the assumption of unlimited facilities. The assessments were compared with previously administered parental questionnaire scores, and the prevalence rates were calculated. Because only 67.4% of the parental questionnaires were returned, a subsidiary study on a 1:5 sample of nonreturner was completed. Results of this procedure indicate that, particularly among the boys, the prevalence rate was much higher than that of the original sample. After adjustment for the nonreturners, the rates of severe disorder were 6.2 and 2.6% for boys and girls, respectively; for moderate disorder, the rates were 14.6% for boys and 11% for girls. A comparison between the current study and a previous one conducted among 10-11 yr olds in the Isle of Wight suggests that the higher rate in the current study is a feature of the area rather than of the age of the children and not due to different criteria for diagnosis. (15 ref)—*Journal summary*.

3316. Lesse, Stanley. **Psychiatric symptoms in relationship to the intensity of anxiety.** *Psychotherapy & Psychosomatics*, 1974, Vol 23(1-6), 94-101.—Notes that anxiety is a highly organized psychophysiologic process that follows definitive patterns that are predictable in a vast majority of patients. In a study of 624 patients over a period of 18 yrs it was found that the vast majority of patients, no matter what the nature of the original stress, demonstrate definite evidence of mounting anxiety before there is any evidence of other clinical psychiatric symptoms and signs. 4 components of anxiety—motor (tension), affective, autonomic, and verbal—are described quantitatively. Secondary psychiatric symptoms and signs in almost all instances begin to manifest themselves only after there is a definite appearance of the affective component. A symptom or sign does not disappear until the affective component of anxiety is decreased below a certain threshold. The last symptom or sign to appear is usually the first symptom or sign to disappear as the level of anxiety is reduced.—*Journal abstract*.

3317. Lifshitz, Michaela & Chovers, Atalya. **Encopresis among Israeli kibbutz children.** *Israel Annals of Psychiatry & Related Disciplines*, 1972(Dec), Vol 10(4), 326-340.—Analyzed the case records of 50 2-13 yr old children raised on an Israeli kibbutz who were referred to a child guidance clinic because of encopresis (fecal soiling) or fecal withholding. Results correspond to those previously published on soiling children raised in the city within the family framework. Findings tend to support the psychodynamic character of the symptom as a means

of gratification of needs in a child whose environmental contacts (parents and peers) are unsatisfactory. The symptom may also be caused by neuromuscular coordination that has not reached the level expected for the child's age and sex group. The prognosis is usually good even without direct therapeutic intervention. (16 ref)—*Journal abstract*.

3318. Lipsitt, Don R. (Mount Auburn Hosp, Cambridge, MA) **Psychodynamic considerations of hypochondriasis.** *Psychotherapy & Psychosomatics*, 1974, Vol 23(1-6), 132-139.—Argues that the term hypochondriasis must be considered, in its historical, medical, and sociological context, as a label misused extensively. Attempts at refinement of definition of terms such as hysteria, conversion reaction, somatization, psychophysiological, and psychosomatic diseases are cited; yet the theoretical issues involved are often defiant of clarification, and the problems in clinical differentiation remain complex. A case example of "hypochondriacal patient" illustrates the common clinical dilemmas experienced by patient, house staff, and physicians, the iatrogenic components of dysfunctional doctor-patient relationships, and some of the psychodynamic mechanisms related to the patient's mode of presentation, illness behavior, and ultimate disclosure of intrapsychic as well as psychosocial problems. (38 ref)—*Journal abstract*.

3319. London, Nathaniel J. **An essay on psychoanalytic theory: Two theories of schizophrenia: I. Review and critical assessment of the development of the two theories.** *International Journal of Psycho-Analysis*, 1973, Vol 54(2), 169-178.—Describes 2 main psychoanalytic theories of schizophrenia, the unitary theory and the specific theory. They appear incompatible with one another, yet both derive from Freud's classical theory of schizophrenia. The unitary theory ascribes primary roles to instinctual drives, anxiety, and defense, thus failing to encompass present knowledge of schizophrenic behaviors. The specific theory, on the other hand, cites the decathexis of the mental representation of objects. Suggestions for ways to confirm this theory are presented. (37 ref)—*Journal summary*.

3320. London, Nathaniel J. **An essay on psychoanalytic theory: Two theories of schizophrenia: II. Discussion and restatement of the specific theory of schizophrenia.** *International Journal of Psycho-Analysis*, 1973, Vol 54(2), 179-193.—Critiques the tendency within psychoanalysis to overextend crucial psychoanalytic concepts in the service of maintaining a cohesive unified theory. Psychoanalytic metapsychology is viewed as a group of interrelated but separable theories, derived from a common intrapsychic focus and from a common method. The unitary and specific theories of schizophrenia are discussed. Definitions of instinctual drives, object representations, and representations of time and space are provided, and brief histories of the 2 theories are included. (53 ref)—R. S. Albin.

3321. Maher, Brendan. (Harvard U) **Delusional thinking and cognitive disorder.** In H. London & R. E. Nisbett (Eds), *Thought and feeling: Cognitive alteration of feeling states*. Chicago, IL: Aldine, 1974. 239 p. \$8.95.—Presents a hypothesis about the origins of paranoid delusions which suggests that there is a group of patients who suffer from primary perceptual disorders, funda-

mentally biological but influenced by stress, and that these disorders involve vivid and intense sensory input. These experiences demand explanations which the patient develops through the same cognitive processes as found in normal theory-building. (24 ref)

3322. McNeil, T. F.; Persson-Blennow, I. & Kaji, L. (Malmö General Hosp, Sweden) **Reproduction in female psychiatric patients: Severity of mental disturbance near reproduction and rates of obstetric complications.** *Acta Psychiatrica Scandinavica*, 1974, Vol 50(1), 23-32. —Studied the relationship between degree of active maternal mental disturbance near reproduction and the total number of obstetric complications during 169 reproductions for 99 female psychiatric patients. The primary source of information on active mental disturbance was the psychiatric records of the patients. Degree of disturbance was rated on a 7-point general psychopathology scale, both for the 10 mo prior to delivery and for the 1st 10 mo postpartum. Degree of active maternal mental disturbance during pregnancy was unrelated to total number of obstetric complications. Degree of active maternal mental disturbance postpartum was slightly negatively related to total number of obstetric complications. Data do not support (a) the psychosomatic hypothesis of a relationship between maternal mental disturbance and somatic complications or (b) the hypothesis that obstetric complications are the intermediate link between severity of psychiatric disturbance in mothers and increased risk for disturbance in their offspring. (21 ref)—*Journal abstract*.

3323. McPherson, F. M.; Presly, A. S.; Armstrong, Jennifer & Curtis, R. H. (Royal Dundee Liff Hosp, Scotland) **"Psychoticism" and psychotic illness.** *British Journal of Psychiatry*, 1974(Aug), Vol 125, 152-160. —Administered a 29-item Psychoticism scale to 77 psychotic inpatients to test hypotheses relating Psychoticism and Extraversion to differences within the group of Ss. Results show that scores were largely unaffected by age, vocabulary, and sex; Psychoticism scale scores were independent of Neuroticism, although not of Extraversion and Lie scale, and were stable over time. Psychoticism scale scores did not discriminate between the psychotics and 35 neurotics and 112 normals. However, within the psychotic group, those patients who had delusions of "disintegration," thought disorder, and affective flattening had significantly higher scores than those psychotics without these signs. (22 ref)—*Journal summary*.

3324. Møllerup, E. T. & Rafaelsen, O. J. (Rigshospitalet, Psychochemistry Inst, Copenhagen, Denmark) **Heterogeneity and biochemical findings in manic-melancholic disorders.** *Acta Psychiatrica Scandinavica*, 1974, Vol 50(1), 104-111. —Attempts to find biochemical changes related to mental events are well known from the literature concerning manic-depressive psychosis. The most studied areas are probably carbohydrate, electrolyte, and neurotransmitter metabolism. The present article reviews the normal physiological connections which exist between different metabolic reactions belonging to these 3 areas. It is concluded that many different metabolic disturbances possibly might lead to the same mental disorders. It is also emphasized that lithium influences several of the reactions which might

be involved in these metabolic disturbances. (56 ref)—*Journal abstract*.

3325. Mezzich, Juan E.; Demarin, Fred L. & Erickson, James R. (Stanford U, Medical Ctr) **Comparative validity of strategies and indices for differential diagnosis of depressive states from other psychiatric conditions using the MMPI.** *Journal of Consulting & Clinical Psychology*, 1974(Oct), Vol 42(5), 691-698. —Used as source of data the MMPI protocols of 223 18-60 yr old psychiatric inpatients randomly divided into 2 groups for a double cross-validation design, clinical diagnosis of depressive vs nondepressive states as criterion, and multiple regression as the main analytic technique. The individual validity of MMPI scales constructed through empirical (external criterion), purely intuitive, and intuitive plus internal consistency techniques was lower than the validity of regression models. The validity and cross-validity of regression equations obtained from several different sets of scales including "linear models" composed of single scales and "configural models" that included their binary cross-products was very similar across models and across construction techniques of the component scales. A simplified regression formula is provided for diagnostic purposes. (18 ref)—*Journal abstract*.

3326. Mischel, Theodore. (State U New York, Binghamton) **Understanding neurotic behavior: From "mechanism" to "intentionality."** In T. Mischel (Ed), *Understanding other persons*. Totowa, NJ: Rowman and Littlefield, 1974. xv, 266 p.—Notes that there is much in Freud's clinical writings, particularly in the metapsychology, which suggests an attempt to conceptualize neurosis in terms of models drawn from the physical sciences. Freud's interpretation of neuroses as being traceable "back to an excessive repression of libidinal trends" is examined, and the concept of neurotic defenses as techniques of self-deception is explored. (4 p ref)

3327. Morrison, James R. (U California, San Diego) **Bipolar affective disorder and alcoholism.** *American Journal of Psychiatry*, 1974(Oct), Vol 131(10), 1130-1133. —Reports that the percentage of manic-depressive patients ( $N = 297$ ) admitted to an acute care psychiatric service who were also diagnosed as alcoholic (36%) was not significantly different from the rate of alcoholism for the entire psychiatry service ( $p < .02$ ). Demographic factors, symptoms, and course of the affective illness did not distinguish alcoholic from nonalcoholic patients. Data do not support a causal relationship between the 2 illnesses, both of which might be considered "primary" in an individual patient.—*Journal abstract*.

3328. Munoz, Rodrigo A. **One hundred private psychiatric patients.** *Diseases of the Nervous System*, 1974(Aug), Vol 35(8), 358-361.—Explored the demographic and clinical characteristics of 100 clients treated by private psychiatrists. Interviews and observations indicate that most Ss had discrete psychiatric disorders and affective disorders, and sought attention because of emergency situations.

3329. Murphy, George E.; Woodruff, Robert A. & Herjanik, Marijan. (Washington U, Medical School) **Primary affective disorder: Selection efficiency of two sets of diagnostic criteria.** *Archives of General Psychia-*

try, 1974(Aug), Vol 31(2), 181-184.—115 patients whose conditions were diagnosed as primary affective disorder were followed up prospectively after a 5-yr interval. The patients were reinterviewed blindly, and 86% were given the same diagnosis at follow-up, evidence of the diagnostic validity of the criteria used for primary affective disorder. The efficiency of criteria recently developed by J. P. Feighner et al (1973) were compared with criteria used in initial evaluation of the patients' conditions by W. Cassidy et al (1957). Within the limits of this study, there is evidence that the Feighner criteria are more inclusive in selecting patients with primary affective disorder with no loss of diagnostic validity.—*Journal abstract.*

3330. Nagaraja, Jaya. **Somnambulism in children: Clinical communication.** *Child Psychiatry Quarterly*, 1974(Jan), Vol 7(1), 18-19.—Discusses somnambulism and its etiology in children. The etiology includes the take-over of activities and direction by the subconscious. 2 case histories are presented. An 8-yr-old boy had several such episodes each night. 3 wks of in-patient treatment on a tranquilizer, followed by 6 wks of the drug on an outpatient basis resulted in a symptomatic recovery for 2 yrs. A 9-yr-old girl who had been sleep walking for 6 mo also responded to tranquilizer treatment.—*R. S. Albin.*

3331. Nolan, J. Dennis. (Ohio State U) **A within-subjects analysis of discrimination shift behavior in schizophrenics.** *Journal of Abnormal Psychology*, 1974(Oct), Vol 83(5), 497-511.—In 3 experiments, 24 20-68 yr old chronic schizophrenics, 12 20-66 yr old new admissions, 12 18-46 yr old predischARGE patients, and 4 49-56 yr old lobotomized patients were trained on 1 of 4 discrimination-learning tasks, followed by either a reversal-intradimensional-extradimensional shift sequence or an extradimensional-extradimensional-reversal shift sequence. Shift means and subproblem-learning curves indicated that some attentional responding did occur, but that some Ss found it difficult to respond to familiar stimuli in a new way. No differences between patient subgroups were obtained, but individual differences in attention suggest meaningful subvarieties of patients. It is concluded that a within-Ss discrimination shift paradigm can provide useful information about attentional responding, perseverative responding, and ability to deal with familiar stimuli in a new way. (28 ref)—*Journal abstract.*

3332. Offord, D. R. (U Ottawa, Ontario, Canada) **School performance of adult schizophrenics, their siblings and age mates.** *British Journal of Psychiatry*, 1974(Jul), Vol 125, 12-19.—Analyzed school records of 51 male and 65 female adult schizophrenics, their 247 male and female siblings, and 116 age-matched controls. 3 types of data were assessed: frequency of repeating, IQ scores, and last regular grade completed. Male schizophrenics' school performance was inferior to that of female schizophrenics on all 3 measures. Male schizophrenics, but not females, did significantly more poorly in school than their age-matched controls, and there was a sizable group of low-IQ males but not of females. Within-family data show that the preschizophrenic differed consistently on school performance from his siblings and age mates only when he was a male

belonging to a low-IQ sibship. (22 ref)—*Journal summary.*

3333. Ornitz, Edward M. et al. (U California, Medical School, Los Angeles) **The recovery cycle of the averaged auditory evoked response during sleep in autistic children.** *Electroencephalography & Clinical Neurophysiology*, 1974(Aug), Vol 37(2), 173-174.—Studied the recovery cycle of the averaged auditory evoked response (AER) during sleep in 28 autistic and 23 normal 22-68 mo old children by measuring the amplitudes and latencies of wave N<sub>1</sub> of the 1st response (R<sub>1</sub>) and the 2nd response (R<sub>2</sub>) to paired clicks. No significant differences in the recovery ratios (R<sub>2</sub>: R<sub>1</sub>) were found between autistic and normal children in either Stage 2 or REM sleep at within-pair stimulus separations of 250, 160, 80, and 40 msec. (French summary)—*Journal summary.*

3334. Overall, John E. (U Texas, Medical Branch, Galveston) **Validity of the Psychological Screening Inventory for psychiatric screening.** *Journal of Consulting & Clinical Psychology*, 1974(Oct), Vol 42(5), 717-719.—Administered the Psychological Screening Inventory to 126 adult psychiatric outpatients. Responses were scored using R. I. Lanyon's clinical scales and J. E. Overall's recently derived factor scoring keys. Responses of 800 normal adults were similarly scored by the 2 methods. Discriminant function analysis revealed 18% misclassification for clinical scale scoring and 22% misclassification for factor scoring. The hit rates are considered appropriately high in view of criterion uncertainty. As in similar studies with other instruments, factor analysis did not provide a superior basis for discriminant validity.—*Journal abstract.*

3335. Pethö, Bertalan. ("Semmelweis" Medical U, Psychiatric Clinic, Budapest, Hungary) **[Nosological aspects of schizophrenia: I. Toward the solution of the problem of a stabilized nosological category.]** (Germ) *Psychiatrie, Neurologie und medizinische Psychologie*, 1974(Mar), Vol 26(3), 136-143.—Reviews the historical process of a more flexible concept of schizophrenia. E. Kraepelin's dichotomy of endogenous psychoses and E. Bleuler's psychogenetically oriented explanation are considered. The current crisis in symptomatology and the formal revival of nosological characteristics are summarized.

3336. Pinard, G. & Tetreault, L. (Inst National de la Recherche Scientifique, Hôpital Saint-Jean de Dieu, Montréal, Ontario, Canada) **[Evaluation of syntactic complexity in psychotic depression.]** (Fren) *Revue de Psychologie Appliquée*, 1974, Vol 24(2), 103-117.—Reports further developments in earlier research (see PA, Vol 50:7472) in measuring depression from aspects of patient's speech. Syntactic structural complexity of the speech of 10 depressed psychotics revealed statistically significant differences between the frequency of incomplete sentences spoken and other related measures during depression and after recovery. Over a 4-wk period, sentences tended to become more complete and more complex in structure.—*K. J. Hartman.*

3337. Pinkerton, Philip. (U Liverpool, Inst of Child Health, England) **Symptom formation reconsidered in psychosomatic terms.** *Psychotherapy & Psychosomatics*, 1974, Vol 23(1-6), 44-53.—Presents a system for classify-

ing physical symptoms in childhood disorder under 3 main headings: (a) the somatopsychic sequence in which the basic substrate is an organic lesion giving rise to intellectual and emotional repercussions; (b) the pseudosomatic sequence in which the symptom presentation, though physical, has a basis of purely emotional pathology; and (c) the psychosomatic sequence which should be retained for those specific disorders like asthma, eczema, migraine, and spastic colon which have a pathophysiological substrate activated by emotional factors. The principle common to all 3 syndromes is that symptom formation is dependent upon the lesion itself and upon the child's and parent's attitudes toward it. (22 ref)—*Journal abstract*.

3338. Post, Robert M. & Goodwin, Frederick K. (National Inst of Mental Health, Adult Psychiatry Branch, Bethesda, MD) **Estimation of brain amine metabolism in affective illness: Cerebrospinal fluid studies utilizing probenecid.** *Psychotherapy & Psychosomatics*, 1974, Vol 23(1-6), 142-156.—To assess central serotonin and dopamine metabolism in 26 patients with affective illness and 8 heroin addicts on methadone, cerebrospinal fluid amine metabolites 5-hydroxyindoleacetic acid (5HIAA) and homovanillic acid (HVA) were measured under baseline conditions and after probenecid administration. 5HIAA and HVA accumulations were increased by the respective amine precursors, tryptophan and levodopa and were decreased by inhibitors of synthesis, parachlorophenylalanine, and  $\alpha$  methylparatyrosine. In depressed and manic patients, 5HIAA levels were similar to those in 7 normal controls, while probenecid-induced accumulations of 5HIAA tended to be lower than those in controls. HVA accumulation in depressed patients was low compared to that in controls. Amitriptyline and imipramine treatment significantly lowered 5HIAA accumulation, suggesting that the tricyclic antidepressants decrease central serotonin turnover. (88 ref)—*Journal abstract*.

3339. Quinlan, Donald M. & Harrow, Martin. (Yale U) **Boundary disturbances in schizophrenia.** *Journal of Abnormal Psychology*, 1974(Oct), Vol 83(5), 533-541.—Studied 4 types of index associated with the concept of "boundary" with 171 psychiatric inpatients who were tested with the Rorschach and independently assessed on other aspects of psychopathology (e.g., measures of depersonalization, stimulus overinclusion, and derealization). Contaminations and fabulized combinations were correlated with indices of pathology from Rorschach and with other psychopathology measures. Penetration scores were unrelated to pathology. Contaminations were more frequent in schizophrenics than in any more frequent among schizophrenics and latent schizophrenics than in depressives. Penetration responses were less frequent in depressives than in any other group. Support was found for the hypothesis that schizophrenics give certain types of responses considered indicative of boundary disturbance such as contamination responses. (35 ref)—*Journal abstract*.

3340. Raskin, David E. & Sullivan, Kathleen E. (U Washington) **Erotomania.** *American Journal of Psychiatry*, 1974(Sep), Vol 131(9), 1033-1035.—The unusual

syndrome of erotomania consists of a delusional belief, usually in a woman, that an older man of higher social status is in love with her. The few cases of erotomania described in the literature are reviewed, 2 new cases are presented, and new dimensions in understanding this condition are discussed.

3341. Rees, W. Linford. (St Bartholomew's Hosp, London, England) **Personality and psychodynamic mechanisms in migraine.** *Psychotherapy & Psychosomatics*, 1974, Vol 23(1-6), 111-121.—Discusses the complex etiology of migraine and the psychological factors which are either predisposing or precipitating causes of migraine—personality attributes, neurosis and other psychiatric disorders, emotional reactions, changes in life situation, various psychosocial stresses, and periods of overactivity. Mood changes which may accompany an attack of migraine are associated with alterations in energy, concentration, and ability to work. There may also be a somatopsychic sequence of events in which the sufferer may react in various ways to an attack of migraine just as he may react to any other illness or disability. (20 ref)—*Journal abstract*.

3342. Ritzler, Barry & Rosenbaum, Gerald. (U Rochester) **Bilateral transfer of inhibition in the motor learning of schizophrenics and normals.** *Journal of Motor Behavior*, 1974(Sep), Vol 6(3), 205-215.—Evaluated bilateral transfer of the effects of massed practice in motor learning for an adjusted sample of 36 male chronic undifferentiated schizophrenics and 36 normal hospital staff and psychology student matched controls. Ss were trained and tested on a rotary pursuit task under 2 bilateral transfer conditions—rest and no-rest—and 1 nontransfer control condition. Normal Ss demonstrated positive reminiscence scores in the rest condition and significant transfer of inhibitory effects in the no-rest condition. Schizophrenics on the other hand, showed no significant transfer of inhibition. Results are discussed as supporting the hypothesis of a proprioceptive deficit in schizophrenia involving central integrating mechanisms. Such findings also suggest that a proprioceptive deficit might be a significant underlying factor in the cognitive dysfunction and body image disturbances of schizophrenia, processes which also can be explained by impairment in central integrating mechanisms. (18 ref)—*Journal abstract*.

3343. Roback, Howard B.; Webb, Warren W. & Strassberg, Donald. (Vanderbilt U, Medical School) **Personality differences between fee-paying and non-fee paying patients seen for psychological testing.** *Journal of Consulting & Clinical Psychology*, 1974(Oct), Vol 42(5), 734.—Administered the MMPI to 17 21-62 yr old male patients who did not pay their clinic bills and 17 patients who did pay their bills. MMPI and clinical data suggest greater reality disturbance and distortion for the non-fee paying group than for the fee-paying group, and that fee-payment behavior is situationally determined and not a generalized characteristic.

3344. Saccuzzo, Dennis P.; Hirt, Michael & Spencer, Terry J. (Middle Tennessee State U) **Backward masking as a measure of attention in schizophrenia.** *Journal of Abnormal Psychology*, 1974(Oct), Vol 83(5), 512-522.—Compared backward-masking functions for 2 groups of 16 schizophrenics with the masking functions for 2

control groups (8 undergraduates and 8 nonschizophrenic psychiatric patients). Masking functions were obtained for both single-letter and 8-letter visual displays. The procedure involved a forced-choice letter recognition method analogous to signal detection methodology. Both schizophrenic groups produced longer masking functions, under all conditions, than the 2 control groups whose functions were highly similar. Consistent with "attention" theories of schizophrenia, results indicate that some deficit occurs in schizophrenia at a very early stage of information-processing in the visual system. (22 ref)—*Journal abstract*.

3345. Schless, A. P.; Mendels, J.; Kipperman, A. & Cochrane, C. (U Pennsylvania) **Depression and hostility.** *Journal of Nervous & Mental Disease*, 1974(Aug), Vol 159(2), 91-100.—Studied 37 depressed patients to explore the association between depression, hostility, and the direction in which hostility is expressed. A spectrum of hostile behaviors was found, defined by 4 factors, with an approximately equal number of patients turning hostility inward and outward. In patients who tended to turn hostility in, there was a relationship between the degree of turning hostility inward and higher scores on several measures of the severity of depression. Several indicators of outward hostility were related to presence of hysterical features and resentment. These tentative findings are in keeping with a theory which considers depression to be primarily an emotional signal and hostility to serve as a defense. There is evidence that the defense may fail as depression becomes more severe. (38 ref)—*Journal abstract*.

3346. Schlossberg, Arie & Rattok, Yaacov. (Tel Aviv U, Israel) **The autokinetic phenomenon in schizophrenics.** *Israel Annals of Psychiatry & Related Disciplines*, 1974(Jun), Vol 12(2), 138-144.—Exposed 26 acute and 46 chronic schizophrenic patients to the autokinetic phenomenon; acute and chronic Ss were further divided into 14 acute and 18 chronic paranoids and 12 acute and 28 chronic nonparanoids. All Ss were 18-40 yrs old, and were receiving phenothiazines. Significant differences were found between all subgroups, except in the cases of chronic nonparanoids vs chronic paranoids and acute paranoids vs a previously reported normal control group ( $p < .05$ ). Results are discussed in terms of ego autonomy and an ego closeness-distance continuum. The autokinetic phenomenon appears useful in differentiating acute paranoids from nonparanoid schizophrenics, thus supporting research which defines paranoids as a distinct diagnostic subgroup.—*Journal abstract*.

3347. Schott, Gerhard & Dietze, Rosemarie A. (Charité Nerve Clinic, Berlin, E Germany) [**The de la Tourette syndrome.**] (Germ) *Psychiatrie, Neurologie und medizinische Psychologie*, 1974(Mar), Vol 26(3), 176-182.—Reports 2 cases of the rare Gilles de la Tourette syndrome. Problems related to localization of subcortical atrophy and problems of nosology are discussed.

3348. Shapiro, M. B. & Post, F. (U London, Inst of Psychiatry, England) **Comparison of self-ratings of psychiatric patients with ratings made by a psychiatrist.** *British Journal of Psychiatry*, 1974(Jul), Vol 125, 36-41.—Conducted 4 single-case experiments to assess the psychiatrist's ability to predict the degree of symptom intensity reported by 4 psychiatric patients, each with a

long-term nonpsychotic affective disorder. The psychiatrist's predictions were based on interviews with each S, conducted either immediately before or after the patient had reported the intensity of his own symptoms on the Personal Questionnaire (PQ). The psychiatrist also completed the PQ and results were compared with the patient's own responses. 6-17 separate testing sessions were completed and each S was rated on 20-29 different symptoms in each session. The psychiatrist's predictions were exactly correct approximately 60% of the time, and were within 1 scale point at least another 25% of the time. Discrepancies between the psychiatrist and the patients were not related to content but rather to the degree of symptom severity, with accuracy being greater at extreme intensities than in the middle range.—*Journal summary*.

3349. Shean, Glenn; Faia, Christine & Schmaltz, Eileen. (Coll of William & Mary) **Cognitive appraisal of stress and schizophrenic subtype.** *Journal of Abnormal Psychology*, 1974(Oct), Vol 83(5), 523-528.—Studied differences in patterns of cognitive appraisal and response to stress in a total of 19 male nonparanoid process schizophrenics and paranoid reactive schizophrenics. Paranoids evidenced greater heart-rate response to stress stimuli while rating the stress categories as less disturbing than did nonparanoid Ss. Comparison of autonomic measures and verbal ratings of the slides indicated that paranoids underrated their autonomic response to stress stimuli while nonparanoid Ss overrated it. Results support the clinical literature on defensive styles of the 2 groups. (15 ref)—*Journal abstract*.

3350. Solyom, L.; Beck, P.; Solyom, C. & Hugel, R. (Allan Memorial Inst, Montreal, Quebec, Canada) **Some etiological factors in phobic neurosis.** *Canadian Psychiatric Association Journal*, 1974(Feb), Vol 19(1), 69-78.—Studied 47 phobic psychiatric outpatients who were matched for age, sex, marital status, and education with 47 normal persons. 43 of the 47 patients had agoraphobia; the others had specific phobias. 45% of the normals had fears of snakes, heights, spiders, or bees, but these fears caused them no problems; 1 normal S had a mild agoraphobia. Mothers of phobics were more often neurotic and fearful than mothers of normals, and phobic patients had been more fearful as children. On the average, patients developed the phobic symptom at age 20; fearful normals developed their fears at age 11. Phobias of patients typically began following a trauma in adulthood (e.g., separation or death of a loved-one). The train and tunnel phobias of 2 male patients had not been extinguished despite their daily commuting by train through a tunnel. Findings contradict the view that phobias are produced and maintained by conditioning. It is suggested that agoraphobia derives from the reactivation of separation anxiety, whereas specific phobias derive from conditioned responses. (French summary) (24 ref)—*F. Auld*.

3351. Standage, K. F.; Moore, J. A. & Cole, M. G. (Memorial U Newfoundland, St John's, Canada) **Self-mutilation of the genitalia by a female schizophrenic.** *Canadian Psychiatric Association Journal*, 1974(Feb), Vol 19(1), 17-20.—Describes the case of a 20-yr-old single woman in whom self-mutilation of the genitalia was associated with the development of schizophrenia. The

psychopathology was dominated by sexual themes and resembled reports of patients with erotomania in the setting of a paranoid or schizophrenic psychosis. The literature on genital mutilation by both male and female patients is briefly reviewed. It is suggested that such behavior in women indicates severely disturbed psychosexual development but lacks diagnostic significance. (French summary)—*Journal summary*.

3352. Stådeli, H. [Causes of the unfavorable development of severely disabled children.] (Germ) *Praxis der Kinderpsychologie und Kinderpsychiatrie*, 1974(Feb), Vol 23(2), 68-75.—Compares 2 groups of children: (a) 25 who were admitted to a Swiss child clinic in 1954-1969, and were later referred to a psychiatric clinic, and (b) 25 control children referred to an assessment ward during a 5-mo period. The following variables showed different frequencies in the 2 groups and are considered causes of problem development in the target children: (a) psychiatric problems in the parents; (b) the 1st yr of life spent with parents in severely disturbed circumstances, or involving changes in foster parents and/or home; (c) average intelligence, neither high nor low; and (d) diagnosis of character disorders. The implications of these findings for mental health programs are discussed.—*H. A. Euler*.

3353. Stein, Robert. *Incest and human love: The betrayal of the soul in psychotherapy*. Baltimore, MD: Penguin, 1974. xxi, 200 p. \$2.95.—Challenges Freud's central assumption that human development depends on the repression of the incestuous drives. A different attitude toward the incest taboo is proposed, the cultural significance of man's disturbed relationship with his instinctual roots, the effect of this relationship on aspects of masculine and feminine psychology, and the therapeutic role of transference are explored.

3354. Stephens, F. G. & Valentine, M. (Glenside Hosp, Bristol, England) **MMPI and clinical scales compared**. *British Journal of Psychiatry*, 1974(Jul), Vol 125, 42-43.—Administered the MMPI and M. Valentine's standardized psychiatric interview, the CAPRICE system (see PA, Vol 52:1087), to 70 psychiatric patients. Significant associations were found between (a) MMPI scales for Depression, Schizophrenia, and Manifest Anxiety (At) and (b) nearly the equivalent CAPRICE scales for Depression, Psychosis, and Anxiety. These relationships held regardless of whether or not the data included 10 MMPI records with doubtful validity (high F) scores. In these records, there were positive but nonsignificant associations for the same 3 scales. The MMPI scale for Psychasthenia (Pt) did not associate significantly with the CAPRICE scale of obsessional-compulsive disorder in any group.—*Journal summary*.

3355. Sue, Stanley & Sue, Derald W. (U Washington) **MMPI comparisons between Asian-American and non-Asian students utilizing a student health psychiatric clinic**. *Journal of Counseling Psychology*, 1974, Vol 21(5), 423-427.—The MMPI records of a total of 46 Chinese and Japanese students were compared with those of 120 non-Asian students from a university psychiatric clinic. Results indicate that compared to non-Asians, Chinese and Japanese students (a) underutilized the clinic services; (b) possessed more pronounced MMPI scale elevations; and (c) exhibited problems involving somatic

complaints, family discord, and social introversion. Findings are discussed within the context of Asian cultural values. It is suggested that rates of psychopathology have been underestimated for Asian-Americans.—*Journal abstract*.

3356. Sund, A. (U Oslo, Psychiatric Clinic, Norway) **Prognostic factors in the neurotic illness**. *Acta Psychiatrica Scandinavica*, 1974, Vol 50(1), 90-103.—103 young men in compulsory military service, diagnosed and treated for neurotic illness, were studied by using medical and social background data, follow-up, and personal reexamination to investigate prognostic factors in neurotic illness. Functional capacity was used as a criterion of neurotic disability, and 55% of the patients had no "functional failure" during the average observation period of 10.7 yrs. Factors having a positive prognostic significance included the absence of psychiatric disorders in the immediate family, a good emotional environment in childhood, neither very strict nor unstructured upbringing, ability for social adjustment during adolescence, a harmonious marriage during the observation period, and fitness for military service at follow-up. Mental capacity, high level of education, and high social class did not affect long-term prognosis. Explanations for these findings are offered.—*Journal abstract*.

3357. Teshima, Hideki; Inoue, Sadahisa; Ago, Yukihiko & Ikemi, Yujiro. (Kyushu U, Faculty of Medicine, Fukuoka City, Japan) **Plasminic activity and emotional stress**. *Psychotherapy & Psychosomatics*, 1974, Vol 23(1-6), 218-228.—From analysis of experimental and clinical data it is concluded that emotional stress accelerates plasminic activity through the autonomic nervous system and acts as the trigger in hereditary angioneurotic edema. Increased plasminic activity interferes with hormonal feedback. Plasmin, which acts on many substances, is activated easily by emotional stress, especially in allergic diseases.

3358. Udabe, Ronaldo U. **Biochemistry and psychiatry with special reference to psychopharmacology**. *Psychotherapy & Psychosomatics*, 1974, Vol 23(1-6), 179-187.—Suggests that the position of biochemistry with respect to the causes of mental illness may change drastically in the near future because of 3 discoveries, possibly of prime importance: the role of prostaglandins in controlling release and uptake of neurotransmitters, the role of cyclic adenosine-monophosphate (and its synthesizing enzyme, adenylyl cyclase) in neural transmission, and the role of certain neurohormones within the central nervous system.

3359. Vale, Salvador, et al. **Creatine phosphokinase**. *Archives of Neurology*, 1974(Jan), Vol 30(1), 103-104.—Obtained spinal fluid samples from 20 male and 20 female Ss 16-60 yrs old (mean age 27.6 yrs), 29 diagnosed as schizophrenics and the others as having affective or paranoid psychoses, with total duration of illness ranging from 1 mo to 26 yrs. Examination of the samples for creatine phosphokinase (CPK) revealed increased enzyme activity in 12 of the 40 Ss. CPK values ranged from 1 to 11 international units (IU)/100 ml, with a mean of 4 IU  $\pm$  3.5 standard deviations. Ss who showed increased spinal fluid activity were those in whom the psychotic state was in the acute phase.

Findings support the postulate that nonspecific brain damage frequently occurs in psychotic patients.—E. A. Gavin.

3360. van Keep, Pieter A. & Kellerhals, Jean M. (International Health Foundation, Geneva, Switzerland) **The impact of socio-cultural factors on symptom formation: Some results of a study on ageing women in Switzerland.** *Psychotherapy & Psychosomatics*, 1974, Vol 23(1-6), 251-263.—Demonstrates that biology and culture are not completely independent spheres, using data from a study involving interviews with 448 41-60 yr old Swiss women. It is shown that the impact of aging and of menopause as measured from 2 indices—climacteric complaints and subjective adaptation to daily life—was more severe in women of the lower social classes than in women of the higher social classes.

3361. Vartanian, M. Ye. & Gindilis, V. M. (USSR Academy of Medical Sciences, Inst of Psychiatry, Moscow) **Some notes on the genetics of behavior traits in man, especially of abnormal mental traits like schizophrenia.** *Social Biology*, 1973(Sep), Vol 20(3), 246-253.—Suggests that traditional explanations used in interpreting the results of twin studies be modified. In particular, the inheritance of schizophrenia is discussed in the light of proposed changes in analysis methodology.

3362. Vella, Gaspare & Bollea, Ernesto. (U Rome, Inst of Psychiatry, Italy) **[Early observations of depressed patients during interphasic periods.]** (Ital) *Rivista di Psichiatria*, 1973, Vol 8(5), 481-497.—Studied 20 patients suffering from monopolar endogenous depression, using a list of 147 psychopathological or behavioral factors to verify whether they recovered from the "phase," whether these depressive symptoms lasted, and whether other nondepressive symptoms existed. A group of abnormal Ss remained who showed symptoms of both depression and mania. It is considered impossible to obtain an exact diagnosis of their psychopathology from these interphasic periods.—*Journal summary.*

3363. Wallace, Charles J. & Davis, John R. (Camarillo—Neuropsychiatric Inst, CA) **Effects of information and reinforcement on the conversational behavior of chronic psychiatric patient dyads.** *Journal of Consulting & Clinical Psychology*, 1974(Oct), Vol 42(5), 656-662.—Conducted 2 experiments to determine if the conversational behavior of 3 male and 1 female chronic psychiatric patients could be increased through either reinforcement or the provision of information about potential topics of conversation. Each experiment utilized 1 dyad in a withdrawal design or a combined changing criterion and withdrawal design. For 3 of the 4 Ss a positive reinforcement contingency was used, while for the 4th an avoidance contingency was used. Conversation was defined as talk between the members about a specified topic of general interest with eye contact at least once every 15 sec. Only reinforcement increased conversational behavior. Information about the specified topics was ineffective in spite of the fact that the information was comprehended and was relevant to the topics. Additional results demonstrate the ineffectiveness of instructions and the potential usefulness of the infrequently used changing criterion design. The avoidance of extended conversation effectively reinforced a

specified duration of initial conversation. (18 ref) —*Journal abstract.*

3364. Ward, Patricia & Rouzer, David L. (Georgia State U) **The nature of pathological functioning from a Gestalt perspective.** *Counseling Psychologist*, 1974, Vol 4(4), 24-27.—Discusses the Gestalt view of healthy and unhealthy personalities. A healthy person accepts the necessity and inevitability of change. For the pathological person, there is discrepancy between how he sees himself and what he feels he should be. The neurotic is not at peace with his inner self-concept. He cannot love and blames this on the world around him. Unconsciously he surrounds himself with people who reinforce his view of reality; this is less painful than relating to a loving person. The narcissist gives himself the love which he feels he cannot get from others.—H. Silverman.

3365. Waring, E. M. (Clarke Inst of Psychiatry, Toronto, Ontario, Canada) **Emotional illness in psychiatric trainees.** *British Journal of Psychiatry*, 1974(Jul), Vol 125, 10-11.—Administered the General Health Questionnaire to 83 psychiatric postgraduate trainees. 22% of the trainees had scores in the range of a probable case of nonpsychotic emotional illness as compared with 3% of a control group of 46 nonpsychiatric medical postgraduate trainees. No differences were found between 1st-yr trainees, foreign medical graduates, or British-born and trained Ss.

3366. Weissman, Myrna M. & Paykel, Eugene S. (Yale U) **The depressed woman: A study of social relationships.** Chicago, IL: U Chicago Press, 1974. xix, 289 p. \$10.—Reports a 20-mo study of the social functioning, adjustment, and behavior patterns of 40 depressed women and a matched control group of 40 normal women. Results include methodological issues in studying social adjustment, whether social impairments in depressed women are the result of a depressive episode or whether they reflect personality characteristics which precipitate depression, and the relative effectiveness of 3 treatment philosophies (pharmacotherapy, psychotherapy, or both). (14 p ref)

3367. Wing, J. K.; Cooper, J. E. & Sartorius, N. (MRC Social Psychiatry Unit, Inst of Psychiatry, London, England) **Measurement and classification of psychiatric symptoms: An instruction manual for the PSE and Catego program.** Cambridge, England: Cambridge U Press, 1974. x, 233 p. \$14.50.—Presents a guide to a method of partially standardizing the assessment of a subject's mental state in order to achieve greater comparability between different examiners. The Present State Examination interview technique, which allows symptoms to be elicited and accurately recorded, is detailed. (3 p ref)

3368. Winokur, George; Morrison, James; Clancy, John & Crowe, Raymond. (U Iowa, Medical School) **Iowa 500: The clinical and genetic distinction of hebephrenic and paranoid schizophrenia.** *Journal of Nervous & Mental Disease*, 1974(Jul), Vol 159(1), 12-19.—Studied 115 consecutively admitted hebephrenics and 62 paranoid schizophrenics, using hospital records, interview transcripts, and clinical observation and assessment. Clinically the 2 groups differed in that the hebephrenics had more changes in affect, more tangential thinking, blocked more, and were more delusional. Hallucinations

were equal between both groups. Paranoids were admitted at an older age, were older at the age of onset, and showed less disruption of family life. A blind family history assessment revealed that hebephrenic probands had over 3 times as many schizophrenic relatives as the paranoid probands. These familial data indicate a high probability that process schizophrenia is not a unitary (homogeneous) illness. It is suggested that there are 2 types of schizophrenia, one of which may manifest itself mostly as hebephrenia but occasionally as paranoid schizophrenia. The 2nd type would be paranoid schizophrenia in which there is a paucity of schizophrenic relatives. In paranoid schizophrenia, an affected relative, should he exist, would have only paranoid schizophrenia. Thus, there may be only 1 type of hebephrenic schizophrenia but 2 types of paranoid schizophrenia, one related genetically or familiarly to hebephrenic schizophrenia.—*Journal abstract.*

3369. Wittkower, E. D. & Warnes, H. (McGill U, Montreal, Quebec, Canada) **Transcultural psychosomatics.** *Psychotherapy & Psychosomatics*, 1974, Vol 23(1-6), 1-12.—Surveys the current body of knowledge regarding the cultural etiological parameter of psychosomatic disease, citing investigative difficulties, objectives, and methodologies. Data are discussed concerning the prevalence of cardiovascular and gastrointestinal disorders and the influence of race, life expectancy, eating habits and diet, psychosocial stress, and basic personality on psychosomatic diseases. (37 ref)

3370. Wolkind, S. N. (London Hosp Medical Coll, England) **Sex differences in the aetiology of antisocial disorders in children in long term residential care.** *British Journal of Psychiatry*, 1974(Aug), Vol 125, 125-130.—Studied 53 male and 39 female 5-12 yr old institution residents to determine whether same or different factors are related to the development of antisocial disorders in males and females, and whether factors related to antisocial traits are the same for children living outside institutions as for inmates. Results show that 40% of the males and 26% of the females had an antisocial or antisocial-neurotic disorder. Different factors were associated with this disorder in each sex: for the males, lack of father-contact and large numbers of siblings; for the females, prolonged early experience of residential care. Implications of the findings for child psychiatric care are discussed. (20 ref)—*Journal summary.*

3371. World Health Organization. (Geneva, Switzerland) **The international pilot study of schizophrenia.** Geneva, Switzerland: World Health Organization, 1974. xi, 427 p.—Presents the results of the initial evaluation phase of the World Health Organization's international study of schizophrenia. Among the topics included are the distribution, diagnosis, management, and operation of schizophrenia; description of field research centers; characteristics and psychopathological description of the study population; and applicability and reliability of methods and classification by cluster analysis. (14 p ref)

3372. Wortis, Joseph; Sersen, Eugene A.; Floistad, Iver & Astrup, Christian. (State U New York, Stony Brook) **Childhood and adult schizophrenia: Some clinical and experimental comparisons.** *Pavlovian Journal of Biological Science*, 1974(Jul-Sep), Vol 9(3),

149-159.—Studied 31 childhood schizophrenics, using a battery of motor conditional reflex tests, an autonomic conditioning test, and a word association test. Presenting symptoms were not comparable to those seen in a group of adult schizophrenics tested with similar procedures. It is noted that the literature fails to provide convincing evidence that childhood schizophrenia starting before age 11 represents the same clinical symptomatology, genetic background, and course of illness, as adult schizophrenia. Childhood schizophrenia seldom appears to involve long-term schizophrenic deterioration. (23 ref)—*Journal abstract.*

### Behavior Disorders

3373. Bollea, Ernesto & Gaston, Alberto. (U Rome, Inst of Psychiatry, Italy) [The concept of "alcoholic epilepsy": Considerations based on a clinical case.] (Ital) *Rivista di Psichiatria*, 1973, Vol 8(5), 583-597.—Discusses the case of a 41-yr-old male in the light of the most recent biochemical and EEG research. A distinction is made between "regular convulsive crises," characterized by actual organic damage, and "accidental convulsive crises," where the alteration is essentially functional. It is concluded that the regular convulsive crises of chronic alcoholics are bound to several etiopathogenic factors: toxic effect of alcohol on the nerve cells, electrolytic imbalance, lack of polyvitamins B, and status of cerebral hypoxia. All of these factors can potentially bring about convulsive phenomena, but the convulsive seizure is usually caused by a combined action of some of them only. (58 ref)—*Journal summary.*

3374. Buglass, Dorothy & Horton, John. (MRC Unit for Epidemiological Studies in Psychiatry, Edinburgh, Scotland) **The repetition of parasuicide: A comparison of three cohorts.** *British Journal of Psychiatry*, 1974(Aug), Vol 125, 168-174.—Surveyed 3 successive annual cohorts ( $N = 2,809$ ) to determine the factors which are consistently related to the repetition of suicidal behavior. Findings identified the following items that consistently discriminated repeaters: sociopathy, problems in the use of alcohol, previous inpatient or outpatient psychiatric treatment, previous parasuicide, low social class, dependence on drugs, unemployment, and a history of criminal behavior. There was a considerable degree of similarity between male and female repeaters, the proportion of repeaters under 25 yrs increased between 1968 and 1970, and there was no evidence that inpatient care prevented subsequent repetition. (16 ref)—*Journal summary.*

3375. Chappell, Duncan; Geis, Gilbert & Fogarty, Faith. (Battelle Memorial Inst, Law & Justice Study Ctr, Seattle, WA) **Forcible rape: Bibliography.** *Journal of Criminal Law & Criminology*, 1974(Jun), Vol 65(2), 248-263.—Demonstrates a large change of emphasis between pre-1969 and post-1969 materials. Earlier cases deal mainly with aspects of protecting an accused rapist from vindictive charges, while the more recent literature stresses the protection of the rape victim. The earliest citation found was published in 1940; the latest in 1973. References are organized into the following main categories (followed by subheadings): Sociology, The Victim, The Offender, The Law, Medical and Medico-

Legal, Police Investigation, and Rape in Non-Common Law Jurisdictions. No summaries are included.

3376. Chesney-Lind, Meda. (U Hawaii) **Juvenile delinquency: The sexualization of female crime.** *Psychology Today*, 1974(Jul), Vol 8(2), 43-46.—Contends that juvenile courts treat girls more harshly than boys. A far larger proportion of girls are arrested and institutionalized for juvenile (as opposed to penal) offenses than boys. Girls are often suspected of sexual promiscuity regardless of the actual charge. Thus, in the name of protection, the civil rights of girls are systematically violated.

3377. D'Orbán, P. T. (H. M. Prison, Medical Officer, London, England) **A follow-up study of female narcotic addicts: Variables related to outcome.** *British Journal of Psychiatry*, 1974(Jul), Vol 125, 28-33.—66 female narcotic addicts first examined in 1967-1968 were followed up 4 yrs later by reference to drug, criminal, and death record data. 36% had become abstinent, 32% had remained addicted, and 15% had died. Comparisons were made on 8 variables between those with good and those with poor outcomes. Outcome was assessed in terms of continued addiction, delinquency, and addiction status. The number of previous convictions showed a significant inverse relationship to abstinence; this association may be worth validating in prospective studies of both sexes. (20 ref)—*Journal summary*.

3378. De Sousa, Alan. (Grant Medical Coll, Bombay, India) **Causes of behaviour problems in children.** *Child Psychiatry Quarterly*, 1974(Jan), Vol 7(1), 3-8.—Reviews the environmental factors in child development beginning with conception. During the prenatal period, the fetus reacts to the mother's anxiety state, nutritional status, and physical health. The process of birth is described as a trauma in which abnormal birth takes an even greater toll on the infant. During early upbringing the attitudes and behavior of the mother or mother surrogate form the basis of the infant's concept of the outside world. All faulty parental attitudes can be considered to lie along the cross-axes of overprotection and rejection. The effects of the joint family, cultural factors, the neighborhood, and the media (e.g., television) on the child are cited.—*R. S. Albin*.

3379. Dorpat, Theodore L. (Blakely Psychiatric Group, Seattle, WA) **Drug automatism, barbiturate poisoning, and suicide behavior.** *Archives of General Psychiatry*, 1974(Aug), Vol 31(2), 216-220.—Discusses the differential diagnosis of accidental vs intentional barbiturate poisoning. Studies of a nonfatal and a fatal case of barbiturate poisoning show that, although cases of accidental barbiturate poisoning do occur, they are not caused by drug automatism. The apparent lack of self-destructive intentionality and the amnesia for the overdose in nonfatal cases, erroneously diagnosed as drug automatism, are explained by the patients' needs to deny their self-destructiveness and to repress their memory of the overdose. The literature contains no well-authenticated cases of fatal barbiturate poisoning caused by drug automatism. The persistence of the drug automatism hypothesis is partially explained by the tendency of many patients, their relatives, and physicians to deny the self-destructive motives and actions of the patient. (23 ref)—*Journal abstract*.

3380. Earles, James A.; Mullins, Cecil J. & Vitola, Bart M. **Variables related to amphetamine use.** *US AFHRL Technical Report*, 1974(Mar), No 74-22, 22 p.—Compared a sample of 985 self-admitted amphetamine users with a sample of 9,378 airmen who had no known record of drug abuse. Results indicate a strong likelihood that amphetamine users also abuse other drugs. There were relationships between amphetamine use and geographic area of enlistment, religious preference, aptitude scores, educational level, and age at enlistment. Amphetamine use was also related to the likelihood of getting an undesirable discharge and to lower Airman Proficiency Report ratings.—*Journal abstract*.

3381. File, Karen N.; McCahill, Thomas W. & Savitz, Leonard D. (Treatment Alternatives to Street Crime, Philadelphia, PA) **Narcotics involvement and female criminality.** *Addictive Diseases: An International Journal*, 1974, Vol 1(2), 177-188.—Studied the relationship between drug abuse and criminal records in 7,883 arrests made in a 90-day period in Philadelphia, 1,087 (13.8%) of which involved females and 227 (20.9%) of which were classified as narcotics related. Specific data from these 227 arrests on the relationship between drug abuse and prostitution and comparisons between nonprostitute and prostitute arrestees are presented. Data suggest that criminal patterns among female addicts can be classified in 4 groups: prostitute/criminals (i.e., prostitutes with histories of serious crimes), prostitutes (i.e., prostitutes with no histories of serious crimes), criminals (i.e., females who have never been arrested for prostitution but have been arrested for other serious offenses), and "bag-followers" (i.e., female addicts who carry drugs for pushers but have no records of prostitution or other serious crimes). It is suggested that these groups present identifiable alternative hustling patterns rather than stages in a general socialization pattern involving narcotics addiction and crime.—*L. Gorsey*.

3382. Gibbons, Robert J. et al (Ed.). (Addiction Research Foundation, Toronto, Ontario, Canada) **Research advances in alcohol and drug problems: I.** New York, NY: John Wiley & Sons, 1974. xvii, 428 p.

3383. Goodwin, Donald W. et al. (Washington U, Medical School) **Drinking problems in adopted and nonadopted sons of alcoholics.** *Archives of General Psychiatry*, 1974(Aug), Vol 31(2), 164-169.—Compared 20 sons of alcoholic parentage, adopted in infancy, with their 30 brothers who were raised by the alcoholic parent. Both the adopted and nonadopted sons had high rates of alcoholism (25% and 17%, respectively), but the difference was not statistically significant. The 2 groups also had comparable frequency of alcohol problems. The nonadopted sons differed from the adopted sons in age (older) and belonged to a lower socioeconomic class. Length of exposure to the alcoholic parent was not associated with the development of alcoholism. However, severity of the parent's alcoholism, as inferred by number of hospitalizations, was positively related to alcoholism in the offspring. Results suggest that environmental factors contributed little, if anything, to the development of alcoholism in sons of severe alcoholics, in this sample. (16 ref)—*Journal abstract*.

3384. Griffiths, Roland; Bigelow, George & Liebson, Ira. (Johns Hopkins U, Medical School) **Assessment of**

effects of ethanol self-administration on social interactions in alcoholics. *Psychopharmacologia*, 1974, Vol 38(2), 105-110.—5 39-49 yr old male chronic alcoholic volunteers participated in an experiment in which the availability or nonavailability of a daily ration of 12 oz (360 ml) of 95-proof ethanol (133.68 g) was randomly determined. For all Ss, rates of social interaction were significantly higher on ethanol days than nonethanol days. The study demonstrates the feasibility of using complex molar units of human behavior as dependent variables in behavioral pharmacology research. (16 ref)—*Journal abstract*.

3385. Hafner, James L. & Linkenhoker, Dan. (Indiana State U) **Quantifying the reinforcement value of verbal items on drug addicts that were inmates of a prison.** *Journal of the Association for the Study of Perception*, 1974(Spr), Vol 9(1), 17-25.—Scaled 20 words according to their reinforcing value. 47 undergraduates and 53 prisoners in a drug treatment program rated the words according to whether or not they would like to have a respected person say the word after S performed a task. A frequency table was compiled that indicated the number of times each word was chosen. Items in the frequency table with a high numerical value were denoted as liked and positive; items with a low numerical value were denoted as disliked and negative. One of each positive, negative, and neutral reinforcers was used in a verbal conditioning experiment with 84 additional male prisoners. After "I-we" sentences, Ss were given orally 1 of the 3 reinforcing words. The positive reinforcer produced a progressive increase in the rate of responding; the negative reinforcer produced a nonsignificant, but apparently decreasing reinforcing characteristic; the neutral reinforcer produced no significant change in the rate of responding. (15 ref)—*Journal summary*.

3386. Hardy, Richard E. & Cull, John G. (Virginia Commonwealth U) **Vocational satisfaction among alcoholics.** In J. G. Cull & R. E. Hardy (Eds), *Alcohol abuse and rehabilitation approaches*. Springfield, IL: Charles C Thomas, 1974. xiii, 203 p. \$12.75.—Studied 72 nonalcoholic and 93 alcoholic vocational rehabilitation clients to determine the differences between the expressed vocational interest of alcoholics and their actual occupations prior to admission to a treatment center. Results indicate that both groups showed the greatest preference for social service occupations and that alcoholic Ss held significantly fewer such jobs.

3387. Holzer, Dietrich. **[Correct and incorrect diagnoses in psychological and psychiatric reports about maladapted juveniles.]** (Germ) *Praxis der Kinderpsychologie und Kinderpsychiatrie*, 1974(Feb), Vol 23(2), 50-56.—Examines psychological and/or psychiatric reports concerning 108 poorly socialized adolescents. 14 of the cases illustrate the overestimation of sociogenic and psychogenic factors and the neglect of inborn characterological traits.

3388. Jabara, Raymond F. & Curran, Stephen F. (VA Drug Treatment Unit, Baltimore, MD) **Comparison of the Minnesota Multiphasic Personality Inventory and Mini-Mult with drug users.** *Journal of Consulting & Clinical Psychology*, 1974(Oct), Vol 42(5), 739-740.—Data from 60 male drug addicts and users support

previous findings that when correlations between corresponding MMPI and Mini-Mult scales are used, there is good correspondence; however, there is low accuracy with respect to clinical evaluation and high-point correspondence.

3389. Kiev, Ari. (New York Hosp—Cornell Medical Ctr, NY) **Prognostic factors in attempted suicide.** *American Journal of Psychiatry*, 1974(Sep), Vol 131(9), 987-990.—Analyzes clinical and social data collected from 300 patients at the time of a suicide attempt and again 1 year after the attempt for 299 of the patients. Results of the follow-up showed prognostic significance for 3 factors: interpersonal conflict, symptom distress, and the social setting of the suicide attempt. The significance of these factors in predicting further suicide attempts calls attention to the need for psychiatrists to take cognizance of the social world of the patient following a suicide attempt.—*Journal abstract*.

3390. Klatch, Dolores. **Woman plus woman: Attitudes toward lesbianism.** New York, NY: Simon & Schuster, 1974. 287 p. \$8.95.—Explores the hypocrisy, misinformation, and contradictory theories surrounding the subject of lesbianism, and discusses the lives and times of some of the more articulate and historical lesbian figures. Data from frank interviews and anonymous questionnaires are included. (8 p ref)

3391. Kuhn, Roland. (Psychiatric Clinic, Münster, W Germany) **[The current importance of the work of Ludwig Binswanger.]** (Germ) *Zeitschrift für Klinische Psychologie und Psychotherapie*, 1972, Vol 20(4), 311-321.—Presents a discussion of L. Binswanger and his theories. The case of a young drug abuser suffering from periodic endogenous depression and psychosomatic stomach disorders is presented as an illustration of Binswanger's approach to the biological and psychological aspects of psychoses induced by drug addiction and their treatment. (English summary)

3392. Leibach, Werner K. (U Clinics of Bonn, W Germany) **Organic pathology related to volume and pattern of alcohol use.** In R. J. Gibbons et al (Eds), *Research advances in alcohol and drug problems: I*. New York, NY: John Wiley & Sons, 1974. xvii, 428 p.—Reviews data on physiological and pathological factors in alcoholism, including comparative studies of consumption and drinking patterns in various countries, capacity of ethanol elimination, the quantitative effects of alcohol intake, the effects of abstinence, genetic predisposition and susceptibility, and the effects of various types of alcoholic beverages. (540 ref)

3393. Levine, David G.; Preston, Phyllis A. & Lipscomb, Sally G. (San Francisco Methadone Treatment Program, CA) **A historical approach to understanding drug abuse among nurses.** *American Journal of Psychiatry*, 1974(Sep), Vol 131(9), 1036-1037.—Investigation of the histories of 12 nurses who abused drugs disclosed an early and extensive involvement in medical treatment. A "medical dependence" became evident, manifested by somatic orientation, chronic medical difficulties, dependence on alcohol, and, finally, dependence on other drugs. It is considered that irrational attitudes toward addicting substances underlie this progression. This developmental theme is significant in

the genesis of addiction among nurses and should be dealt with during rehabilitation.—*Journal abstract.*

3394. Mayfield, Demmie; McLeod, Gail & Hall, Patricia. (VA Hosp, Providence, RI) **The CAGE questionnaire: Validation of a new alcoholism screening instrument.** *American Journal of Psychiatry*, 1974(Oct), Vol 131(10), 1121-1123.—Administered the CAGE questionnaire, a new brief alcoholism screening test, to all patients ( $N = 366$ ; 39% alcoholic) admitted to a psychiatric service over a 1-yr period. Results indicate that the CAGE questionnaire is not a sensitive alcoholism detector if a 4-item positive response is the criterion; however, if a 2- or 3-item criterion is used, it becomes a viable rapid alcoholism screening technique for large groups.—*Journal abstract.*

3395. Mercer, G. W. & Smart, R. G. (York U, Toronto, Ontario, Canada) **The epidemiology of psychoactive and hallucinogenic drug use.** In R. J. Gibbons et al (Eds), *Research advances in alcohol and drug problems: I*. New York, NY: John Wiley & Sons, 1974. xvii, 428 p.—Reviews data on psychoactive and hallucinogenic drug use patterns in the US, Canada, Asia, Africa, South America, Australia, and Europe. General methodological difficulties in epidemiological drug studies are discussed, and an overview of morbidity and mortality associated with drug use is presented. (294 ref)

3396. Mier y Terán, Carmen; Schnass, Lourdes; Vargas, Guaria & Belsasso, Guido. (Ctr Mexicano de Estudios en Farmacodependencia, Mexico City) **Drug abuse among the inmates of a women's prison in Mexico City.** *Addictive Diseases: An International Journal*, 1974, Vol 1(2), 153-175.—Interviewed 24 Mexican female narcotics addicts about their family backgrounds, drug abuse histories, and socioeconomic status. 2 control groups were also interviewed, one consisting of nonaddict prison inmates and the other of nonprison women with similar socioeconomic backgrounds. Specific data are presented for age at first use of various drugs, educational backgrounds, social and geographic mobility of the addicts and their families, and occupational status. Results suggest that (a) a relationship existed among drug abuse, tobacco use, and alcoholism, with addicts using these substances at earlier ages than the 2 control groups; (b) drug abuse usually began in adolescence; and (c) inadequate socialization and family instability were major characteristics of the addict group. It is concluded that deviant behavior (e.g., drug abuse) emerges from varied socioeconomic contexts which make adequate socialization difficult, and that if certain factors do exist (e.g., those which contribute to the stability of heterosexual relationships), the appearance of symptomatology related to family conflict and inadequate socialization will be retarded. (21 ref)—*L. Gorsey.*

3397. Mormont, C. (U Liège, Psychiatric Clinic, Belgium) **[Study of the Rorschach test in the case of a girl who tried to commit suicide.]** (Fren) *Acta Psychiatrica Belgica*, 1973(May), Vol 73(3), 387-392.—Describes the case of 10-yr-old girl whose suicidal ideation was reflected in her Rorschach record.

3398. Murphy, John; Bennett, Robert; Hagen, James M. & Martin, Chris. (VA Hosp, Salem, VA) **The relationship of physical fitness to mental adjustment: III. The effects of reconditioning upon the vital capacity**

**of known alcoholics.** *American Corrective Therapy Journal*, 1972(Sep), Vol 26(5), 142-144.—Reviews the literature on the relationship between vital capacity, physical activity, and coronary heart disease among alcoholics. A study is described to test the hypothesis that a 3-mo course in physical reconditioning would make a significant difference in the predicted vital capacity for a group of 76 alcoholics. Results show no gains in vital capacity among participants. Vital capacity is considered to be a significant indicator of physical fitness despite the lack of statistical substantiation.—*R. S. Albin.*

3399. Nelles-Bächler, Maria. (Rheinland Pedagogical Coll, Cologne, W Germany) **[The disadvantages of aggressive children at school.]** (Germ) *Praxis der Kinderpsychologie und Kinderpsychiatrie*, 1974(Apr), Vol 23(3), 99-102.—Presents the case of an aggressive 15-yr-old boy with poor scholastic achievement despite good intellectual capacities. This underachievement is explained by social-psychological factors. Proposals are offered for training programs for such disadvantaged children.

3400. Newman, Robert C. & Pollack, Donald. (San Bernardino County, Mental Health Services, CA) **Newman and Pollack reply.** *Journal of Consulting & Clinical Psychology*, 1974(Oct), Vol 42(5), 749-750.—Replies to B. Wolfe's (see PA, Vol 53:Issue 2) criticisms of the author's statistical design and methods of analysis. Further clarifications of the procedures are presented, and some post hoc suggestions for clearer interpretations of the results are offered.

3401. Nisbett, Richard E. & Storms, Michael D. (U Michigan) **Cognitive and social determinants of food intake.** In H. London & R. E. Nisbett (Eds), *Thought and feeling: Cognitive alteration of feeling states*. Chicago, IL: Aldine, 1974. 239 p. \$8.95.—Reports 3 experiments to test the hypothesis that food intake of overweight individuals is more affected by external cues of a cognitive or social nature than the intake of normal-weight persons. Data indicate that food intake of people in general was affected by cognitive and social cues, but overweight persons were not more responsive to these cues than other persons. (17 ref)

3402. Nowicki, Stephen & Hopper, Allen E. (Emory U, Psychological Ctr) **Locus of control correlates in an alcoholic population.** *Journal of Consulting & Clinical Psychology*, 1974(Oct), Vol 42(5), 735.—Data from male and female alcoholic in- and outpatients who completed a locus of control measure by Nowicki and Strickland, a figure-copying test, and a short form of the WAIS show that (a) female inpatients had significantly more external scores and (b) external orientation was related to a greater evidence of psychomotor impairment in females and to generally lower verbal IQ scores for both sexes.

3403. Nyström, Sune A. (U Göteborg, Sweden) **An overview of research in alcohol abuse.** In J. G. Cull & R. E. Hardy (Eds), *Alcohol abuse and rehabilitation approaches*. Springfield, IL: Charles C Thomas, 1974. xiii, 203 p. \$12.75.—Reviews research in alcohol abuse relating to background factors of the disease, natural development of symptoms, and aspects of prevention. (52 ref)

3404. **Payne, Clive; McCabe, Sarah & Walker, Nigel.** (Nuffield Coll, Research Services Unit, Oxford, England) **Predicting offender-patients' reconvictions.** *British Journal of Psychiatry*, 1974(Jul), Vol 125, 60-64. —Describes a simple additive prediction model based on a logistic analysis of N. D. Walker and S. F. McCabe's 1973 study of 334 psychiatric offender patients who were allowed to leave within a year of admission. As with ordinary criminal samples, the number of previous convictions and type of current offense were powerful predictors of reconviction, although sex and age had negligible predictive powers, contrasting sharply with ordinary penal groups. Diagnosis was a useful predictor only if those patients who were readmitted without being reconvicted are included. Data confirm the importance of after-care programs, especially for high-risk groups. —*Journal summary.*

3405. **Phillipson, Richard.** (National Inst of Drug Abuse, Washington, DC) **Adolescent alcohol abuse.** *Drug Abuse and Alcoholism Newsletter*, 1973(Nov), Vol 2(8), 4 p. —Discusses data that suggest an increase in the prevalence of adolescent alcohol abuse, implications of lowering the drinking age, and measures and alternatives that might be developed to prevent further abuse. The importance of the peer group in adolescent drinking is noted, and a question-and-answer section on the problem is included.

3406. **Raymaker, Henry.** (VA Ctr, Dublin, GA) **Prediction of delinquent behavior.** In R. E. Hardy & J. G. Cull (Eds), *Therapeutic needs of the family: Problems, descriptions and therapeutic approaches*. Springfield, IL: Charles C Thomas, 1974. xv, 240 p. —Describes several signs of potential delinquency and discusses the need for psychological evaluation of young people to prevent or treat problem behaviors. The use of projective techniques with delinquents and recurrent themes in adolescent stories are examined and related to the need to evaluate the patient's self-concept. Community responsibility for the problem of juvenile delinquency is also assessed.

3407. **Robinson, Malcolm G. et al.** (Walter Reed Army Inst of Research, Washington, DC) **Assessment of pupil size during acute heroin withdrawal in Viet Nam.** *Neurology*, 1974(Aug), Vol 24(8), 729-732. —Cites the use of large amounts of pure heroin by many soldiers during the Viet Nam conflict. Photographic pupillometry was used to evaluate 10 such heroin users and 5 controls 3 times/day for 6 days after the patients' last heroin dose. Initially, heroin users had constricted pupils that dilated as withdrawal progressed and remained mydriatic thereafter. Stimulation with intense light further constricted the miotic pupils of heroin-intoxicated patients. Pupil diameter exhibited a definite circadian pattern, with increasing size throughout each day both in patients and controls. Results confirm pupil diameter as an excellent differential indicator of heroin intoxication and withdrawal. (16 ref) —*Journal abstract.*

3408. **Roebuck, Julian B.** (Mississippi State U) **The psychological approach to the understanding of alcoholism.** In J. G. Cull & R. E. Hardy (Eds), *Alcohol abuse and rehabilitation approaches*. Springfield, IL: Charles C Thomas, 1974. xiii, 203 p. \$12.75. —Discusses psychological theories of the etiology of alcoholism which emphasize alcohol effects, reinforcement, transactional analysis

concepts, psychoanalytic concepts, field dependence, and the alcoholic personality. A review of evidence supporting each theory indicates that the alcoholic is a passive-dependent person who uses alcohol as an escape. (11 p ref)

3409. **Saunders, Jacquelyn R.; Vitola, Bart M. & Mullins, Cecil J.** **Correlates of barbiturate use.** *US AFHRL Technical Report*, 1974(Mar), No 74-21, 22 p. —Compared a sample of 448 self-admitted preservice barbiturate users with a control sample of 9,378 airmen with no known record of drug abuse. The barbiturate sample differed significantly from the control sample in that barbiturate users (a) were disproportionately represented in the North-Northeast and Far West-Pacific Coast enlistment areas, (b) more often indicated no religious preference, and (c) enlisted at a younger age. Degree of barbiturate use was negatively associated with aptitude, educational level, and measures of success in the US Air Force, and was positively associated with the use of other drugs. —*Journal abstract.*

3410. **Schneck, Jerome M.** (St Vincent's Hosp & Medical Ctr of New York, NY) **Zooerasty and incest fantasy.** *International Journal of Clinical & Experimental Hypnosis*, 1974(Oct), Vol 22(4), 299-302. —Reports specific clinical data on zooerasty revealed in psychotherapy with an intelligent 45-yr-old man. Incorporation of zooerasty into an incest theme is of additional interest. The manner in which the patient dealt with this material in treatment is described. (German, French, & Spanish summaries) —*Journal abstract.*

3411. **Schuster, Charles R. & Johanson, Chris E.** (U Chicago) **The use of animal models for the study of drug abuse.** In R. J. Gibbons et al (Eds), *Research advances in alcohol and drug problems: I*. New York, NY: John Wiley & Sons, 1974. xvii, 428 p. —Outlines a conceptual conditioning/reinforcement framework for an animal model of drug abuse based on 4 distinct problems: physical dependence, behavioral or psychological dependence, physiological and behavioral consequences of drug use, and self-administration of a drug for nonmedical purposes. Methodologies for studies of these problems with animals and pharmacological and environmental variables affecting drug self-administration are discussed. (75 ref)

3412. **Steffen, John J.; Nathan, Peter E. & Taylor, H. Augustus.** (U Cincinnati) **Tension-reducing effects of alcohol: Further evidence and some methodological considerations.** *Journal of Abnormal Psychology*, 1974(Oct), Vol 83(5), 542-547. —Studied the relations among alcohol consumption, self-reported distress, and muscular tension in 4 male 28-45 yr old male chronic alcoholics. Ss were permitted free access to beverage alcohol and were monitored for blood alcohol level, electromyographic response, and subjective distress every other hour of their waking day for 12 days. Pearson product-moment correlations revealed (a) significant negative correlations between blood alcohol level and electromyographic response, (b) a significant positive correlation between blood alcohol level and subjective distress, and (c) no relation between electromyographic response and subjective distress. Results, while supporting a tension-reduction model of the effects of alcohol, reveal a complex interaction between alcohol

consumption, subjective distress, and muscular tension.—*Journal abstract.*

3413. **Stoller, Robert J.** (U California, Medical School, Los Angeles) **The male transsexual as "experiment."** *International Journal of Psycho-Analysis*, 1973, Vol 54(2), 215-225.—Discusses the early factors in the development of male transsexualism, focusing on studies and theories of early stages of infantile development in both normal and perverse people. The adult male transsexual is seen as having been feminine since earliest childhood. By age 3 or 4 he is already saying he wants to be a girl. As an adolescent, this person has already successfully passed as a woman. The etiology of this pattern in the early mother-child relationship is noted. Core gender identity and its relation to perversion is discussed. The relationship of fetishism to transsexualism is also considered. (32 ref)—*R. S. Albin.*

3414. **Strassberg, Donald S. & Robinson, Janice S.** (Ohio State U) **Relationship between locus of control and other personality measures in drug users.** *Journal of Consulting & Clinical Psychology*, 1974(Oct), Vol 42(5), 744-745.—Data from 60 self-identified heroin users who completed a battery of personality tests show that previous findings relating locus of control to adjustment and self-concept among nondrug users are valid for narcotics users as well, and that locus of control in drug users is not a function of the length of drug use or age of the user.

3415. **Tyndel, Milo.** (Addiction Research Foundation, Toronto, Ontario, Canada) **Psychiatric study of one thousand alcoholic patients.** *Canadian Psychiatric Association Journal*, 1974(Feb), Vol 19(1), 21-24.—Describes a 2-yr study of 1,017 hospitalized alcoholics. All were diagnosed as either neurotic (58%), psychotic (6%), or personality disorder (36%). It is concluded therefore that there can be no such thing as "primary alcoholism" and that the development of alcoholism is inconceivable without underlying psychopathology.

3416. **Vista Hill Psychiatric Foundation.** (San Diego, CA) **The drug dependent paraplegic.** *Drug Abuse and Alcoholism Newsletter*, 1974(Jan), Vol 2(9), 4 p.—Discusses the problem of the drug dependent paraplegic, emphasizing that drug abuse among such patients may be caused both by iatrogenic and psychological factors. 8 major reasons why paraplegics, particularly young persons, may abuse psychoactive drugs are presented, and special considerations in the treatment and prevention of this problem are described. Treatment of the paraplegic addict does not differ significantly from the treatment of other addicts, although differences between street and paraplegic addicts do exist in terms of drug availability and reasons for use. The possibility that drug and/or alcohol dependency may predate the paraplegic condition is also noted.—*L. Gorsey.*

3417. **Wagner, Gerhard.** (Berlin-Lichtenberg Neurological & Psychiatric Hosp, E Germany) **[On the motivation of incendiarism.]** (Germ) *Psychiatrie, Neurologie und medizinische Psychologie*, 1974(Mar), Vol 26(3), 155-164.—Challenges the conventional assumption that sexual perversion is the motive for arson. Case histories reveal the basic motivation as a chronic social frustration, with or without a personal need for attention. Literature is cited which supports the conventional view,

and the opposing view that incendiarism is a spontaneous reaction to reduce anxiety. (56 ref)

3418. **Westermeyer, Joseph.** (U Minnesota Hosp, Minneapolis) **Opium dens: A social resource for addicts in Laos.** *Archives of General Psychiatry*, 1974(Aug), Vol 31(2), 237-240.—Studied the social functions of opium dens in Laos by 2 methods. Repeated visits were made to 3 opium dens. Data were collected on the physical structure of the den, the owner-proprietor, the customer-participants, the activities, and conversations in the dens. 35 addicts were selected to comprise a representative sample and were interviewed regarding their present locus of opium usage; demographic data were obtained from these addicts. Data on several psychosocial functions that dens serve for certain opium users are presented. The dens seem to serve urban society by providing a milieu within which certain people can meet needs that were served formerly in village society, but which are neglected in urban settings. (15 ref)—*Journal abstract.*

3419. **Williams, Allan F.** (Insurance Inst for Highway Safety, Washington, DC) **Causes of alcohol abuse.** In J. G. Cull & R. E. Hardy (Eds), *Alcohol abuse and rehabilitation approaches*. Springfield, IL: Charles C Thomas, 1974. xiii, 203 p. \$12.75.—Reviews the literature on the possible causes of alcohol abuse, including hereditary, physiological, sociological, and personality factors. Suggested methods are presented for applying information on the causes of alcohol abuse to the treatment of the disease. (20 ref)

3420. **Wilmotte, J. N.; Cosyns, P.; Mendlewicz, J. & Deschutter, B.** (Ctr of Suicide Prevention, Brussels, Belgium) **[A study of suicidal behaviors in a penitentiary.]** (Fren) *Acta Psychiatrica Belgica*, 1973(May), Vol 73(3), 411-426.—Conducted a study of 386 suicide attempts and 45 suicides which occurred in Belgian prisons during an 11-yr span. The sex distribution of the Ss corresponded roughly to that of the prison population in general. The age distribution of suicide attemptors was also similar to that of the prison population (with highest frequencies between 20 and 35 yrs), but successful suicides were relatively more frequent in later years (40-60 yrs). The most common methods for suicide attempts were wrist-slashing, jumping from heights, hanging, and drugs, but hanging accounted for 93% of the completed suicides. Conclusions are drawn from the data which can be helpful in improving suicide prevention in prisons. (French, Dutch, English, German, Italian, & Spanish summaries) (25 ref)—*E. Coché*

3421. **Wolfe, Bonnie.** (U Southern California) **A discussion of "Proxemics in deviant adolescents,"** by Robert C. Newman II & Donald Pollack. *Journal of Consulting & Clinical Psychology*, 1974(Oct), Vol 42(5), 749.—Discusses the statistical designs and methods of data analysis used by R. C. Newman and D. Pollack (see PA, Vol 50:968). The use of proxemic area as an independent variable is questioned, and the possibility that sequence and/or interaction effects may have accounted for the results is examined.

3422. **Zahn, Margaret A. & Ball, John C.** (Temple U) **Patterns and causes of drug addiction among Puerto Rican females.** *Addictive Diseases: An International Journal*, 1974, Vol 1(2), 203-213.—Studied medical and

nonmedical drug addiction patterns in 12 addicted and formerly addicted Puerto Rican females living in Puerto Rico. Data on demographic variables, addiction among relapsed Ss, and drug use, prostitution, and other crimes are presented. A possible relationship between drug abuse and female role expectations is also examined.

### Learning Disorders & Mental Retardation

3423. Ball, Thomas S. (Neuropsychiatric Inst.—Pacific State Hosp Research Group, Pomona, CA) **Note on "Effect of motor development on body image scores for institutionalized mentally retarded children."** *American Journal of Mental Deficiency*, 1974(Sep), Vol 79(2), 225-226.—Discusses the evaluation by W. C. Chasey et al (see PA, Vol 52:8002) of the use by M. P. Maloney et al (see PA, Vol 44:11088) of 2 measures of body image—the Eye, Hand, and Ear Test and the Personal Orientation Test—with mentally retarded children. Although Chasey et al stated that these measures did not meet their criteria of effectiveness, it is argued that both measures are appropriate to the assessment of the therapeutic effects of N. C. Kephart's (1971) sensorimotor training program as it has been adapted for retarded persons.

3424. Chalfant, James C. & Foster, Georgiana E. (U Arizona) **Identifying learning disabilities in the classroom.** *Slow Learning Child*, 1974(Mar), Vol 21(1), 3-14.—Emphasizes the importance of classroom teachers, who observe children daily in any program for identifying children with learning disabilities. However, teachers must understand what a learning disability is, how it affects learning, and what classroom indicators are encountered.

3425. Corkin, Suzanne. (Massachusetts Inst of Technology) **Serial-ordering deficits in inferior readers.** *Neuropsychologia*, 1974(Jul), Vol 12(3), 347-354.—Tested the hypothesis that reading disorders in children may in part grow out of a more general deficit in serial organization. The performance of 56 4-11 yr old boys classified as average, inferior, and prereaders was compared on 2 tasks that required them to remember the correct serial position of visual or auditory stimuli. The efficiency of all groups on this task increased markedly as a function of age. In conditions where greater demands were made upon immediate memory processes, the average readers surpassed the inferior readers at all ages studied. Crossed dominance of hand and eye was equally common within these 2 groups. (French & German summaries)—*Journal abstract*.

3426. Cornwell, Anne C. (Albert Einstein Coll of Medicine, Yeshiva U) **Development of language, abstraction, and numerical concept formation in Down's syndrome children.** *American Journal of Mental Deficiency*, 1974(Sep), Vol 79(2), 179-190.—Findings of A. C. Cornwell and H. G. Birch (see PA, Vol 44:5539) suggested the hypothesis that a marked discrepancy between verbal receptive and performance abilities exists in home-reared children with Down's syndrome. This was tested developmentally in 38 5-19 yr old Down's syndrome children. The data show differences between verbal items requiring extensive language expression (designation) and recognition of visually presented objects. Language expression was assessed in numerical

concepts and skills and concept formation. Developmentally, this population revealed a slow accretion of certain rote skills and progressive improvement in other abilities, but severe limitations in concept formation, abstraction, and higher level integrative abilities regardless of age. (27 ref)—*Journal abstract*.

3427. Denhoff, Eric. (Meeting Street School Children's Rehabilitation Ctr, Providence, RI) **The responsibility of the physician, parent, and child in learning disabilities.** *Rehabilitation Literature*, 1974(Aug), Vol 35(8), 226-230, 233.—Describes the physician's responsibilities in dealing with children who have learning disabilities: advocacy, early identification, quality health care, referral and interprofessional coordination, discrimination of program, and interpretation to the family.

3428. Drutu, Ioan. [Aspects of verbal memory in students of special auxiliary school.] (Romanian) *Studia Universitatis Babeş-Bolyai*, 1972, Vol 17, 31-39.—Carried out a study with 102 mentally retarded children. Each was asked to memorize a series of 15 words repeated 5 times. Characteristics of performance by these Ss are described. Results indicate that variations in verbal memory were directly related to degrees of mental retardation. (Russian & French summaries)—R. A. Meyer.

3429. Folkard, Simon. (MRC Applied Psychology Unit, U Sussex, Brighton, England) **Expectancy in educable subnormal children and their normal mental age controls.** *Quarterly Journal of Experimental Psychology*, 1974(Aug), Vol 26(3), 495-502.—The long reaction times of mentally subnormal children have commonly been attributed to an inability to build up an adequate preparatory set. The present experiment tested this suggestion by comparing the ability of normal and educable subnormal (ESN) children to anticipate a regularly occurring event. The performance of 12 13-yr-old ESN boys was found to be inferior to that of 12 9-yr-old boys matched on mental age (9 yrs) both in terms of the accuracy and the variability of their anticipations. This inferiority disappeared when visual input was restricted to the relevant events. It is concluded that ESN children suffer both in the accuracy and in the variability with which they estimate time intervals. It is suggested that these deficits may be mediated either by a relatively high level of distractibility or by a relatively low level of arousal. (19 ref)—*Journal abstract*.

3430. Freston, Cyrus W. & Drew, Clifford J. (U Utah) **Verbal performance of learning disabled children as a function of input organization.** *Journal of Learning Disabilities*, 1974(Aug-Sep), Vol 7(7), 424-428.—Investigated the recall performance of learning disabled children as a function of material organization and difficulty. 48 7-17 yr old children with organic brain syndrome and diagnosed as having learning disabilities were randomly subdivided into 2 groups receiving either organized or unorganized material. 3 levels of material difficulty were used. Results indicate no influence of material organization on Ss' recall performance. Ss did, however, perform differently as a function of material difficulty. Implications for future research and practice are discussed. (19 ref)—*Journal abstract*.

3431. Galkowski, Tadeusz. **Auditory reactions in mentally retarded children by means of psychogalvanic**

**reflexes.** *Audiology*, 1974, Vol 13(6), 501-505.—Examined 29 6-15 yr old male retardates and 32 normal children of matched mental age. Results obtained using psychogalvanic responses for acoustical (drum beat) stimuli show the usefulness of this method and its importance as a screening test or in standard audiometry. (French summary)

3432. **George, Colleen.** (North Texas State U) **Reliability estimates of grip strength assessments in the institutionalized mentally retarded.** *American Corrective Therapy Journal*, 1973(Nov), Vol 27(6), 173-175.—Describes a study done for the purpose of determining reliability coefficients for grip strength of the preferred and nonpreferred hands in each of 3 tonic neck postures. 48 students at the Denton State School in Texas with IQs between 50 and 90 were studied. It is concluded that the product moment correlation yields spuriously high reliability coefficients in this kind of situation and that the intraclass correlation coefficient is a better measure. Suggestions are made to study further these measurements. Simple and partial correlation coefficients were all greater than .95 while intraclass correlation coefficients were between .51 and .71.—R. S. Albin.

3433. **George, Colleen.** (North Texas State U) **Motor educability and chronological age as potential estimates of errors in perceptual-motor development of educable mentally retarded children.** *American Corrective Therapy Journal*, 1972(Jul), Vol 26(4), 105-111.—Describes a pilot study designed to estimate the degree of accuracy with which performances of educable mental retardates on tests of perceptual-motor skills could be predicted by chronological age. 12 male and 2 female educable mentally retarded students (IQ = 55-70) were studied. The Purdue Perceptual-Motor Survey was administered. Results show that chronological age in months significantly increased the accuracy of prediction. Also, when scores on the Johnson Test of Motor Educability were checked, they were highly correlated with those on the Purdue test. (16 ref)—R. S. Albin.

3434. **Gibson, David.** (U Calgary, Alberta, Canada) **Involuntary sterilization of the mentally retarded: A western Canadian phenomenon.** *Canadian Psychiatric Association Journal*, 1974(Feb), Vol 19(1), 59-63.—Describes the history of legislation governing involuntary sterilization of the mentally retarded in Canada. Some origins of the continuing eugenics debate are identified with a view to clarifying the issue and creating more rational solutions.

3435. **Gickling, Edward E. & Joiner, Lee M.** (U Tennessee) **Complex interactions of an auditory ability and aspiration in predicting specific reading deficits.** *American Journal of Mental Deficiency*, 1974(Sep), Vol 79(2), 162-168.—Demonstrated the curvilinear interaction—a personality variable—in the prediction of performance on 9 Spache Diagnostic Reading Scales. Of 49 11-26 yr old institutionalized mentally retarded Ss tested, those scoring high in auditory ability performed best on the reading criteria under the condition of "realistic" aspiration and performed poorest when aspiration scores indicated larger positive and negative discrepancy scores. Low auditory-ability Ss performed better under the conditions of positive discrepancy

(aspired performance exceeding attained performance). This form of interaction was observed repeatedly in 8 of the 9 reading diagnostic areas. An interpretation of the interaction effects and a discussion of the findings are included. (20 ref)—*Journal abstract.*

3436. **Gosling, Harrington & Jenness, David.** (Columbia U) **Temporal variables in simple reaction times of mentally retarded boys.** *American Journal of Mental Deficiency*, 1974(Sep), Vol 79(2), 214-224.—The effects of specific temporal factors in simple reaction time (RT) trials—foreperiod lengths of the target trial and of the trial preceding, and intertrial interval—were investigated in 12 nonretarded and 12 institutionalized retarded 14-20 yr old males. For both groups it was found that (a) RTs were shortest when the preliminary interval was equal to or greater than the prior preliminary interval, (b) RTs were impaired when the preliminary interval was less than the prior preliminary interval, and (c) the degree of impairment was directly referable to the differences between the 2 foreperiod values. All effects were significantly greater for the retarded than for the nonretarded Ss. Increasing the intertrial interval had little effect on the nonretarded Ss but tended to accentuate the obtained effects in the retarded Ss. Findings are interpreted as directly opposed to a stimulus-trace deficit theory but consistent with an expectancy model, with greater rigidity characterizing the retarded Ss. (29 ref)—*Journal abstract.*

3437. **Gottwald, Peter.** (Max Planck Inst for Psychiatry, Munich, W Germany) **[Several operant conditioning experiments with mentally retarded children.]** (Germ) *Zeitschrift für Klinische Psychologie*, 1972, Vol 1(1), 21-47.—Conducted series of operant conditioning experiments with 8 4-7 yr old children with severely retarded speech development to study learning processes and therapeutic techniques. 3 Ss suffered from Kanner's syndrome, 1 from severe mental retardation with autistic traits, 3 from deaf-mutism, and 1 from congenital acoustic agnosia. In a sequence of fully automated, programed and recorded tests and pretests, Ss examined the acquisition and establishment of positive conditioned reinforcers, the learning of correct performance in matching-to-sample discrimination tasks with pictures of food and toys as stimuli, the generalization to newly introduced visual stimuli, extinction, recovery and transfer to audiovisual stimuli matching tasks. All Ss were able to learn and solve the original matching tasks correctly. Ss presented strongly differing reactions to the secondary reinforcers introduced and built up during the tests and some parameters had to be changed before all Ss managed to perform correctly. A quick generalization to new visual stimuli was evident in all Ss, but of the 3 Ss who had not previously comprehended the meaning of words, only one learned to execute audiovisual matching correctly after a process of visual fading-out in combination with the voiced naming of the object to be matched. (English summary) (27 ref)—T. Fisher.

3438. **Hamilton, James L. & Budoff, Milton.** (Lesley Coll, School of Education, Cambridge, MA) **Learning potential among the moderately and severely mentally retarded.** *Mental Retardation*, 1974(Aug), Vol 12(4), 33-36.—Investigated the feasibility of M. Budoff and M. Friedman's (see PA, Vol 39:5651) learning potential

paradigm as an assessment approach with moderately and severely mentally retarded persons. 40 12-22 yr old institutionalized retardates were tested 3 times: initially, after 1 wk, and after 1 mo with a match-to-sample block design test. 20 were randomly assigned to a 30-min training session which occurred on the day prior to the 1st retest. Pretrained scores were positively correlated with Peabody Picture Vocabulary Test IQ. Improvement following training was not related to IQ, but was significantly related to 2 validity measures. (17 ref) —*Journal abstract.*

3439. Hatfield, Frances M. & Zangwill, O. L. (Cambridge Psychological Lab, England) **Ideation in aphasia: The picture-story method.** *Neuropsychologia*, 1974(Jul), Vol 12(3), 389-393.—Examined the ability of aphasics to communicate a sequence of events by drawing. Examples of this written communication obtained from a chronic male patient with expressive aphasia are presented. It appears that ideational processes in aphasia may be substantially intact in spite of severe defects in spoken and written expression. (French & German summaries)

3440. Holden, Edward A. (Edward R. Johnstone Training & Research Ctr, Bordentown, NJ) **Enumeration versus tracking during unimodal and multimodal sequential information processing in normals and retardates.** *Developmental Psychology*, 1974(Sep), Vol 10(5), 667-671.—Presented varying length pulse sequences to 24 16-yr-old educable retardates, 24 equal chronological age (CA) normals, and 24 9-yr-old equal mental age (MA) normals under 3 modality switching conditions and 2 response modes. Error magnitudes were greatest for retardates, less for equal-MA normals, and least for equal-CA normals. Error magnitudes also increased significantly from the no switching to maximum modality switching condition, from the enumeration to motor tracking response mode, and with increasing numerosities. Error increases from enumeration to tracking and from no switching to maximum modality switching rates were predominantly underestimations, confirming previous findings that attention shifting interferes with input or storage of stimulus number.—*Journal abstract.*

3441. Jones, Marshall B. (Pennsylvania State U, Milton S. Hershey Medical Ctr) **Nonassortative mating and small mean differences: A comment on the Reeds' family study.** *Social Biology*, 1973(Sep), Vol 20(3), 347-349.—Disputes the conclusion reached by E. W. Reed and S. C. Reed (1965) that there is no explanation for the "marrying down" by female retardates in nonassortative marriages. An explanation is offered based on reanalysis of statistical data.

3442. Marinoson, G. L. (Child Guidance Clinic, Middleton, England) **Performance profiles of matched normal, educationally subnormal and severely subnormal children on the revised ITPA.** *Journal of Child Psychology & Psychiatry & Allied Disciplines*, 1974(Apr), Vol 15(2), 139-148.—Compared the performance of matched groups of 30 normal, 30 educationally subnormal (ESN), and 30 severely subnormal (SSN) children, all of whom had a mental age of 5 yrs, on the revised Illinois Test of Psycholinguistic Abilities (ITPA). Results show that normals scored highest on all subtests, with ESNs next and SSNs scoring lowest. The largest

intergroup differences were found on the Visual Sequential Memory subtest, but significant differences were also found between normals and ESNs on Auditory Sequential Memory and between normals and SSNs on both reception subtests, Auditory Association and Auditory Sequential Memory. Both normals and ESNs showed preference for tests in the auditory-vocal channel over those in the visual-motor channel. Results are discussed in the light of previous ITPA findings, the special circumstances of this study, and the characteristics of the test battery. (28 ref)—*Journal summary*

3443. Matthews, Charles G. (U Wisconsin, Ctr for Health Sciences, Madison) **Applications of neuropsychological test methods in mentally retarded subjects.** In R. M. Reitan & L. A. Davison (Eds), *Clinical neuropsychology: Current status and applications*. Washington, DC: V. H. Winston & Sons, 1974. xiii, 417 p.—Presents mean scores and standard deviations for 3 WISC and 3 Wechsler-Bellevue Scale IQ groups obtained from 81 9-14 yr old institutionalized retardates and from another group of 286 Ss 15 yrs old and older. Methodological-clinical problems and potential contributions of neuropsychological investigations in mental retardation are discussed.

3444. McGavern, Maureen L. (Austin State School, TX) **Modeling behavior in echopraxic and non-echopraxic profoundly retarded subjects.** *American Corrective Therapy Journal*, 1972(Sep), Vol 26(5), 136-138.—Examined whether profoundly retarded Ss who are echopraxic perform differently on a motor imitation task subsequent to film viewing than do profound retardates in general. 11 echopraxic and 10 nonechopraxic males were studied. Measurements were made of chronological age and social quotient. Results show that the echopraxic group responded better to modeling than did nonechopraxic retardates. This is interpreted in terms of the echopraxic's special ability at motor imitation. (16 ref) —*R. S. Albin.*

3445. Preda, Vasile. [Qualities and limitations of the Kohs-Goldstein tests as a means of diagnosing mental retardation.] (Romanian) *Studia Universitatis Babes-Bolyai*, 1972, Vol 17, 41-53.—Administered the Kohs-Goldstein test to 200 mentally retarded children 9-14 yrs old and to 80 normal children 6-14 yrs old. Results were compared for diagnostic value with those of the Binet-Simon test (correlation .54) and the Bender Gestalt test (correlation .78). Since the Kohs-Goldstein test is directed toward the diagnosis of serious mental disorders, it should be used only as part of a larger diagnostic battery in the assessment of mildly retarded children. (Russian & English summaries)—*R. A. Meyer.*

3446. Rolf Jensen, Marchen. (Danish Coll for Educational Studies, Aarhus) **Some psychological patterns of functioning of children retarded in reading: Considerations of the relation between "brain-damage" and reading retardation.** (Danish) *Skolepsykologi*, 1974, Vol 11(4), 259-276.—Compared 11 5th-grade boys receiving remedial reading instructions with 11 others from the same socioeconomic level and having the same middle range of intelligence (as estimated by their teachers) with satisfactory reading performance. The purpose was to elucidate the relation between minimal cerebral dysfunction and emotional factors. Instruments used were (a) a

443

settings for mentally retarded children.—*Journal abstract.*

3454. Stephens, Beth et al. (Temple U) **Symposium: Developmental gains in the reasoning, moral judgment, and moral conduct of retarded and nonretarded persons.** *American Journal of Mental Deficiency*, 1974(Sep), Vol 79(2), 113-161.—Presents results from a longitudinal study on the development of Piagetian reasoning, moral judgment, and moral conduct. Findings are analyzed and tabulated for 2 2-yr testings of 75 nonretarded (IQ = 90-100) and 75 retarded (IQ = 50-75) 6-20 yr old Ss. Attention is also given to interrelationships which exist among scores on measures of reasoning, moral judgment, and moral conduct. Discussions of and reactions to the findings on reasoning are provided by J. M. Hunt; on moral judgment, by L. Kohlberg; and on moral conduct, by J. Aronfreed.—*Journal abstract.*

3455. Swartz, Jon D. (U Texas, Austin) **Motor development and body image: A reply to Ball.** *American Journal of Mental Deficiency*, 1974(Sep), Vol 79(2), 227-228.—Clarifies the intentions of W. C. Chasey et al (see PA, Vol 52:8002) in their article using body-image scores with mentally retarded children and cites reliability data supporting the use of the measures employed. Criticisms by T. S. Ball (see PA, Vol 53:Issue 2) of Chasey et al are answered, supporting the latter's study.

3456. Tanaka, Toshihiko & Matsuda, Tadahisa. (Osaka U, Lab of Psychology, Japan) **[A study of figure cognition by mentally retarded children: II. In comparison with normal children.]** (Japn) *Japanese Journal of Educational Psychology*, 1973(Jun), Vol 21(2), 111-115.—Compared the perception of geometric form by mentally retarded children with perception by normal Ss in order to find perceptual characteristics of the mentally retarded. 93 children with mental ages 4, 5, and 6 yrs performed recognition tasks, identifying forms similar to 6 standard groups. The data were compared with those of previous studies. Results show that the mentally retarded performed better in identifying topology than in identifying shape, and that normal Ss performed better ( $p < .01$ ) than the mentally retarded when mental age was equated.—*S. Choe.*

3457. Tzortzis, C. & Albert, M. L. (INSERM, Paris, France) **Impairment of memory for sequences in conduction aphasia.** *Neuropsychologia*, 1974(Jul), Vol 12(3), 355-366.—Administered matching, serial speech, word recognition and learning, and auditory perception tests, the Wechsler Memory Scale, and the Auditory Sequencing Test to 3 47-53 yr old patients with conduction aphasia, 3 23-41 yr old normal controls, and 2 patients (21 and 53 yrs old) with sensory aphasia and motor aphasia. Although the Ss with conduction aphasia could reproduce the items presented they could not recall the correct order of the items; this was true whether the material was verbal or nonverbal, auditory or visual, and whether the response was oral or by pointing. It is concluded that the disorder underlying the repetition defect in these 3 conduction aphasics is an impairment of their memory for sequences. Case reports of the patients with aphasia are appended. (French & German summaries)—*Journal abstract.*

3458. Vandever, Thomas R. & Neville, Donald D. (George Peabody Coll for Teachers) **Letter cues vs. configuration cues as aids to word recognition in retarded and nonretarded children.** *American Journal of Mental Deficiency*, 1974(Sep), Vol 79(2), 210-213.—63 mentally retarded and 54 nonretarded 6-7 yr old children were randomly assigned to 3 independent conditions (outline, contrast, and letter cue) in which they learned to read words written in a contrived orthography. In the outline condition, the words were outlined; in the contrast condition, they were surrounded by a black background; and in the letter-cue condition, the words were presented without configurational aids, and letter cues were stressed. Retarded Ss in the letter-cue group learned significantly more words than those in the other groups. The cues emphasized did not influence the numbers of words learned by the nonretarded Ss. It is suggested that teachers working with mildly mentally retarded beginning readers avoid stressing configuration cues.—*Journal abstract.*

3459. Woodruff, Michael L. (U Florida) **Subconvulsive epileptiform discharge and behavioral impairment.** *Behavioral Biology*, 1974(Aug), Vol 11(4), 431-458.—Reviews clinical and experimental reports regarding deficits in learning and memory as a result of subclinical epileptiform discharge. The effects of focal epileptic discharge upon behavior are compared to the effects produced by nonepileptic lesions of the same brain areas. It is suggested that whether or not epileptogenic discharge has behavioral consequences similar to ablation of the same brain region depends upon the intensity of the discharge and the extent to which the discharge spreads from the focus. Data which support the hypothesis that seizure discharge impairs retrieval of information more severely than storage are examined, and advantages and disadvantages of several methods for producing epileptiform discharge experimentally are discussed. It is suggested that relatively long-term changes in background EEG activity and cortical steady potential shifts may be the underlying physiological alterations responsible for the observed deficits, rather than simply the presence of epileptiform spike and wave discharges. (4½ p ref)—*Journal abstract.*

3460. Zimmermann Tansella, Christa. (U Padova, Inst of Clinical Psychiatry of Verona, Italy) **[Mental retardation: I. Problems of classification.]** (Ital) *Rivista di Psichiatria*, 1973, Vol 8(5), 541-564.—Reviews the evolution of the concept of mental retardation in various countries as reflected in terminology, definitions, and classifications. Heber's classification is discussed in detail with special reference to the problems of the relationship between intelligence, social abilities, etiology, and prognosis. (77 ref)

3461. Zimmermann Tansella, Christa. (U Padova, Inst of Clinical Psychiatry of Verona, Italy) **[Mental retardation: II. Problems of diagnosis.]** (Ital) *Rivista di Psichiatria*, 1973, Vol 8(5), 565-582.—Since low intelligence and inadequate social abilities are the most important criteria of mental retardation, those instruments commonly used to measure these factors are re-examined: the Stanford-Binet, the Wechsler Scales, the Vineland Social Maturity Scale, and the Progress Assessment Charts. It is concluded that the 1st 3 are

useful only for classification purposes and do not serve for intraindividual diagnosis, even though they are widely used for that purpose. The main reasons for their inadequacy are seen as the low reliability of the subtests and the lack of specific norms for mentally retarded reference groups. The Progress Assessment Charts are presented as an adequate approach to overcome such difficulties. (49 ref)—*Journal summary*.

3462. Zisfein, Laura & Rosen, Marvin. (Elwyn Inst, PA) **Self-concept and mental retardation: Theory, measurement, and clinical utility.** *Mental Retardation*, 1974(Aug), Vol 12(4), 15-19.—Examined the clinical use of 4 measures—a self-evaluation scale, a risk-taking task, a self-comparison scale, and level of aspiration—with 56 day and residential mentally retarded students. The 4 measures were significantly interrelated. Ss sorted as having extremely high or low self-concepts could also be identified by an independent evaluation based upon projective techniques, clinical impressions, and personal records. Results suggest the usefulness of these measures for professionals and nonprofessionals working with the mentally handicapped in assessing the varying self-concepts of their clients. (15 ref)—*Journal abstract*.

### Speech Disorders

3463. Andrews, Gavin & Cutler, Jeffrey. (U New South Wales, Sydney, Australia) **Stuttering therapy: The relation between changes in symptom level and attitudes.** *Journal of Speech & Hearing Disorders*, 1974(Aug), Vol 39(3), 312-319.—Assessed the reliability and validity of R. I. Erickson's scale (1969) for measuring communication attitudes in stutterers and nonstutterers by administering it to a control group of 25 nonstutterers on 2 occasions and to a group of 25 stutterers on 3 occasions during a therapy program: before treatment, after the instatement of fluency, and after transfer to everyday conversation. An analysis of the items led to the deletion of those not suitable for repeated administration. The resultant 24-item scale was a more valid and reliable measure of change in the communication attitudes of stutterers. The rate of change was compared with the changes in the level of stuttering. After stuttering stopped, the stutterers' scores did not equal those of the nonstutterers until they experienced speaking outside therapy. A follow-up study confirmed these results. After the removal of symptoms by behavior therapy, attitude change was only partial, and it was not until the patients completed a program of supervised experience that their attitudes changed to normal. (19 ref)—*Journal abstract*.

3464. Chester, Sondra L. & Egolf, Donald B. (Harmarville Rehabilitation Ctr, Pittsburgh, PA) **Nonverbal communication and aphasia therapy.** *Rehabilitation Literature*, 1974(Aug), Vol 35(8), 231-233.—Suggests that because of the general importance of nonverbal communication and its overwhelming importance to those having a language disorder, a counseling program on nonverbal communication be incorporated into aphasia therapy involving professionals, paraprofessionals, and others in the aphasic's environment. The categories of nonverbal communication included are organemics, cosmetics, costuming, proxemics, chronemics, oculistics, haptics, kinesics, objectics, and vocalics.—S. L. Warren.

3465. Gardner, Julie O. (California State U, Northridge) **Identification of children for speech and language referral.** *Journal of School Health*, 1974(May), Vol 44(5), 255-256.—Presents guidelines for the school nurse in detecting the child with a language handicap. Normal and abnormal aspects of articulation, voice, rhythm, and language, and the use of health records as a prescreening device are discussed.

3466. Hofmann, Joanne & Panagos, John M. (Kent State U, Div of Speech Pathology and Audiology) **Mothers' and non-mothers' semantic adaptation to deviant speech.** *Language & Speech*, 1973(Oct-Dec), Vol 16(4), 396-404.—Examined whether a group of 10 mothers of children with deviant speech and a matched group of 10 nonmothers could adapt their comprehension strategies to decode command sentences spoken by a child known to generate patterned deviant utterances. While Ss made significant improvement in their comprehension performance (adaptation), a significant difference between groups was not observed. It is suggested that perceptual adaptation to variant linguistic codes may be so basic to decoding performance that maternal experience with child speech would not provide mothers with a decoding advantage over native speakers engaged in everyday adaptive communication.—*Journal abstract*.

3467. Holbrook, Anthony; Rolnick, Michael I. & Bailey, Clayton W. (Florida State U) **Treatment of vocal abuse disorders using a vocal intensity controller.** *Journal of Speech & Hearing Disorders*, 1974(Aug), Vol 39(3), 298-303.—Used a portable voice intensity controller in a treatment program for patients with dysphonia related to vocal cord lesions and to laryngeal hypertension. The device, worn in daily speaking situations, provided auditory feedback contingent on excessive vocal intensity. Consequently, a soft vocal level was automatically maintained even in the presence of high-level environmental noise. The device proved to be an aid to vocal rehabilitation for the 32 patients studied, including complete resolution of disorders for 11 patients.

3468. MacDonald, James D. & Blott, Judith P. (Ohio State U) **Environmental language intervention: The rationale for a diagnostic and training strategy through rules, context, and generalization.** *Journal of Speech & Hearing Disorders*, 1974(Aug), Vol 39(3), 244-256.—Proposes the Environmental Language Intervention Strategy as a singular approach to the diagnosis and training of individuals with severely delayed expressive language. The strategy places in a clinical framework the semantically based approach to grammar of L. Bloom, I. M. Schlesinger, and R. Brown by selecting as the content for diagnosis and for training those 8 rules governing the semantic functions of early 2-word utterances in a variety of languages. The rules are elicited with linguistic and nonlinguistic cues that represent the full environmental context of the utterance. The strategy also samples and trains the early language rules in imitation, conversation, and play in order to include, from the beginning of intervention, procedures for training generalization of new language classes to spontaneous use. The theoretical rationale for the strategy is discussed, and operational definitions of the rules are presented.

The procedures for using the strategy in diagnosis and training are introduced. (16 ref)—*Journal abstract*.

3469. **Quarrington, Bruce.** (York U. Downsview, Ontario, Canada) **The parents of stuttering children: The literature re-examined.** *Canadian Psychiatric Association Journal*, 1974(Feb), Vol 19(1), 103-110.—A review of the literature on personality, attitudes, and behavior of the parents of stuttering children suggests that parents are low in social dominance and that the mothers of beginning stutterers are particularly permissive or passive regarding the shaping and control of the developing child's behavior. Although instructional passivity appears to persist in the mothers of chronic stutterers, specific punitive attitudes also emerge. The roles of instructional passivity and punitive parental reactivity in the precipitation and maintenance of stuttering behaviors are briefly considered. (French summary) (16 ref)—*Journal summary*.

3470. **Suga, Tetsuo & Otake, Nobuko.** [On "commanding-to-write" behavior: A case study.] (Jpn) *Japanese Journal of Educational Psychology*, 1972(Dec), Vol 20(4), 216-225.—Devised a numerical coding system of Japanese letters and numbers for a 12-yr-old girl who was unable to speak because of serious impairment of general motor function caused by cerebral palsy. In 11 training sessions with a simple apparatus specially constructed for the S, she was able to use the coding system for verbal communication. Educational implications for persons having speech disorders are considered to be important. (English summary)—*S. Choe*.

3471. **Vicker, Beverly A. (Ed.).** (U Iowa, Hosp School) **Nonoral communication system project 1964/1973.** Iowa City, IA: Campus Stores, 1974. 261 p.—Presents a collection of 5 papers on the various means of communication available for persons who, although they lack the motor coordination to produce intelligible speech, do have intact abilities for language comprehension and formulation. The use of communication boards by a group of cerebral palsied children is described, along with the design of individualized nonoral vocabulary materials, suggestions for a habituation program, and evaluation procedures. Sample materials and blueprints for equipment are included.

### Physical & Toxic Disorders

3472. **Abse, D. Wilfred et al.** (U Virginia Hosp) **Personality and behavioral characteristics of lung cancer patients.** *Journal of Psychosomatic Research*, 1974(Apr), Vol 18(2), 101-113.—Conducted psychiatric interviews which focused upon some of the variables thought to be relevant to the distinction between cancer-prone personalities and other personalities. 59 patients, 31 later diagnosed as having lung cancer and 28 as having general cancer-free thoracic problems, were interviewed in terms of these variables. Results show that patient groups could be successfully discriminated from one another only when behavior patterns were included in the analysis and were interpreted relative to the patient's age. Findings support the age hypothesis; i.e., that young cancer patients more frequently demonstrate and more clearly portray the characteristics attributed to lung cancer patients in general. (45 ref)—*W. G. Shipman*.

3473. **Alpert, Jack N.** (Baylor Coll) **Failure of fixation suppression: A pathologic effect of vision on caloric nystagmus.** *Neurology*, 1974(Sep), Vol 24(9), 891-896.—Defines an ocular-fixation index as a measurement for determining the presence of failure of fixation suppression in 21 9-78 yr old patients as compared with 30 normal controls. The ocular-fixation index of slow-phase velocity best separated normal from abnormal caloric responses. Patients showing failure of fixation suppression by these criteria had a high incidence of posterior fossa lesions.

3474. **Assal, G.** (Service U de Neurochirurgie Hôpital Cantonal, Lausanne, Switzerland) [Problems in the auditory reception of language associated with lesions of the cerebral cortex.] (Fren) *Neuropsychologia*, 1974(Jul), Vol 12(3), 399-401.—Presents the results of a test of phonemic discrimination administered to Ss with unilateral cerebral left or right lesions. Poor performances among Ss with anterior left lesions are discussed. (German summary)

3475. **Beaumanoir, A.; Ballis, T.; Varfis, G. & Ansari, K.** (Out-patient Dept of the Pediatric Clinic, Geneva, Switzerland) **Benign epilepsy of childhood with Rolandic spikes: A clinical, electroencephalographic, and telencephalographic study.** *Epilepsia*, 1974(Sep), Vol 15(3), 301-315.—26 cases of "benign epilepsy of childhood" with Rolandic spikes, thoroughly studied clinically and electroencephalographically, were compared with 26 patients with petit mal or petit mal and grand mal seizures. Momentary alterations of consciousness (absences) could be detected in a fair number of children with "benign epilepsy." Rolandic spikes and Mu rhythms were found almost exclusively in patients having convulsions, whether focal or generalized. Rolandic spikes associated with Mu rhythms and bilaterally synchronous or asynchronous discharges of spikes of spike-and-slow-waves seem, therefore, to be the features of an epilepsy whose clinical manifestations (absences or convulsions) may depend on the psycho-biophysiological background.—*Journal summary*.

3476. **Becker, R. D.** **Minimal cerebral (brain) dysfunction—clinical fact or neurological fiction? The syndrome critically re-examined in the light of some hard neurological evidence.** *Israel Annals of Psychiatry & Related Disciplines*, 1974(Jun), Vol 12(2), 87-106.—Presents a systematic review of the current theoretical, empirical, and clinical controversies in the fields of developmental and psychological medicine, pediatrics, and child psychiatry and neurology, stressing the diagnostic value and potential usefulness of the designation of minimal brain dysfunction (MBD). An attempt is made to redefine the etiological, symptomatic, neuropsychological, and behavioral correlates of the MBD syndrome. The clinical diagnostic value of "soft" and "hard" neurological signs is reexamined and equivocal and/or nonspecific outcomes of neuropsychological examinations are described. The psychological reality of the MBD child and the secondary emotional consequences are considered. Cognitive, affective, behavioral, developmental, communicative, social, and learning correlates of the MBD syndrome are defined, and some guidelines for establishing an early recognition and diagnosis are presented. (49 ref)—*Journal abstract*.

3477. **Boll, Thomas J.** (U Washington) **Behavioral correlates of cerebral damage in children aged 9 through 14.** In R. M. Reitan & L. A. Davison (Eds), *Clinical neuropsychology: Current status and applications*. Washington, DC: V. H. Winston & Sons, 1974. xiii, 417 p.—Reviews the literature, discusses the validity of the Halstead Neuropsychological Test Battery for Children, and presents results of administering extensive psychometric and ability tests to matched groups of brain-damaged and normal 9-14 yr old Ss. Empirical data on qualitative vs quantitative changes in adaptive abilities of brain-lesioned children are described, and the use of multiple inferential methods to assess the effect of cerebral impairment on motor and tactile-perceptual functioning is cited.
3478. **Cameron, Paul & Robertson, Donald.** (U Louisville) **Effect of home environment tobacco smoke on family health.** *Journal of Applied Psychology*, 1973(Apr), Vol 57(2), 142-147.—Replicated and extended earlier research by P. Cameron et al in 1969 that indicated a greater prevalence of respiratory illness among children subjected to tobacco smoke in the home environment. A random phone sample of 2,626 households in Detroit, Michigan and in Long Beach and Pasadena, California, yielded evidence suggesting that (a) children subjected to tobacco smoke in the home environment have a greater prevalence of acute illness when compared to children in smoke-free environments, (b) adult nonsmokers subjected to tobacco smoke in the home environment may have a greater prevalence of acute illness than adult nonsmokers who reside in a smoke-free environment, and (c) respiratory illness rates may be related to air pollution rates in metropolitan areas.—*Journal abstract*.
3479. **Carey, Raymond G.** (Lutheran General Hosp, Park Ridge, IL) **Emotional adjustment in terminal patients: A quantitative approach.** *Journal of Counseling Psychology*, 1974, Vol 21(5), 433-439.—Used a quantitative approach to identify factors relating to emotional adjustment in 84 13-82 yr old dying patients. 11 hospital chaplains collected data by interviewing the patients. Results indicate that emotional adjustment to the awareness of a limited life expectancy was not related principally to religious orientation, although this was an important factor. Emotional adjustment was influenced more by the patient's physical condition (level of discomfort), by previous experiences with dying persons, and by interpersonal relationships. The most important aspect of the religious variable was the quality of religious orientation rather than mere religious affiliation or verbal acceptance of religious beliefs.—*Journal abstract*.
3480. **Cherington, Michael.** (U Colorado, Medical Ctr, Denver) **Visual neglect in a chess player.** *Journal of Nervous & Mental Disease*, 1974(Aug), Vol 159(2), 145-147.—Describes a chess game in which one player, the patient, had a right parietal lobe lesion. His performance tended to support the concept that many factors are involved in visual neglect. It is believed that this is the 1st case reported in which visual neglect is demonstrated on the chess board.
3481. **Comings, David E. & Amromin, George D.** (City of Hope National Medical Ctr, Durate, CA) **Autosomal dominant insensitivity to pain with hyperplastic myelinopathy and autosomal dominant indifference to pain.** *Neurology*, 1974(Sep), Vol 24(9), 838-848.—Describes 2 forms of aberrant sensation to pain: autosomal dominant insensitivity to pain and autosomal dominant indifference to pain. The case histories of 2 families are detailed, in one of which electron microscopy of the sural nerves demonstrated a unique abnormality of myelin that has been termed hyperplastic myelinopathy. The unmyelinated C fibers were normal, while the medium- or large-sized myelinated fibers were involved, indicating the importance of the latter in pain sensation. (48 ref)
3482. **Cramer, Kathryn D. & Eber, Norman P.** (Central Inst for the Deaf, St Louis, MO) **A spondee recognition test for young hearing-impaired children.** *Journal of Speech & Hearing Disorders*, 1974(Aug), Vol 39(3), 304-311.—10 spondaic words recorded on Language Master cards were presented monaurally through insert receivers to 58 5-9 yr old hearing-impaired children to evaluate their ability to recognize familiar speech material. Ss were tested individually until their performance stabilized—which required from 4 to 10 sessions. They indicated their responses by pointing to labeled picture cards. Spondee recognition scores were bimodally distributed, with clusters of scores of 0-65% and 66-100%, respectively. In general, pure-tone averages better than 93 db HTL (hearing-threshold level) were associated with spondee scores from 66 to 100%, while pure-tone averages poorer than 103 db HTL corresponded to spondee scores from 0 to 65%. No close relation between pure-tone thresholds and spondee recognition scores was found for average hearing levels between 93 and 103 db. Recognition scores varied as a function of repeated testing in 3 general ways: stable performance, steadily improving performance, or inconsistent performance.—*Journal abstract*.
3483. **Dague, P.** [Applications of the Marianne Frostig Test of Maturation of Visual Perception in schools.] (Fren) *Revue de Psychologie Appliquée*, 1974, Vol 24(2), 77-86.—Reports on the probable usefulness of the Frostig Test of Perceptual Maturation in diagnosis of visual handicaps, psychomotor disorders, and mental retardation. The test measures visual-motor coordination, discrimination of figure and ground, constancy of geometrical form, positioning in space, and spatial relations.
3484. **Davidson, Philip W.; Barnes, Judith K. & Mullen, Gina.** (Washington Coll) **Differential effects of task memory demand on haptic matching of shape by blind and sighted humans.** *Neuropsychologia*, 1974(Jul), Vol 12(3), 395-397.—Studied the role of prior perception experience in retention of haptic information by comparing 22 blind and 23 sighted adolescents (matched for IQ) in a matching task that systematically varied task memory demand. Results indicate that whereas greater memory demand reduced retention for both groups of Ss, the blind showed better retention under such memory demand than did the sighted. The outcome was interpreted in light of the effects of prior experience in gathering information by hand, on the way the stimulus is explored, and the way it is coded. (French & German summaries)—*Journal abstract*.

3485. Davison, Leslie A. (U California, San Francisco) **Introduction.** In R. M. Reitan & L. A. Davison (Eds), *Clinical neuropsychology: Current status and applications*. Washington, DC: V. H. Winston & Sons, 1974. xiii, 417 p.—Discusses concepts frequently encountered in the study of clinical brain-behavior relations; the utility of clinical neuropsychology and its relationships to its primary referral sources—neurology, neurosurgery, and psychiatry; and differences between clinical psychological and clinical neuropsychological approaches to the assessment of brain damage.

3486. Falicki, Zdzislaw & Pilasiewiczowa, Barbara. (Bialystok-Choroszcz Medical Academy, Clinic for Mental Diseases, Poland) **[Histopathological studies of skin segments in schizophrenic patients: A preliminary report.]** (Poln) *Psychiatria Polska*, 1972(Sep), Vol 6(5), 519-521.—Fine roundcelled infiltrations around capillaries were found in segments of macroscopically unchanged skin in 7 out of 10 cases of schizophrenia and in 8 out of 10 members of a control group of mentally retarded individuals. Because such changes occur frequently in psychiatric patients, these studies will be continued and expanded. (Russian summary)

3487. Fidel, Edward A. & Ray, Joseph B. (Texas Tech U) **The validity of the Revised Objective Perceptual Test in differentiating among nonorganic, minimally organic, and grossly organic children.** *Journal of Special Education*, 1972(Fal), Vol 6(3), 279-284.—Administered a revision of L. Hays's 1968 Objective Perceptual Test (OPT) to 40 nonorganic, 40 minimally organic, and 20 grossly organic children (age range, 5.5-9.5 yrs) to determine its diagnostic effectiveness. The OPT differentiated nonorganic from organic Ss and minimally organic from nonorganic Ss with a high degree of accuracy. It differentiated minimally organic from nonorganic Ss more effectively (84%) than did the Bender-Gestalt Test (B-G) scored according to the Koppitz procedure (63%). Consideration of both Revised OPT and B-G performance resulted in a more accurate diagnosis (94%) between minimally organic and organic Ss than when either test was considered alone. It is noted that the Revised OPT has several advantages when compared to the majority of psychological tests used to detect organicity in children: objective scoring, rapid administration and scoring, high degree of validity, empirical norms for perceptual development, and differentiation of expressive from receptive disorders.—*Journal abstract.*

3488. Friedman, Gary D.; Ury, Hans K.; Klatsky, Arthur L. & Siegelau, A. B. (Kaiser-Permanente Medical Care Program, Oakland, CA) **A psychological questionnaire predictive of myocardial infarction: Results from the Kaiser-Permanente epidemiologic study of myocardial infarction.** *Psychosomatic Medicine*, 1974(Jul), Vol 36(4), 327-343.—Administered a 155-item psychological questionnaire to 330 multiphasic examinees who subsequently developed a well-documented first myocardial infarction (MI). 2 control groups who were matched for age, race, and sex and who remained free of MI were selected from multiphasic examinees; 1 group was additionally matched to the cases for standard coronary risk factors. Responses to several questionnaire items were associated with subsequent MI to a statistical-

ly significant degree, and a further test indicated that the questionnaire as a whole contained more associated items than would be expected by chance. Outside experts selected items to represent certain psychological traits hypothesized as predicting MI. Items representing "emotional drain" and "somatization" proved to be associated with subsequent MI, but these relationships were no longer apparent when Ss with coronary symptoms and diagnoses at the time of testing were removed from the study group. Sets of items representing certain other traits were not significantly predictive, except for those representing "anxiety-neuroticism," in the symptom-free subgroup. It is concluded that in studying factors predicting MI, care should be taken that psychological traits are not confused with symptoms of coronary heart disease. (16 ref)—*Journal abstract.*

3489. Gajdusek, D. C.; Garruto, R. M. & Dedecker, R. (NIH, Inst of Neurological Diseases & Stroke, Bethesda, MD) **Congenital defects of the central nervous system associated with hyperendemic goiter in a neolithic highland society of Western New Guinea.** *Human Biology*, 1974(May), Vol 46(2), 339-344.—Obtained birth weights and infantile growth rates for 73 male and female newborns, representing a total of 438 longitudinal weight measurements, for the Mulia population of the Central Highlands of Western New Guinea at an early period of cultural contact. The newborns and infants represent offspring from a population severely affected with goiter and cretinism and associated mental and motor defects, but none of the infants were diagnosed as cases of severe congenital cretinism. The birth weights of Mulia infants are among the lowest reported for New Guineans, which may in part be the result of the severely protein-deficient diet of pregnant mothers in the Mulia valley. Longitudinal growth curves in Mulia infants are generally similar to those found in other protein-deficient New Guinea populations.—S. L. Warren.

3490. Garrie, Erica V.; Garrie, Stuart A. & Mote, Thomas. (St Mary's U) **Anxiety and atopic dermatitis.** *Journal of Consulting & Clinical Psychology*, 1974(Oct), Vol 42(5), 742.—Reports that 45 Ss with atopic dermatitis had significantly higher A-State and A-Trait anxiety (measured by the State-Trait Anxiety Inventory) than 45 Ss with pityriasis rosea (a nonitchy skin disease) or 45 normal control Ss.

3491. Goldberg, Richard T. (Massachusetts Rehabilitation Commission, Boston) **Adjustment of children with invisible and visible handicaps: Congenital heart disease and facial burns.** *Journal of Counseling Psychology*, 1974, Vol 21(5), 428-432.—26 11-15 yr old children with congenital heart disease and 22 with facial burns were compared on 10 measures of adjustment to test the effects of invisible and visible disability upon social and psychological development. Interview data were coded and submitted to analysis of covariance, using sex, grade, and age as covariates. The invisible disability group (the heart group) was higher in adjustment in all 10 measures. Significant differences ( $p < .01$ ) were obtained on vocational aspirations, origin of interest in vocational aspiration, career plans after high school, self-image, and work values. It is concluded that an invisible disability with severe physical limitations has fewer deleterious effects upon social adjustment than does a visible

disability without physical limitations such as facial disfigurement. (20 ref)—*Journal abstract*.

3492. Gorsuch, Richard L. & Key, Martha K. (George Peabody Coll for Teachers, John F. Kennedy Ctr for Research on Education & Human Development) **Abnormalities of pregnancy as a function of anxiety and life stress.** *Psychosomatic Medicine*, 1974(Jul), Vol 36(4), 352-362.—Measured states of anxiety and magnitude of life change surrounding the pregnancies of 111 low-income clinic patients, using the State-Trait Anxiety Inventory and a life change inventory. Results indicate that anxiety around the 1st trimester was related to abnormalities of pregnancy, parturition, and infant status. Life stress during the 2nd and 3rd trimesters was similarly associated with the same measure of abnormalities. Anxiety and life stress independently contributed to abnormalities of pregnancy and were critical at different times. Evidence did not suggest that either anxiety or life stress before conception influences the course and outcome of pregnancy. (23 ref)—*Journal abstract*.

3493. Hackett, T. P. & Cassem, N. H. (Massachusetts General Hosp, Boston) **Development of quantitative rating scale to assess denial.** *Journal of Psychosomatic Research*, 1974(Apr), Vol 18(2), 93-100.—Devised a single rating scale item for each of the behavioral traits empirically noted among major deniers and for several specific questions about fear, making a 33-item scale. The scale was then applied to interviews with 63 male and 26 female coronary patients 29-80 yrs old (mean age, 58.2 yrs). Patients were divided into 3 groups according to amount of denial used and each person was interviewed from 3 to 10 times during his hospital stay. The desired range of scale scores (4-53 in this sample) was achieved. The ability of the scale scores to differentiate the 3 clinical groups was highly significant. Differences between pairs of mean scores for each of the 3 denial groups were also highly significant. (21 ref)—W. G. Shipman.

3494. Hegenscheidt, Marianne & Cohen, Rudolf. (Max Planck Inst for Psychiatry, Munich, W Germany) **[Determination of cognitive flexibility in brain-damaged persons.]** (Germ) *Zeitschrift für Klinische Psychologie*, 1972, Vol 1(1), 1-20.—Tested 3 measures of cognitive rigidity and flexibility for their differential-diagnostic value in detecting organic brain damage. Ss were male patients 25-65 yrs old (250 brain damaged, 65 schizophrenic, 27 depressed) and 96 normal controls tested in groups matched in age, education, and intelligence. Ss were given the Trailmaking Test, Form B (for letter and number alteration, with part A—for numbers only—partialled out); the Stroop Color-Word Test (for reading and naming, with naming partialled out); and a dichotic hearing test (with numbers and letters and right vs left ear recall, with a dichotic digit-span score partialled out). These tests, designed to obtain cognitive flexibility measures, were preceded by control tests which were similar in all respects but did not require Ss to shift rapidly between different sets of instructions. The 2 test series were correlated to obtain "pure" flexibility measures. Brain-damaged Ss performed significantly less well than normal controls in the 1st 2 tests; no separation was achieved in the 3rd test. None of the tests could separate Ss with organic brain damage from the 2

psychotic groups. The 3 measures did not correlate with each other, or with tests that reliably discriminated the groups. It is concluded that the concept of cognitive flexibility cannot be defended. (English summary) (20 ref)—T. Fisher.

3495. Heyde, W. & Aban, P. [Marital conflict among patients under treatment for gynecological conditions and breast cancer.] (Germ) *Praxis der Psychotherapie*, 1973(Apr), Vol 18(2), 49-54.

3496. Keenan, Joseph S. & Brassell, Esther G. (VA Hosp, Atlanta, GA) **A study of factors related to prognosis for individual aphasic patients.** *Journal of Speech & Hearing Disorders*, 1974(Aug), Vol 39(3), 257-269.—Reviewed the clinical records of 39 21-79 yr old aphasic patients in order to identify and correlate factors noted in the initial examination with the patients' progress in communicative performance. 3 nonlanguage variables (age, general health, and regularity of employment) and language variables (listening performance, talking performance, reading performance, writing performance, motor speech impairment, and speech stimulability) were studied. Results suggest that a high rate of prognostic accuracy may be attained through the application of some simple clinical observations concerning the patients' speech performance. (15 ref)—*Journal abstract*.

3497. Kenigsberg, Daniel et al. (Wesleyan U) **The coronary-prone behavior pattern in hospitalized patients with and without coronary heart disease.** *Psychosomatic Medicine*, 1974(Jul), Vol 36(4), 344-351.—Compared 42 22-64 yr old male and female hospitalized patients with coronary heart disease (CHD) and 42 with noncardiovascular diseases in terms of selected behavioral variables. Coronary patients were from the postcoronary unit and controls were patients hospitalized for surgery or traumatic injury. The major behavioral assessment was the Jenkins Activity Survey (JAS) designed to measure the coronary-prone behavior pattern (Type A), and used with female CHD patients for the first time in this study. CHD patients, both male and female, exhibited more Type A behavior and were more hard-driving than those with other health crises. These results replicate earlier findings from a large retrospective analysis of an industrial study. The differences observed were evaluated in terms of other demographic variables and found not to be influenced by them. —*Journal abstract*.

3498. Kinney, Jo A. & McKay, Christine L. (US Naval Submarine Medical Research Lab, Groton, CT) **Test of color-defective vision using the visual evoked response.** *Journal of the Optical Society of America*, 1974(Sep), Vol 64(9), 1244-1250.—Describes a new technique for detecting color-defective individuals, based upon the isolation of a pattern response from the visual evoked response. Specifically designed targets were produced from equal-luminance hues that lie on the confusion lines of deuteranopes, protanopes, and tritanopes. 16 color normals, 8 deuteranopes, 8 protanopes, and 1 tritanope were tested with these targets. Results show that color normals gave a pattern response to patterns formed of hue differences only; this response was similar to that produced by luminance differences. Color-defective individuals, however, gave no pattern response to

targets formed of hues that they could not discriminate, although they gave pattern responses for luminance differences. (23 ref)—*Journal abstract*.

3499. Klonoff, Harry & Low, Morton. (U British Columbia, Vancouver, Canada) **Disordered brain function in young children and early adolescents: Neuropsychological and electroencephalographic correlates.** In R. M. Reitan & L. A. Davison (Eds), *Clinical neuropsychology: Current status and applications*. Washington, DC: V. H. Winston & Sons, 1974. xiii, 417 p.—Used discriminant analysis of variance to determine the relationships between neuropsychological status, neurological-minimal cerebral dysfunction (MCD) ratings, and EEG ratings. In a comparison of acute head-injured, chronic brain-damaged, MCD, and normal children, a high degree of success was achieved in predicting neurological, MCD, and EEG ratings from neuropsychological data, resulting in the emergence of differential age-etiology interaction patterns.

3500. Klonoff, Harry & Paris, Robert. (U British Columbia, Vancouver, Canada) **Immediate, short-term and residual effects of acute head injuries in children: Neuropsychological and neurological correlates.** In R. M. Reitan & L. A. Davison (Eds), *Clinical neuropsychology: Current status and applications*. Washington, DC: V. H. Winston & Sons, 1974. xiii, 417 p.—Examined the neuropsychological status of children under 9 yrs of age and over 9 yrs of age ( $N = 231$ ) who had been hospitalized with head injuries. One and two years after trauma a higher incidence of developmental anomalies, positive premorbid factors, and sequelae were found in the younger boys, and a higher incidence of head injuries and assignment of blame to others was found for the younger girls. The older children had a higher occurrence of anterograde amnesia.

3501. Klove, Hallgrim & Matthews, Charles G. (U Bergen, Norway) **Neuropsychological studies of patients with epilepsy.** In R. M. Reitan & L. A. Davison (Eds), *Clinical neuropsychology: Current status and applications*. Washington, DC: V. H. Winston & Sons, 1974. xiii, 417 p.—Results of 3 studies of selected classifications of epileptic patients show that (a) the known organic etiology of epilepsy is of more significance than the seizure manifestations for determining impairment level of neuropsychological functioning, (b) major motor seizures of known etiology impair psychological abilities more than seizures of unknown etiology, and (c) determination of impairment levels from major seizures of unknown as opposed to known etiology is dependent on inclusion of age-at-onset in the experimental design.

3502. Klove, Hallgrim. (U Bergen, Norway) **Validation studies in adult clinical neuropsychology.** In R. M. Reitan & L. A. Davison (Eds), *Clinical neuropsychology: Current status and applications*. Washington, DC: V. H. Winston & Sons, 1974. xiii, 417 p.—Traces the background and development of the Halstead Neuropsychological Test Battery and of the Wechsler-Bellevue Scales and discusses studies from the literature which have used the tests to assess the organic integrity of the cerebral hemispheres and the laterality of brain damage in adults.

3503. Kristianson, Per. (U Uppsala, Sweden) **A comparison between the personality changes in certain forms of psychomotor and grand-mal epilepsy.** *British*

*Journal of Psychiatry*, 1974(Jul), Vol 125, 34-35.—Assessed the MMPI profile of a 34-yr-old male grand-mal epileptic patient. S's elevated scores on the Depression and Psychopathic Deviate scales suggest the existence of a syndrome of epileptic personality change and the utility of the MMPI in differentiating the psychopathology of certain forms of psychomotor and grand-mal epilepsy.

3504. Lazarus, Gary M. **The visual evoked potential, its clinical application in the investigation of cortical functioning and in the detection of neuro-ophthalmic pathology.** *Journal of the American Optometric Association*, 1974(Jul), Vol 45(7), 850-855.—Presents a brief history of the development of the EEG, and describes the electrophysiology of the cerebral cortex and its continuous activity, physiological basis, and evoked potential.

3505. Lenard, Hans-Gerd & Schulte, Franz-Josef. (U Göttingen, W Germany) **Sleep studies in hormonal and metabolic diseases of infancy and childhood.** In O. Petre-Quadens & J. D. Schlag (Eds), *Basic sleep mechanisms*. New York, NY: Academic Press, 1974. xix, 459 p. \$23.50.—Traces the development of research on sleep in infants and children and discusses EEG and polygraphic data from studies of sleep patterns in hypothyroidism and phenylketonuria.

3506. Leslie, Wendy J. & Greenberg, David A. (Massachusetts Coll of Optometry, Boston) **Headache: Discussion, classification and differential diagnosis for the optometrist: I.** *Journal of the American Optometric Association*, 1974(Jul), Vol 45(7), 827-832.—Presents the 1st of a 2-part series giving the practicing optometrist a working knowledge of headaches. The physiologic basis of head pain, classification and differential diagnosis of the more frequently occurring headaches, and a short glossary of neurological terms associated with headache descriptions are included.

3507. Lipowski, Z. J. (Dartmouth Coll, Medical School) **Sensory overloads, information overloads and behavior.** *Psychotherapy & Psychosomatics*, 1974, Vol 23(1-6), 264-270.—Reviews research results which support the thesis that a hallmark of technological societies is the ubiquity of conditions which result in sensory and information overloads for many persons. It appears that information overloads give rise to psychophysiological effects which may lead to behavioral and somatic pathology and are thus an important subject for psychosomatic investigators. (20 ref)—*Journal abstract*.

3508. Meier, Manfred J. (U Minnesota) **Some challenges for clinical neuropsychology.** In R. M. Reitan & L. A. Davison (Eds), *Clinical neuropsychology: Current status and applications*. Washington, DC: V. H. Winston & Sons, 1974. xiii, 417 p.—Discusses the concept of localization of brain damage according to lateral, cephalocaudal, and vertical axes and considers related developments in modern behavioral neurology and human physiological psychology. Longitudinal applications and use of predictor and outcome-criteria batteries are described.

3509. Mormont, C. & Servais, J. (U Liège, Psychiatric Clinic, Belgium) **[The Rorschach of a young seizure-free epileptic patient.]** (Fren) *Acta Psychiatrica Belgica*, 1973(May), Vol 73(3), 379-386.—Reports the case study

of a 12-yr-old female epileptic who was not presenting seizures but who appeared to suffer from a behavior disorder. The study exemplifies the role the Rorschach test can play in the early detection of such disorders. The epileptic component had been overlooked but was later confirmed by EEG. Specific treatment produced improvement of the behavior disturbance. (French, Dutch, English, German, Italian, & Spanish summaries)—*E. Coché*

3510. Neumärker, Klaus J.; Neumärker, Marianne & Pose, Ursel. (Berlin-Lichtenberg Neurological & Psychiatric Hosp, E Germany) [On the psychopathology of psycho-motor seizures in childhood.] (Germ) *Psychiatrie, Neurologie und medizinische Psychologie*, 1974(Mar), Vol 26(3), 165-175.—Reviews the literature on psychopathic incidents related to permanent and episodic disturbances associated with epilepsy. Personality characteristics are hypothesized based on study of 15 patients with a diagnosis of psychomotor epilepsy and damage to ascribable structures of the limbic system. (55 ref)

3511. Nickel, Bernd; Neumann, Jochen & Schirmer, Siegfried. (Humboldt U Berlin, Nerve Clinic, E Germany) [The forensic significance of pneumoencephalographic findings.] (Germ) *Psychiatrie, Neurologie und medizinische Psychologie*, 1974(Mar), Vol 26(3), 144-150.—Suggests that diminished capacity due to cerebral imbalance at the time of a criminal offense can be positively related to pathological pneumoencephalographic findings. In a case of questionable decompensation at the time of a crime, the assumption of psychological imbalance can be justified only by a definite corroborative finding of pathological EEG.

3512. Norris, T. W.; Stelmachowicz, P.; Bowling, C. & Taylor, D. (U Nebraska, Medical Ctr, Div of Audiology, Omaha) Latency measures of the acoustic reflex. *Audiology*, 1974, Vol 13(6), 464-469.—Obtained an ordered series of latency measures of the acoustic reflex on 23 normal-hearing and 23 sensorineural hearing-impaired Ss (mean ages = 22 and 14 yrs, respectively). 5 parameters from each reflex recording were defined and measured. Statistical analysis revealed no difference between the 2 groups for the contraction or initial portion of the response. However, following the cessation of the stimulus, the sensorineural group demonstrated a significantly longer relaxation time. (French summary)—*Journal abstract*.

3513. Perret, E. (U Zurich, Switzerland) The left frontal lobe of man and the suppression of habitual responses in verbal categorical behaviour. *Neuropsychologia*, 1974(Jul), Vol 12(3), 323-330.—Hypothesized that previously reported findings of a reduction in word fluency caused by left frontal lesions is due to the coincidence of lesions in the left hemisphere entailing verbal deficits generally and frontal lesions producing deficits in the ability to suppress habitual behavior to adapt to unusual situations. A test of word fluency and a modification of the Stroop Color-Word Test were given to 118 patients with circumscribed cerebral lesions. Data to 118 patients with circumscribed cerebral lesions confirm the deficit in word fluency after left frontal lesions reported earlier. Left frontal lesions produced an increasing performance deficit as compared with lesions localized elsewhere in the brain. Correlations between performance in word fluency and on the Stroop test were

highest in left frontal patients. Results corroborate the hypothesis of the role of the frontal lobe in the adaptation of behavior to unusual situations, the left frontal lobe being of fundamental importance when verbal factors are involved. (French & German summaries)—*Journal abstract*.

3514. Prescott, Thomas E. & Tesauero, Patricia A. (U Denver) A method for quantification and description of clinical interactions with aurally handicapped children. *Journal of Speech & Hearing Disorders*, 1974(Aug), Vol 39(3), 235-243.—Reports on the development of a system for objectively scoring and quantifying the events of a clinician-parent-child remedial session. Scoring procedures, sequence identification, and ratio identification and calculation are described. The system can be used to provide parents and clinicians information about their interactions with the child as well as to analyze the effects of the treatment sessions on the child's performance.

3515. Rabe, Richard H. et al. (US Navy Medical Neuropsychiatric Research Unit, San Diego, CA) A model for life changes and illness research: Cross-cultural data from the Norwegian Navy. *Archives of General Psychiatry*, 1974(Aug), Vol 31(2), 172-177.—Presents a life stress and illness model based on studies of recent life changes data and near future illness reports of 1,058 17-27 yr old Norwegian Navy enlisted men. Results of these studies closely agreed with previously reported findings for 2,485 US Navy Ss. Recent life changes for both samples were assessed with the Schedule of Recent Experience; both groups also completed the Health Opinion Survey to assess perceptions of body symptoms. Both sets of data indicate that the fewer intervening variables and the less the time interval between Ss' recent life changes and their near-future illness symptoms, the higher the correlation between these 2 parameters. (32 ref)—*Journal abstract*.

3516. Rašković, Jovan. (Sibenik Medical Ctr, Neuropsychiatric Service, Yugoslavia) [Consciousness as a parameter of brain trauma.] (Ser) *Vojnosanterski Pregled*, 1974(Mar), Vol 31(2), 91-94.—Describes the phenomenology and clinical picture of disturbed consciousness during brain trauma in 427 patients. The parameters were perceptivity and reactivity. Perceptivity was taken as a separate category while reactivity was considered from several aspects, leading to a new classification of the syndrome of craniocerebral trauma. (French & Russian summaries) (18 ref)—*Journal summary*.

3517. Reitan, Ralph M. (U Washington) Psychological effects of cerebral lesions in children of early school age. In R. M. Reitan & L. A. Davison (Eds), *Clinical neuropsychology: Current status and applications*. Washington, DC: V. H. Winston & Sons, 1974. xiii, 417 p.—Presents results of a comparative psychological examination of 29 cerebrally damaged and 29 normal 5-8 yr old children. Distinctly different types of impairment were evident in the cerebrally damaged Ss when compared with normals, and psychological deficits were more marked than in adults and of a different type, although there was some indication that certain types of deficits were correctable when they developed at an early age.

3518. Rolf Jensen, Marchen. (Danish Coll for Educational Studies, Aarhus) [Comment on "Hyperkinesis: Delineation of two patterns."] (Danish) *Skolepsykologi*, 1974, Vol 11(4), 313-320.—Continues discussion of the 2 patterns of hyperkinesis postulated by S. J. Marwit and A. J. Stenner (see PA, Vol 50:1557). Some behavioral symptoms from Pattern 1 are referred to Pattern 2, and both patterns are discussed in terms corresponding to the proposed etiology: subcortical damage in Pattern 1 and cortical damage (frequently with personality deviation) in Pattern 2. Pattern 1 patients should receive medical treatment in the form of drugs that stimulate the central nervous system. For Pattern 2 patients, sedatives may complement psychological-educational treatment, taking into account secondary emotional instability and anxiety.—P. Mylov.

3519. Russek, Henry I. (New York Medical Coll, NY) **Emotional stress as a cause of coronary heart disease.** *Journal of the American College Health Association*, 1973(Dec), Vol 22(2), 120-123.—Conducted a questionnaire survey of 25,000 professional men in 20 occupational categories which demonstrated a marked gradient in the distribution of coronary disease, strikingly related to the stressfulness of occupational activity. The negative effect of the American high-fat diet combined with stress is cited. The potential for harm to the cardiovascular system by stressful patterns of living is diminished, if not nullified, by subsistence on a diet low in fat. The relationship between smoking and heart disease reflects the association between heart disease and stress, since smoking is a sign of anxiety. The need for change in patterns of schooling—which has become a traumatic experience for most students—is emphasized. (17 ref) —R. S. Albin.

3520. Salk, Lee; Grellong, Bruce A. & Dietrich, Jeanne. (New York Hosp-Cornell Medical Ctr, NY) **Sudden infant death: Normal cardiac habituation and poor autonomic control.** *New England Journal of Medicine*, 1974(Aug), Vol 291(5), 219-222.—Reports that a male infant who died of sudden-infant-death syndrome at the age of 5 wks showed more lability and poorer stabilization of the cardiac rate after stimulation at the age of 2-5 days than did normal infants. Findings suggest a dysfunction of the central mechanism for stabilizing the autonomic response, especially after stimulation. (21 ref)

3521. Scherzer, Alfred L. (Cornell U, Medical Ctr, New York) **Early diagnosis, management, and treatment of cerebral palsy.** *Rehabilitation Literature*, 1974(Jul), Vol 35(7), 194-199.—Because the major motor manifestations of cerebral palsy are not present at the time the precipitating cause occurs but rather emerge as the result of the maturation of an abnormal nervous system, it is no longer acceptable practice to await the obvious presence of motor disabilities before making a diagnosis. Developmental evaluation of the young child must consider the history of pregnancy, labor, delivery, the sequence of developing milestones, and especially the postural reflex patterns. Early identification of abnormalities will lead to a more efficient program of management and treatment, including appropriate positioning, handling, feeding, and general care. For the severely affected child, management alone may ultimately

ly be the only aspect that can be offered. Such a program requires the expertise of a team which includes physicians, social workers, educators, psychologists, and others. (31 ref)—S. L. Warren.

3522. Schulze, Heinz A. (Humboldt U, Berlin, Nerve Clinic, E Germany) [Incidence and duration of the simultaneous occurrence of ideokinetic aphasia, apraxia, and agraphia.] (Germ) *Psychiatrie, Neurologie und medizinische Psychologie*, 1974(Mar), Vol 26(3), 130-135.—Reports on inability of some patients to carry out sequential functions of speech, movement, or writing. A graphic record is presented to show relations among these syndromes for each of 42 patients over a 20-wk period. It is suggested that statistical analysis could yield an empirical basis for differential diagnosis.

3523. Silva, Alessandro. (U Cattolica del Sacro Cuore, Inst di Psicologia, Milan, Italy) [Intellectual functions and congenital infantile hypoacusis.] (Ital) *Archivio di Psicologia, Neurologia e Psichiatria*, 1974(Jan), Vol 35(1), 77-92.—Reports that congenital deafness and mutism in children indicate a lack of connection between intellectual functioning and auditory input or verbal output.

3524. Smoczyński, Stefan. (Gdansk Medical Academy, Clinic for Mental Disorders, Poland) [Psychopathology in cases of tumor in the cerebral temporal region.] (Poln) *Psychiatria Polska*, 1972(Sep), Vol 6(5), 505-510.—Studied 28 female and 23 male patients with temporal brain tumor, hospitalized in 1961-1971 in the psychiatric department of the Medical Academy in Gdańsk. Diagnoses were confirmed during surgery or post-mortem examination. In 31 patients the tumor was localized in the left temporal region, in 20 patients in the right region. All patients showed symptoms of the psychorganic syndrome. There were 17 cases of dementia, 13 of the temporal syndrome, and 8 character disorders. Behavior disorders and dementia were preceded by neuroathenic complaints. The clinical pattern of these abnormalities seems to depend on the character of the morbid process and on the severity of the damage to the central nervous system. (Russian summary) (17 ref) —English summary.

3525. Spudis, Edward V. & Griffin, Albert. (Forsyth Memorial Hosp, Winston-Salem, NC) **Adams-Stokes attacks associated with hysteria.** *JAMA: Journal of the American Medical Association*, 1974(Sep), Vol 229(12), 1636.—Reports that a serious case of heart disease in a 55-yr-old woman went undetected because of a confusing mixture of psychogenic convulsions and Adams-Stokes attacks. The patient's reasons for producing caricatures of grand mal attacks are unclear. However, these intense convulsions may also have caused some of the attacks of the heart block.

3526. Sterman, M. B.; Macdonald, L. R. & Stone, R. K. (U California, Los Angeles) **Biofeedback training of the sensorimotor electroencephalogram rhythm in man: Effects on epilepsy.** *Epilepsia*, 1974(Sep), Vol 15(3), 395-416.—Previous studies with cats demonstrated a discrete 12-16 Hz rhythm in sensorimotor cortex (SMR), present only during absence of movement, that could be operantly conditioned. Trained cats were resistant to drug-induced seizures. In the present study similar biofeedback training procedures were employed with 4 epileptic and 4 nonepileptic human Ss, utilizing lights,

tones, and slides. Initially SMR activity was detected only at low voltage by tuned filters. Biofeedback training sessions resulted in a significant increase in this activity after 2-3 mo. Learned SMR responses in nonepileptic Ss were trains of pure or polyrhythmic 12-16 Hz activity at 20-25  $\mu$ V over central and frontal areas. Although epileptic Ss failed to develop the enhanced SMR amplitude, they did demonstrate increased occurrence of this frequency. Training in 4 epileptics who previously were not controlled by chemotherapy was accompanied by a significant reduction of EEG and clinical epileptic manifestations, as indicated by sequential power spectral analysis, clinical EEG records, and seizure logs. Tonic-clonic and myoclonic seizures were most markedly reduced. (French, Spanish, & German summaries) (23 ref)—*Journal summary*.

3527. Straker, Norman & Tamerin, John. (Mt Sinai School of Medicine, City U New York) **Aggression and childhood asthma: A study in a natural setting.** *Journal of Psychosomatic Research*, 1974(Apr), Vol 18(2), 131-135.—Studied 28 boys and 14 girls 5-16 yrs old (mean age 11 yrs) with a diagnosis of chronic perennial asthma. 2 methods were used to assess the severity of symptomatology. A manifest aggression score was also derived for each S by utilizing a modification of the Teacher's Rating Scale. Results reveal a statistically significant negative relationship between the severity of asthmatic symptomatology and aggressive behavioral expression.—W. G. Shipman.

3528. Tait, Perla. (U North Dakota) **A descriptive analysis of the play of young blind children.** *Education of the Visually Handicapped*, 1972(Mar), Vol 4(1), 12-15.—Observed seeing and blind children in a controlled play situation to determine whether the play of the 2 groups differed. The blind children had difficulty in orienting themselves spatially. Seeing children assigned more roles to play objects than blind children. Blind children asked more questions than sighted children. This is interpreted as an attempt by blind children to open avenues of communication. Specific recommendations are made concerning the play of blind children.—C. L. Nicholson.

3529. Tweedie, David. (Gallaudet Coll) **Observing the communication behavior of deaf-blind children.** *American Annals of the Deaf*, 1974(Jun), Vol 119(3), 342-347.—The use of observational techniques for rating the communication of multihandicapped children was assessed by raters viewing videotaped behavioral situations. 5 groups of 15 raters each participated: professionals working with deaf-blind populations, speech pathologists, speech pathology students (Master's level), speech pathology students (Bachelor's level), and undergraduate students. After viewing the videotape, each rater completed the Telediagnostic Protocol for each of 8 behavioral situations. Results indicate that the training and experience of the observer did not show significant differences on the rating instrument. (53 ref)—C. K. Miller.

3530. Van Imschoot, K.; Liesse, M.; Mertens, C. & Lauwers, P. (Catholic U Louvain, Belgium) **[Psychological characteristics and physiological reactions to stress of normal and coronary subjects: II.]** (Fren) *Journal of Psychosomatic Research*, 1974(Apr), Vol 18(2), 75-87.

—Compared the physiological reactions to stress of 40 male coronary patients and 40 normal males. Of each group of 40 Ss, 20 accomplished mental or physical tasks under stress and 20 under normal conditions. Various physiological measures were taken (EKG, respiratory quotient, O<sub>2</sub> intake, and blood count), in 3 phases of the experiment: (a) while Ss were at rest, (b) after mental effort, and (c) after physical effort. One set of reactions (blood pressure, heart rate, respiratory rate, and biological parameters) differentiated the normal stressed from normal nonstressed Ss, thus indicating good adaptation, while another set (O<sub>2</sub> intake, CO<sub>2</sub> output, and respiratory quotient) differentiated the coronary stressed Ss from the unstressed, pointing to exhaustion of the organism. (38 ref)—W. G. Shipman.

3531. Van Thiel, David H. & Lester, Roger. (U Pittsburgh) **Sex and alcohol.** *New England Journal of Medicine*, 1974(Aug), Vol 291(5), 251-253.—Discusses data concerning the possible causes and mechanisms of the gross feminization observed in male alcoholics before the onset of Laennec's cirrhosis. Data suggest that alcohol ingestion permanently alters the patient's mechanisms for the biosynthesis and excretion of steroid hormones, and produces irreversible testicular germ-cell injury. (26 ref)

3532. Walther, Rolf. (Psychotherapeutic Clinic, Limbach, E Germany) **[Derivations of basic psychic properties: The depressive syndrome.]** (Germ) *Psychiatrie, Neurologie und medizinische Psychologie*, 1974(Feb), Vol 26(2), 70-77.—Relates depression syndrome to disturbances in biological rhythms such as menstruation. (32 ref)

3533. Ward, J. (U Manchester, England) **The investigation of motor control in a five year old hemiplegic child: Results of a mini experiment.** *Association of Educational Psychologists Journal & News Letter*, 1971(Fal), Vol 2(10), 33-35.—Investigated aspects of motor control in a 5-yr-old hemiplegic child. The task required the S to draw crosses within outline circles placed in various positions in his visual field. It was found that in addition to position in visual field, the method of holding the pencil (penholder or palm grasp) and whether or not the pencil was weighted were important components in S's success.—*Journal summary*.

3534. Weil, Annemarie P. (Child Development Ctr, New York, NY) **Children with minimal brain dysfunction: Diagnostic and therapeutic considerations.** *Psychosocial Process*, 1970, Vol 1(2), 80-97.—Reviews the literature on minimal brain dysfunction in children. Typically the minimally impaired child is hyperkinetic and displays a constant desire to contact the environment. However, definitive diagnosis requires (a) a complete medical history, (b) psychological testing, and (c) a neurological examination. In terms of therapy, turning down the life and environment of a child with minimal brain dysfunction will limit his impulsiveness and foster his capacity to delay, both of which are important for ego growth and for maintaining or establishing a good self-image. Specific and careful training will help improve reality testing, secondary

process thinking, and pleasure in functioning and mastery, thus fostering neutralization. (31 ref)—J. M. Kleinman.

3535. Yamada, Hiroaki. (Kyushu U Hosp, Central Clinical Lab, Fukuoka, Japan) [A familial narcolepsy.] (Japn) *Kyushu Neuro-psychiatry*, 1971(Dec), Vol 17(3-4), 129-136.—Reports the results of medical examinations and EEG analyses of a family of 8: a mother (85-yr-old narcoleptic), 4 sons (60- and 46-yr-old narcoleptics and 56- and 53-yr-old non-narcoleptics) and 2 daughters (51- and 49-yr-old non-narcoleptics). A slight difference in EEG pattern between narcoleptic and non-narcoleptic siblings was found (i.e., 22.7% and 21.2% in a waking pattern, 66.4% and 60.5% in a drowsy pattern, and 10.9% and 18.3% in a sleep pattern, respectively). The occurrence of a drowsy or sleep pattern in a resting EEG in non-narcoleptic siblings resembled that of narcoleptic members. The EEGs of the non-narcoleptics showed a trend toward disturbances in the wakefulness pattern similar to those of narcoleptic members. All family members except 1 son were hypertensive, but narcolepsy was not related to the hypertension. (English summary) (19 ref)—S. Ashida.

3536. Zarit, Steven H. & Kahn, Robert L. (City Coll, City U New York) **Impairment and adaptation in chronic disabilities: Spatial inattention.** *Journal of Nervous & Mental Disease*, 1974(Jul), Vol 159(1), 63-72.—The phenomenon of spatial inattention was measured quantitatively in 89 38-84 yr old persons with chronic brain dysfunction and was observed as long as several years after the onset of the disorder. All Ss completed a battery of tests assessing the occurrence and extent of inattention, deficits of sensory, motor, visual field, and mental functions, and attitudes toward illness and affective state. Differences due to side of lesion were found to be artifacts of sampling and of greater severity of deficits of testable, nondominant side Ss. Although visual field impairments were a significant factor, there were many cases of inattention and no apparent visual deficit. The amount of inattention was related to the total severity of all deficits, rather than to 1 specific dysfunction, and also more pronounced in persons who were withdrawn or who denied their illness and impairments. (28 ref)—*Journal abstract*.

3537. Zienkiewicz, Hanna. (Wroclaw Medical Academy, Psychiatric Clinic, Poland) [Suprarenal reserve in schizophrenia patients on the basis of a synacthen test.] (Poln) *Psychiatria Polska*, 1972(Sep), Vol 6(5), 511-517.—Investigated the functional suprarenal cortex reserve (SCR) in 30 chronic schizophrenic patients. A synacthen (tetracosactide) test was used. The plasma cortisol level was determined by the fluorimetric method of J. Daly and J. Spencer Peet. The mean value of the initial plasma cortisol level in these Ss did not differ from that of a control group of 10 Ss. Despite a slight decrease, the mean value of the functional SCR was within the dispersion limits of the control group. Detailed analysis of the material showed that the functional SCR was lower in 9 of the 30 Ss. The usefulness of the synacthen test in investigations of the SCR, both under clinical conditions and in routine examinations, is stressed. (Russian summary) (21 ref)—*English summary*.

## TREATMENT AND PREVENTION

3538. Christensen, J. K. (Glostrup State Hosp, Copenhagen, Denmark) **A 5-yr follow-up study of male schizophrenics: Evaluation of factors influencing success and failure in the community.** *Acta Psychiatrica Scandinavica*, 1974, Vol 50(1), 60-72.—A 5-yr follow-up of 119 discharged schizophrenic men identified 53 patients who were not readmitted (arbitrarily defined as successes). Out of 66 failures, 47 were readmitted and discharged and 19 were readmitted and not discharged. Successes were older at discharge, had a longer duration of illness and a longer stay in hospital, lived to a greater extent under sheltered conditions, and had a better employment record. There were fewer chronic successes, and the failures had had more readmissions before the 5-yr follow-up period. More successes than failures had not attended outpatient control before or after the last admission. More failures left the hospital against medical advice. The successes were less accepted by their relatives and had less of an awareness of being mentally ill. Aggravation of psychotic symptoms because of the patients' omission to take prescribed drugs was the most important cause of readmissions. At the time of follow-up, more successes were severely disturbed. All patients showed increasing social and familial problems during the follow-up period. Variables that appear to be important in preventing readmissions and making life easier for the patients and their families in the community are discussed. The need for more extensive aftercare facilities and a closer contact with relatives is emphasized. (19 ref)—*Journal abstract*.

3539. Dreger, Ralph M. & Johnson, William E. (Louisiana State U, Baton Rouge) **Characteristics of volunteers, nonvolunteers, and no shows in a clinical follow-up.** *Journal of Consulting & Clinical Psychology*, 1974(Oct), Vol 42(5), 746-747.—Tested differences on the 16 Personality Factor Questionnaire (16 PF) and the MMPI between those who accepted and kept clinic appointments (29 volunteers), those who refused appointments (14 nonvolunteers), and those who accepted but did not keep appointments (16 no shows). Only the Q<sub>1</sub> scale of the 16 PF distinguished volunteers from nonvolunteers, with volunteers significantly less anxious. When combined with lower anxiety, however, higher sociability and self-esteem significantly differentiated volunteers from nonvolunteers.

3540. Glennon, Claire A. & Nason, Doris E. (Connecticut Public Schools, Coventry) **Managing the behavior of the hyperkinetic child: What research says.** *Reading Teacher*, 1974(May), Vol 27(8), 815-824.—Discusses hyperkinesis in terms of its characteristics, its educational management, its medical management, etc. The hyperkinetic is the source of considerable concern to teachers, the public, and the news media. Much gross misinformation concerning the hyperkinetic syndrome has been given out, and it is a great help to the family and teacher of the hyperkinetic child to realize that the child's difficulties do not arise from simple, willful disobedience, or a "doubledip" in original sin. The need for parents and professionals to know more about the problem of hyperkinesis persists.—P. D. Leedy.

- 455

—Reviews the current antipsychiatry movement in Great Britain, Italy, and France, especially as seen in the 1970 French Mental Hygiene League Annual Convention. One trend is the development of a social psychiatry based on phenomenological psychiatry.

3551. Oelrich, Margaret. (City of Hope Medical Ctr, Duarte, CA) **The patient with a fatal illness.** *American Journal of Occupational Therapy*, 1974(Aug), Vol 28(7), 429-434.—Discusses concepts that may assist the occupational therapist to understand grief, mourning, and death. Suggestions are made as to how the therapist can help the patient and members of his family.

3552. Rubottom, R. L. **The differences and similarities of Zen, autogenic training, hypnosis and acupuncture.** *Journal of the American Institute of Hypnosis*, 1973(Sep), Vol 14(5), 226-227.—Suggests that in all forms of the healing arts (e.g., Zen, formal hypnosis, acupuncture, and conventional Western medicine) there is a certain element of hypnosis or suggestibility involved, in that the patient believes that he will become better through these procedures. The effectiveness of acupuncture, however, differs significantly from the other modalities, although exactly how it does has not yet been completely explained.

3553. Sloboda, Sharon B. (Catholic U of America, School of Nursing) **The children of alcoholics: A neglected problem.** *Hospital & Community Psychiatry*, 1974(Sep), Vol 25(9), 605-606.—Advocates the inclusion of children of alcoholic parents in treatment programs, since these children frequently suffer serious emotional damage as a result of problems related to a parent's drinking. Some of the effects observed among children of alcoholics are discussed.

3554. Spitzer, Robert L.; Endicott, Jean; Cohen, Jacob & Fleiss, Joseph L. (New York State Psychiatric Inst, New York) **Constraints on the validity of computer diagnosis.** *Archives of General Psychiatry*, 1974(Aug), Vol 31(2), 197-203.—Issues in the constraints on the validity of computerized psychiatric diagnosis are illustrated by the analysis of diagnoses produced by treating clinicians, expert diagnosticians, and the DIAGNO III computer diagnostic system. Results indicate modest agreement between the computerized diagnoses and both clinicians and experts, and not much better agreement between the experts and between the treating clinicians. The main constraint on the validity of computerized diagnoses is not in any inherent limitation on computer processing but rather in the limitations of the current diagnostic system itself. It is concluded that improvements in computer diagnosis await improvements in the diagnostic system, along the lines of simplification, explicit criteria, and limitation of the categories to those conditions for which validity evidence exists. (18 ref) —*Journal abstract.*

3555. Steiner, Betty W.; Zajac, A. S. & Mohr, J. W. (Clarke Inst of Psychiatry, Toronto, Ontario, Canada) **A gender identity project: The organization of a multidisciplinary study.** *Canadian Psychiatric Association Journal*, 1974(Feb), Vol 19(1), 7-12.—Describes a project to study problems of gender identity (especially transsexualism) and to offer treatment when appropriate which was established at the University of Toronto in 1968. Methods used by the project—which took a multidisciplinary

approach—are discussed, and results for 88 patients are presented. (French summary) (23 ref)

3556. Trostorf, Sieglind v. (Humboldt U Berlin, Div of Medicine, E Germany) **[On past-dreaming (associated dreaming).]** (Germ) *Psychiatrie, Neurologie und medizinische Psychologie*, 1974(Mar), Vol 26(3), 183-185.—Analyzes a dream according to K. Leonhard's interpretative method.

3557. Weisman, Gaby. **A psycho-social model for limiting mental reaction during stress.** *Israel Annals of Psychiatry & Related Disciplines*, 1974(Jun), Vol 12(2), 161-167.—Presents a model of personal and situational needs arising from stress situations in the armed forces. The main responsibility for fulfilling these needs and preventing the occurrence of stressful situations lies with the commanding officer because of his proximity to the soldiers. The model, which suggests levels of intervention appropriate for specific situations and allows for the hierarchical structure of the military, is focused at the unit rather than at the individual level. Suggestions for training commanding officers in principles of mental health and therapeutic procedures are presented.—*L. Gorsey.*

3558. Welner, Amos; Liss, Jay L. & Robbins, Eli. (Washington U, Medical School) **A systematic approach for making a psychiatric diagnosis.** *Archives of General Psychiatry*, 1974(Aug), Vol 31(2), 193-196.—Suggests that a systematic approach, using diagnostic classification by criteria, enhances psychiatric research that, in turn, leads to an increase in accuracy of that classification. Also, using diagnostic criteria to arrive at a psychiatric diagnosis serves as a safeguard against bias in diagnostic impression when a major psychiatric symptom dominates the clinical picture. Some recent studies are described and it is concluded that (a) most patients whose conditions were undiagnosed by clinical impression were diagnosed when systematically studied, using criteria for diagnostic classification; and (b) with the exception of antisocial personality, personality disorders could not be classified by criteria; rather, most of these patients met the criteria for 1 or more psychiatric disorders. (28 ref)—*Journal abstract.*

3559. Whol, Theodore H. (Cincinnati Ctr for Developmental Disorders, OH) **Thorough behavioral analysis and description: Its relationship to social planning.** *Mental Retardation*, 1974(Aug), Vol 12(4), 21-23.—Presents an argument for the utility and necessity of thorough behavioral analysis and description using W. Wolfensberger's (1965) "5 embarrassments in the diagnostic process" as a point of departure. It is noted that an interdisciplinary approach goes far beyond mere descriptive labeling of clinical signs and symptoms. Nosology is eschewed for comprehensive descriptive statements permitting effective and specific treatment. It is considered that, in order to program for social competency, certain priorities must be determined, as well as what aspect of a particular child's behaviors is in most need of attention and most amenable to change.—*Journal abstract.*

#### Psychotherapy & Psychotherapeutic Processes

3560. Booth, D. A. (U Birmingham, England) **Food intake compensation for increase or decrease in the**

**protein content of the diet.** *Behavioral Biology*, 1974(Sep), Vol 12(1), 31-40.—Conducted an experiment with 22 male Sprague-Dawley albino rats in which daily protein intakes compensated rather precisely for current over- or under-supply of amino acids to provide energy and protein, when feeding was not dominated by energy need, extremes of palatability, or inappropriate selection habits. Interactions between protein-induced satiety and acquired protein appetites may possibly be sufficient to explain the observed compensatory behavior. Results confirm that control of food intake can play the primary role in regulation of nitrogen exchange as well as in the regulation of energy exchange in the rat. (31 ref)  
—*Journal abstract.*

3561. ———. **Gestalt therapy reading list: An annotated bibliography.** *Counseling Psychologist*, 1974, Vol 4(4), 60-63.—Presents an annotated listing of 12 primary references, 22 books, and 71 articles.

3562. ———. **Therapeutic art programs around the world: X. Collage in the treatment of disturbed adolescents.** *American Journal of Art Therapy*, 1973(Oct), Vol 13(1), 59-62.—Describes the therapeutic use of collage. This medium enables the disturbed adolescent patient to achieve a paste-up autobiography without being limited by the lack of specific artistic skills.

3563. **Abraham, Ada.** (Hebrew U, Jerusalem, Israel) **Death and psychodrama.** *Group Psychotherapy & Psychodrama*, 1972, Vol 25(3), 84-92.—Discusses the application of psychodrama methods to reinforce man's ability to face death. Different psychodrama methods are described for use in cases where a problematic attitude toward death is accompanied by symptoms of personality disturbances and in cases where a normal personality has determined a certain attitude toward death in the general framework of its integrative endeavors. It is concluded that psychodrama can help find ways of releasing the energy which is invested by the individual and the group in mechanisms of defense against death. Case examples are provided. (17 ref)—*R. S. Albin.*

3564. **Alpert, Augusta.** (Child Development Ctr, New York, NY) **Reversibility of pathological fixations associated with maternal deprivation in infancy.** *Psychosocial Process*, 1970, Vol 1(2), 14-28.—Reviews the method of Corrective Object Relations (COR), a form of therapy which attempts to reverse the pathology of children suffering from early maternal deprivation. COR therapy is based on need, satisfaction and gratification. The principal criteria for progress are the child's growth in object relations beyond need satisfaction and in reality testing. The 1st step in COR is to establish an exclusive, need-satisfying relationship between the child and the special teacher, which induces regression to the point of traumatic fixation. Early in treatment the special teacher follows and encourages regressive cues; later the teacher encourages growth cues and uses the child's verbalizations and play to assist reality testing. 3 cases are presented. (38 ref)—*J. M. Kleinman.*

3565. **Anderson, Frances E. & Landgarten, Helen.** (Illinois State U) **Survey on the status of art therapy in the Midwest and Southern California.** *American Journal of Art Therapy*, 1974(Jan), Vol 13(2), 118-122.—Discusses art therapy programs now in existence and planned

for the future, and types of programs for training art therapists.

3566. **Armstrong, Renate G. & Schur, David.** (VA Hosp, Northport, NY) **Warm-up techniques in a married couples group.** *Group Psychotherapy & Psychodrama*, 1972, Vol 25(3), 93-101.—Defines the warm-up technique as the process of getting an individual or group to loosen up and become ready to actively participate in a session of psychodrama. The use of this method with a group of psychiatric patients in a Veterans Administration hospital and their spouses is described. Various participation-enhancing techniques are cited, and the use of tape recordings, rating scales, and sociograms. Case examples are provided. The progress of the group from warm-up techniques to participation in actual psychodramas is traced.—*R. S. Albin.*

3567. **Baldwin, Bruce A.** (U North Carolina, Medical School, Chapel Hill) **Self-disclosure and expectations for psychotherapy in repressors and sensitizers.** *Journal of Counseling Psychology*, 1974, Vol 21(5), 455-456.—Identified 2 groups of 49 university students as repressors and sensitizers based on scores on Byrnes's Repression-Sensitization Scale. Ss completed the Jourard Self-Disclosure Questionnaire and a Likert-type scale rating dimensions of psychotherapy to assess effects of defensive orientation on expectations for a psychotherapy relationship. Repressors indicated significantly more willingness than sensitizers to self-disclose during the 1st 4 hrs of therapy. Repressors expected more planned than spontaneous activity by the therapist, felt therapist personality less important than sensitizers in facilitating change, and rated themselves significantly less likely than sensitizers to enter psychotherapy in the future. Results are discussed within the framework of repressing and sensitizing defensive styles. *Journal abstract*

3568. **Bauersfeld, K. H.** [Existential analysis in child psychiatry.] (Germ) *Zeitschrift für Klinische Psychologie und Psychotherapie*, 1972, Vol 20(4), 348-356. [Discusses L. Binswanger's existential analysis and its possible use in psychotherapy with children and juveniles. The case of a 4½-yr-old boy who lost his father is presented as an example: the death of the father, as an event of exterior life, became a determinant happening and led the child to abandon his childhood image of the world. (English summary)]—*T. Fisher.*

3569. **Beckett, John A.** (U New Hampshire, Whittemore School of Business & Economics) **General systems theory, psychiatry and psychotherapy.** *International Journal of Group Psychotherapy*, 1973(Jul), Vol 23(3), 292-305.—Presents a state of the art analysis of general systems theory and its meaning for psychiatry and psychotherapy. The historical background is reviewed. A critique is presented regarding 3 aspects of the theory (the concept of systems, the idea of holism, and the paradigm of general systems). In psychiatry, general systems theory is concerned with the interface between psychiatry and anthropology. However, the culture in which individuals exist is only 1 class of input into psychiatry. The physical and biological worlds must also be considered. (16 ref)—*R. S. Albin.*

3570. **Berg, Albert J.** **Psychoanalysis versus hypnoanalysis.** *Journal of the American Institute of Hypnosis*, 1973(Sep), Vol 14(5), 239-241.—Discusses the

relative effectiveness of psychoanalysis and hypnotherapy in curing mental illness. Hypnoanalysis as developed by W. J. Bryan is described, and 3 cases of psychiatric patients for whom the psychoanalytic prognosis was not good but who did respond adequately to hypnoanalysis are reported.

3571. Blanck, Rubin. Countertransference in treatment of the borderline patient. *Clinical Social Work Journal*, 1973(Sum), Vol 1(2), 110-117.—Points out the need for psychotherapists to take a careful inventory of themselves while working with the borderline patient. A clinical vignette is presented to clarify the importance of therapist restraint, the key to handling countertransference.

3572. Bomba, Jacek. (Cracow Medical Academy, Psychiatric Clinic, Poland) [Transsexualism: Problems in treatment.] (Polh) *Psychiatria Polska*, 1972(Sep), Vol 6(5), 569-575.—Presents various views expressed in the literature on the etiopathogenesis and treatment of transsexualism. 7 transsexuals received psychotherapy aiming at improving self-concept and relationship to self. 3 were markedly improved in regard to social readaptation and gave up the desire for sexual transformation. 2 applied for formal change of name in accordance with the choice of gender identity. (Russian summary) (45 ref) —English summary.

3573. Bommert, Hanko et al. (U Münster, Psychological Inst, W Germany) [Empirical control of the effects and processes of client-centered psychotherapy in psychoneurotic clients.] (Germ) *Zeitschrift für Klinische Psychologie*, 1972, Vol 1(1), 48-63.—Studied the effects of client-centered therapy on 44 15-40 yr old psychoneurotic patients (33 males and 11 females) of IQ 90-128. Ss were randomly divided into a psychotherapy group of 22 and a no-therapy control group of 22; the groups differed only insignificantly in pretests administered by Es. Ss of the therapy group received an average of 6 therapy sessions in 9 wks, administered by 13 same-sex therapists. Controls received no therapy. After 9 wks both groups received psychodiagnostic tests to measure attained changes: the Minnesota Multiphasic Personality Inventory, Eysenck Personality Inventory (Form B), Bastine D scale, Horn Test, and the Strupp and Barrett-Lennard questionnaires. The data are tabulated and analyzed. Corrected regression values show that Ss of the therapy group—even allowing for spontaneous remissions—achieved significant positive changes in essential psychic dimensions. The process variables of therapists and clients correlated in several respects with the changed test results obtained by the Ss. (English summary) (22 ref)—T. Fisher.

3574. Brandsma, Jeffrey M. & Ludwig, Arnold M. (U Kentucky, Medical School) A case of multiple personality: Diagnosis and therapy. *International Journal of Clinical & Experimental Hypnosis*, 1974(Jul), Vol 22(3), 216-233.—Describes a case of multiple (4) personality and the psychological tests of ability, memory, and personality which were administered. These data lead to a discussion of the practical and theoretical problems of diagnosis. It is contended that dual or multiple personalities should be considered a unique category apart from the traditional concepts of hysteria or schizophrenia. A therapeutic "fusion" is described and evaluated. (Ger-

man, French & Spanish summaries) (18 ref)—*Journal abstract*.

3575. Bucher, Bradley D. (U Western Ontario, London, Canada) Problems and prospects for psychotherapy research design. In O. I. Lovaas & B. D. Bucher (Eds), *Perspectives in behavior modification with deviant children*. Englewood Cliffs, NJ: Prentice-Hall, 1974, xiii, 562 p.—Cites the problems inherent in evaluating the effectiveness of psychotherapeutic techniques, notably that the complexity of the treatment process tends to mask the phenomena that should be investigated. Viable research procedures—the control-group design and within-S designs—are discussed, and the problem in control-group design of the replicability of treatment results over a definable class of clients is examined. (21 ref)

3576. Buckley, Peter & Sander, Fred. (Albert Einstein Coll of Medicine, Yeshiva U) The history of psychiatry from the patient's viewpoint. *American Journal of Psychiatry*, 1974(Oct), Vol 131(10), 1147-1150.—Describes a course in the history of psychiatry in which patients' autobiographies are used to illustrate different eras and approaches to the treatment of the mentally ill. This approach is useful because it highlights recurrent historical themes and provides a perspective on the present transitional state of psychiatry in addition to expressing the viewpoints of certain subordinate groups of psychiatric patients (e.g., women and blacks). Several books used in the course are also discussed. (33 ref) —*Journal abstract*.

3577. Chiles, John A. (U Washington, Medical School) A practical therapeutic use of the telephone. *American Journal of Psychiatry*, 1974(Sep), Vol 131(9), 1030-1031.—Notes that the telephone in psychotherapy is frequently used as an emotional safety value. Its use as a planned, often daily, part of therapy in which positive behavior is reinforced is described. 2 cases are presented, together with a discussion of the technique involved.

3578. DeMuth Berg, Constance. (Northwest Community Unit Schools, Sciota, IL) Helping a child deal with a matter of life and death. *American Journal of Art Therapy*, 1973(Oct), Vol 13(1), 39-51.—Presents the case of a 5-yr-old boy and how art therapy enabled him to cope with problems caused by his mother's death. Speculations are offered concerning the psychological meanings of the colors used by the child in his paintings, attempting to relate colors to specific psychological states.

3579. Dewdney, Selwyn. (Royal Ontario Museum, Toronto, Canada) Elda's art therapy in the context of a quarter century of psychiatric treatment: I. *American Journal of Art Therapy*, 1973(Oct), Vol 13(1), 3-21.—Presents the 1st of 2 articles reviewing 25 yrs of art therapy with a female patient. The intensive treatments are described, the patient's development during therapy is examined, and the effects of the various therapies she has thus far experienced are discussed.

3580. Dewdney, Selwyn. Elda's art therapy in the context of a quarter century of psychiatric treatment. *American Journal of Art Therapy*, 1974(Jan), Vol 13(2), 123-140.—Presents the 2nd of 2 articles describing 25 yrs of art therapy with a female patient.

3581. Emerson, Patricia & Smith, Edward W. (Georgia State U) **Contributions of Gestalt psychology to Gestalt therapy.** *Counseling Psychologist*, 1974, Vol 4(4), 8-12.

—A principle of Gestalt psychology is to stay in the present as opposed to emphasizing the past. Gestalt psychology states that a whole is different from its assembled parts, and deals with "wholes." Unconscious processes are rejected. It is suggested that Gestalt psychology has been absorbed into general psychology and Gestalt therapy may become a part of traditional psychotherapy, thus losing its distinct flavor.—H. Silverman.

3582. Fabbri, Remo & Dy, Antonio J. (Yale U) **Hypnotic treatment of trichotillomania: Two cases.** *International Journal of Clinical & Experimental Hypnosis*, 1974(Jul), Vol 22(3), 210-215.—Presents 2 case histories of a 21-yr-old white male and female with trichotillomania (compulsion to pull out one's hair), and discusses the use of hypnotic techniques in the management of this problem. Positive results are reported, and some of the possible theoretical explanations for the success of these techniques are considered. (German, French & Spanish summaries)

3583. Fagan, Joen et al. (Georgia State U) **Critical incidents in the empty chair.** *Counseling Psychologist*, 1974, Vol 4(4), 33-42.—Discusses "the empty chair" approach as one of the most effective Gestalt techniques. There are 2 seats, one occupied by the patient and the other representing the presence of a significant person in his environment, with whom he carries on a dialogue that expresses and resolves hidden conflicts. The patient relates to both places. The method looks easy, but the therapist should be prepared for the expression of powerful feelings and must provide emotional support in the event of a crisis. 3 transcripts of "empty chair" sessions are included.—H. Silverman.

3584. Fagan, Joen. (Georgia State U) **Three sessions with Iris.** *Counseling Psychologist*, 1974, Vol 4(4), 42-60.—Presents transcripts of 3 sessions with a resistant female client who had no prior experience with Gestalt therapy, to illustrate the method of "training" a client "into" Gestalt procedures. In a follow-up contact the patient indicated that the therapy had been beneficial, helpful, and meaningful.

3585. Gaddini, Renata. (U Rome, Italy) **Early psychosomatic symptom and the tendency towards integration.** *Psychotherapy & Psychosomatics*, 1974, Vol 23(1-6), 26-33.—Argues that each time psychosomatic symptoms appear in a child, something has adversely affected the use he is making of the object. The focal point in treating these cases has to be the integration between mother and infant, rather than infant or mother exclusively, because the child's early development is based on interaction. The mother-child system safeguards the narcissistic needs of the child and may gradually, through a facilitating environment, bring out narcissism towards the external environment. It is concluded that focus should be placed on this early facilitating or nonfacilitating environment in order to produce rational and preventive interventions in psychosomatic medicine.—*Journal abstract.*

3586. Garai, Josef E. (Pratt Inst) **The use of painting to resolve an artist's identity conflicts.** *American Journal*

*of Art Therapy*, 1974(Jan), Vol 13(2), 151-164.—Discusses esthetic and psychological conflicts in the work of a professional art student who was involved for 4 yrs in both an art therapy group and regular therapy.

3587. Gelso, Charles J. (U Maryland, Counseling Ctr) **Effects of recording on counselors and clients.** *Counselor Education & Supervision*, 1974(Sep), Vol 14(1), 5-12.—A review of early research on the effects of audio recording on counselors and clients found no adverse effects, particularly on clients. This research fostered a set of beliefs about recording which is now being extrapolated to the area of video observation. Recent research, however, does suggest that audio and, in particular, video recording has an inhibitory effect on clients and counselors. The nature of these effects on clients appears to depend on several client characteristics (e.g., the type of presenting problem). Although recording is not as inhibitory as clients expect it to be, counselors tend not to be sensitive to the inhibiting effects that do occur in their clients. (28 ref)—*Journal abstract.*

3588. Greenspan, Stanley I. & Mannino, Fortune V. (NIMH, Mental Health Study Ctr, Adelphi, MD) **A model for brief intervention with couples based on projective identification.** *American Journal of Psychiatry*, 1974(Oct), Vol 131(10), 1103-1106.—Considers that projective identification has been described by many Os from different perspectives in a variety of settings, but has been most frequently associated with rather disturbed families as an interpersonal mechanism involved in distorted perceptions, identifications, and communication. How this mechanism manifests itself in couples with relatively intact, although neurotic, personality organizations is described, along with how it interferes with their capacity to resolve problems and experience joint interpersonal growth. It is suggested that a short-term treatment approach with such couples may usefully organize itself around the identification and correction of the perceptual distortions involved in projective identification.—*Journal abstract.*

3589. Haas, Wolfgang & Haas, Monika. (Humboldt U Berlin, Nerve Clinic, E Germany) **[A cybernetic model of the development and treatment of neuroses.]** (Germ) *Psychiatrie, Neurologie und medizinische Psychologie*, 1974(Mar), Vol 26(3), 151-154.—Presents a simple block diagram representing a cybernetic model of neuroses. Neurotic reactions and developments are regarded as expressing a relative stabilization of behavioral control outside physiological limits. Return of the system to its physiological limits, accompanied by internal limiting values, guarantees lasting therapeutic results.

3590. Hanegbi, Rivka; Krasilowsky, David & Feuerstein, Reuven. (Hadassah-Wizco-Canada Child Guidance Clinic, Jerusalem, Israel) **The corrective object relations (COR) theory and the treatment group technique (TGT): A common theoretical framework for two different techniques.** *Psychosocial Process*, 1970, Vol 1(2), 29-46.—Describes TGT and discusses its similarities with COR. Both treatments attempt to reverse the pathology resulting from early maternal deprivation, COR in nursery school and kindergarten children and TGT in preadolescents and adolescents. TGT takes place within a youth village of normally functioning adoles-

cents and seeks to satisfy 2 important needs of the disturbed adolescent: the need to be protected and accepted and the need to preserve contact with the normal peer group. In contrast to COR, in which successful organization of the peer group is dependent upon the adult figure, in TGT the role of the adult is less decisive than that of peers in establishing the social unit of healthy interrelated functions. Both COR and TGT have evolved 4 strategies as basic in dealing with disturbed individuals: unconditioned acceptance, reduction of anxiety, induced regression, and planned and controlled relationships with the normal peer group. A case history illustrates TGT.—*J. M. Kleinman.*

3591. Heilbrun, Alfred B. (Emory U) **Improved detection of the early defecting counseling client.** *Journal of Consulting & Clinical Psychology*, 1974(Oct), Vol 42(5), 633-638.—Research into the factors predisposing clients to terminate prematurely from counseling often requires the ability to measure and predict defection or continuation, the readiness variable. This study attempted to improve upon the Counseling Readiness Scales by the empirical development of correction keys using the remaining items from the Adjective Check List. Ss were 186 female and 243 male undergraduate counseling clients. This effort was successful as far as improved discrimination between both male and female true negatives (clients predicted to drop who actually drop) and false negatives (clients predicted to drop who actually stay). However, similar efforts to improve the discrimination between true positives (clients predicted to stay who actually stay) and false positives (clients predicted to stay who actually drop) were unsuccessful.—*Journal abstract.*

3592. Hertz, Dan G. (Hebrew U—Hadassah Medical School, Jerusalem, Israel) **Problems and challenges of consultation psychiatry in gynecology and obstetrics.** *Psychotherapy & Psychosomatics*, 1974, Vol 23(1-6), 67-76.—Reviews clinical experiences of liaison psychiatry and emphasizes specific reactions in the consultee in a survey of 23 gynecologists and obstetricians in a general teaching hospital. Long-term cooperation between gynecologist and psychiatrist in the ward setting and in special integrated clinics is urged, and the concept of clinical duality—the function of the gynecologist in his alternating active and passive therapeutic role—is stressed. (30 ref)

3593. Hollander, Carl & Moore, Charles. **Rationale and guidelines for the combined use of psychodrama and videotape self-confrontation.** *Group Psychotherapy & Psychodrama*, 1972, Vol 25(3), 75-83.—Recommends the use of videotape self-confrontation (VSC) in conjunction with psychodrama. In this technique the S's psychodrama performance is recorded on tape and played back, enabling him to become his own audience and observe his behavior as a spectator, which is impossible during the acting. VSC is regarded as the best available form of behavioral feedback. Comments and suggestions regarding the best way to use VSC with psychodrama are offered. The S should portray himself. Immediate playback may assist in integrating the psychodrama and stimulate self-disclosure; postsession playback may be preferable, however, in some circumstances. The therapist's need for flexibility is emphasized. There should be

a time limit on viewing feedback, to encourage continuous active involvement rather than passive viewing as of a commercial TV program. (27 ref)—*R. S. Albin.*

3594. Irwin, Eleanor; Levy, Paul & Shapiro, Marvin. (Pittsburgh Child Guidance Ctr, PA) **Assessment of drama therapy in a child guidance setting.** *Group Psychotherapy & Psychodrama*, 1972, Vol 25(3), 105-116.—Compared the effectiveness of drama therapy, activity therapy, and recreation therapy in treating disturbed children. Ss were 15 latency-age boys in 3 treatment groups of 5 each, which met weekly for 1½ hrs for 20 wks. Pre- and postevaluative measures were the Rorschach Index of Repressive Style (RIRS), a measure of verbal fluency, a semantic differential, and a parent competence scale. Drama group members made significant gains on the RIRS and verbal fluency test, while the other 2 groups did not. No significant changes were noted for the semantic differential or the parent competence scale for any of the groups. Results appear to validate the usefulness of drama therapy as a treatment technique for disturbed children.—*R. S. Albin.*

3595. Kardener, Sheldon H. (U California, Medical School, Los Angeles) **Sex and the physician-patient relationship.** *American Journal of Psychiatry*, 1974(Oct), Vol 131(10), 1134-1136.—Presents a psychodynamic discussion of why sexual relationships between physician and patient are not therapeutically beneficial. The concept of the physician as parent surrogate and its relationship to the incest taboo, the need to be loved, and the physician's position of power in relation to his patients are discussed. It is noted that these concerns must also be applied to the growing number of nonphysicians who engage in various modes of quasi-psychotherapy. (17 ref)—*Journal abstract.*

3596. Koran, Lorrin M. & Costell, Ronald M. (NIMH, Rockville, MD) **Early termination from group psychotherapy.** *International Journal of Group Psychotherapy*, 1973(Jul), Vol 23(3), 346-359.—Conducted a study of 11 outpatient psychotherapy groups to search for criteria that would identify patients likely to terminate group psychotherapy prematurely. Results indicate that patients who fail or refuse to complete questionnaires which probe feelings, personality, and projected group behavior are likely to terminate early. This criterion identifies 53% of terminators, and signals an 80% risk of terminating, in a clinic with a low termination rate (17% within 20 meetings). The criterion compares very favorably with others in the literature and is more useful than therapists' evaluations, correctly categorizing 89.5% of patients vs 67.5% with a lower false positive rate—3% vs 70%. Contrary to previous studies no relation was found between group FIRO-B (Fundamental Interpersonal Relations Orientation-Behavior) interchange compatibility and termination rate or between individual interchange compatibility and early termination. Early termination also was unrelated to questionnaire measures of cohesiveness and of preference for therapy-relevant behavior. (18 ref)—*R. S. Albin.*

3597. Krakowski, Adam J. (Champlain Valley-Physicians Hosp Medical Ctr, Div of Psychiatric Liaison & Research, Plattsburgh, NY) **Consultation psychiatry, present global status: A survey.** *Psychotherapy & Psychosomatics*, 1974, Vol 23(1-6), 78-85.—Argues that

psychiatric consultation services are inadequate and their usefulness widely unrecognized. Such services are more numerous where there are satisfactory numbers of psychiatrists and where general hospitals have psychiatric services and psychosomatic orientation. (17 ref)

3598. Lachman, Mildred. (Hillcrest Children's Ctr, Washington, DC) **The use of movement in art therapy.** *American Journal of Art Therapy*, 1973(Oct), Vol 13(1), 22-34.—Describes the art therapy program at Hillcrest Children's Center in Washington, DC, and presents examples of the author's recent research in the area of movement in art therapy.

3599. Levin, Lawrence S. & Shepherd, Irma L. (Georgia State U) **The role of the therapist in Gestalt therapy.** *Counseling Psychologist*, 1974, Vol 4(4), 27-30.—Discusses the Gestalt therapist's approach to dealing with everyday life in the present. The therapist starts with the client rather than with his own preconceived notions; he does not heal, but tries to lead the patient to heal himself. He takes responsibility for the therapy, but the client is responsible for his own feelings. The emphasis of Gestalt therapy is on the patient's feelings, emotions, and awareness.—H. Silverman.

3600. Lewis, Shelia. **Creative drama in the treatment of emotionally disturbed children from six years of age to pre-adolescence.** *Australian Occupational Therapy Journal*, 1974(Jan-Mar), Vol 21(1), 8-22.—Presents suggestions for the implementation of a therapeutic creative drama program for children. Some of the causes of emotional disturbances in children, general methods of treatment, and the value of creative drama are discussed. (21 ref)

3601. Maxmen, Jerrold S.; Tucker, Gary J. & LeBow, Michael D. (Dartmouth Coll, Medical School) **Rational hospital psychiatry: The reactive environment.** New York, NY: Brunner/Mazel, 1974. xii, 282 p. \$12.50.—Presents an integrated theoretical and practical framework for the treatment of hospitalized mental patients. A typology of contemporary inpatient facilities; 3 types of reactive environment—crisis intervention, token economy, and a therapeutic community; specific hospital procedures; and the roles of teaching, research, and record keeping are discussed. (12 p ref)

3602. McMurrer, James & Clark, Francis. (Georgetown U, Medical Ctr, Student Psychiatric Health Service) **Psychiatric intervention in the case of a terminally ill college student.** *Journal of the American College Health Association*, 1973(Dec), Vol 22(2), 134-137.—Presents the case history of a college freshman who entered her 1st semester with a prognosis of 4-18 mo to live. The emotional problems of this student and those around her, as the cancer progressed, are described.

3603. Minsal, W. R.; Bommert, H. & Pieritz, R. (Christian-Albrechts-U, Inst for Psychology, Kiel, W Germany) **[Relationship between formal speech characteristics of psychotherapists and the success of client-centered psychotherapy.]** (Germ) *Zeitschrift für Klinische Psychologie und Psychotherapie*, 1972, Vol 20(4), 303-310.—Conducted an experiment with 10 psychoneurotic males (mean age 24 yrs) and 8 male therapists of various degrees of experience to test the hypotheses (a) that the formal speech characteristics of a therapist can be

broken down into objective categories and statistically expressed and (b) that these characteristics are significantly correlated with the success of client-centered therapy. The sessions were recorded, transcribed, and rated by 7 naive students for formal components in the therapists' language. The patients were rated before and after the therapy for increased or decreased neuroticism and the results analyzed. The data reveal that (a) 5 patients improved, 5 did not; (b) the observers agreed to a large extent in their ratings of objective speech characteristics, and (c) the connection between therapeutic success and speech characteristics (computed by Spearman rank correlation) was significant. It is concluded that both hypotheses were confirmed. (English summary)—T. Fisher.

3604. Mullins, June B. (U Pittsburgh) **The expressive therapies in special education.** *American Journal of Art Therapy*, 1973(Oct), Vol 13(1), 52-58.—Discusses the role of art therapy in special education programs of public schools. Approaches suitable for children with physical as well as psychological problems are presented. The interrelationship of all the arts, and its implications for therapy, are considered.

3605. Nadelson, Carol; Notman, Malkah; Arons, Elissa & Feldman, Judith. (Harvard U, Medical School, Boston) **The pregnant therapist.** *American Journal of Psychiatry*, 1974(Oct), Vol 131(10), 1107-1111.—Discusses the relevance of a therapist's pregnancy to the therapeutic interaction, presenting case histories to illustrate the issues that arise. The therapist must deal with increased vulnerability, role integration, and dependency issues with colleagues. In the patient, the pregnancy may evoke infantile feelings, intensified maternal transference, and internal sexual conflicts. It is suggested that the therapist deal with her pregnancy openly and realistically and that working through the reactions of both therapist and patient may be an effective aspect of therapy.—*Journal abstract.*

3606. Neubauer, Peter B. (Child Development Ctr, New York, NY) **Review of Augusta Alpert's corrective object relations program.** *Psychosocial Process*, 1970, Vol 1(2), 7-13.—Describes the Corrective Object Relations (COR) treatment technique developed by A. Alpert. COR is used to treat children who display pathological behavior as a result of prolonged maternal deprivation. COR modifies the child's pathology by establishing a need-satisfying relationship between the child and a special teacher.

3607. Nichols, Michael P. & Reifler, Clifford B. (U Rochester) **The study of brief psychotherapy in a college health setting.** *Journal of the American College Health Association*, 1973(Dec), Vol 22(2), 128-133.—Describes a rationale and design for the study of psychotherapy in a university health service setting. Well-controlled studies of treatment variables are suggested, and one variable, catharsis-producing techniques, is discussed. Patient variables are not considered important in evaluating treatment. Therapists are described in terms of training, experience, orientation, and familiarity with technique used. The feasibility of conducting such a study with minimal disruption of a clinic's operation is confirmed, and recommendations are made for future studies. In

addition to careful design, the need for a cooperative team approach is underscored. (49 ref)—*R. S. Albin.*

3608. Pfeiffer, W. M. (U Erlangen-Nürnberg, Neuro-clinic & Polyclinic, W Germany) [Evolution of the client-centered psychotherapy of C. R. Rogers.] (Germ) *Praxis der Psychotherapie*, 1973(Apr), Vol 18(2), 75-81.

3609. Pickford, Ruth. The versatility of the World Technique. *British Journal of Projective Psychology & Personality Study*, 1973(Dec), Vol 18(2), 21-23.—Describes M. Lowenfeld's World Technique and discusses its use in clinical practice and research, including psychotherapy, diagnosis, and assessment of handicapped children. Detailed instructions for administration are presented together with illustrative case studies.

3610. Pine, Sandra. (Albert Einstein Coll of Medicine, Bronx Municipal Hosp Ctr, Yeshiva U) **Fostering growth through art education, art therapy, and art in psychotherapy.** *American Journal of Art Therapy*, 1974(Jan), Vol 13(2), 83-117.—Reports results of a masters thesis project in a general elementary school in New York City demonstrating the use of art as a tool for self-reflection both in public school and hospital settings.

3611. Pope, Benjamin; Nudler, Sylvia; Vonkorff, Michael R. & McGhee, James P. (Sheppard & Enoch Pratt Hosp, Baltimore, MD) **The experienced professional interviewer versus the complete novice.** *Journal of Consulting & Clinical Psychology*, 1974(Oct), Vol 42(5), 680-690.—Compared interviewer behavior and efficacy of complete novices and experienced professionals. In each of 2 studies interviewees were 16 female undergraduates. 16 interviewers were professionals, and 16 were novices. Interviewees rated the novices more benignly than the professionals but the professionals were rated as more skilled. There were no significant differences between the 2 groups on genuineness and warmth, with 1 questionable difference in favor of the professionals on empathy, as measured by the Truax and Carkhuff scales, Non-Possessive Warmth, Genuineness or Self-Congruence, and Accurate Empathy. Novice interviewers were more anxious (higher non-ah ratios). None of the payoff variables (e.g., productivity) in interviewee response distinguished between the professionals and novices. The "novice" but not the "professional" interviews conformed to a synchrony model on productivity. (42 ref)—*Journal abstract.*

3612. Remschmidt, H.; Dauner, I. & Schultz, U. (Philipps U Marburg, Clinic for Child & Adolescent Psychiatry, W Germany) [Structural analysis of patients in a psychiatric-psychotherapeutic ward for children and adolescents.] (Germ) *Praxis der Kinderpsychologie und Kinderpsychiatrie*, 1974(Feb), Vol 23(2), 42-46.—Reports on 153 inpatients 6-13 yrs old admitted to a child psychiatric clinic in 1969. 60% of the patients were boys. 30% grew up in broken homes. 48% suffered from school problems, 46% from disorders of socialization, 37% showed aggressive behavior, and 32% anxiety states. 3 essential needs are emphasized: (a) for family therapy, (b) for additional training for all personnel working in the ward, and (c) for a continuous flow of information about all events in the ward.—*Journal summary.*

3613. Rock, Nicholas L. **Childhood psychosis and long-term chemo and psychotherapy.** *Diseases of the Nervous System*, 1974(Jul), Vol 35(7), 303-308.—De-

scribes a multidisciplinary approach to the problem of childhood psychosis which involves individual and group psychotherapy with children and parents and adjunct chemotherapy. Procedures involved in conducting the prepsychiatric examination, determining the type and dosages of antipsychotic medications, and diagnosing the specific type of psychosis early in therapy are described. A case history of a boy receiving long-term psychotherapy and chemotherapy is presented, as well as summaries of child, parent, and professional staff characteristics. The complexity of childhood psychosis is emphasized. It is concluded that with early detection and appropriate medication and supportive care, secondary mental retardation and/or deterioration of the child to a more severe psychotic state can be prevented.—*L. Gorse.*

3614. Rubin, Judith A. (Pittsburgh Child Guidance Ctr, PA) **Mother-child art sessions: I. Treatment in the clinic.** *American Journal of Art Therapy*, 1974(Jan), Vol 13(2), 165-181.—Presents the 1st of 2 articles, dealing with clinical treatment of mother and child by art therapy. The use of such therapy as part of a broader range of treatment of family problems is discussed.

3615. Runkles, J. E. (Bonnie Doon Baptist Church, Edmonton, Alberta, Canada) **Religion and psychiatric practice.** *Canadian Psychiatric Association Journal*, 1974(Feb), Vol 19(1), 79-85.—Describes 70 patients referred to the author, a clergyman as well as a psychiatrist, according to religious affiliation, diagnosis, age, sex, and referral source. Data suggest that the evangelical patient requesting a psychiatrist of similar religious orientation is most likely to be a depressed woman in her 20's and referred by a physician. A case example is used to illustrate both the integrative and the dysfunctional effects of religious faith. In manic patients religious experience is grandiose, self-centered, and superficial, representing a regressive identification by the patient. (French summary)—*F. Auld.*

3616. Rüger, Ulrich. [Indications for psychoanalytical therapy by multifactorial symptoms.] (Germ) *Praxis der Kinderpsychologie und Kinderpsychiatrie*, 1974(Feb), Vol 23(2), 33-41.—Endeavored to obtain criteria for a differentiated indication of analytical psychotherapy with children having organic brain damage coupled with a neurotic personality development. 2 criteria were found: (a) lack of processes of drive and drive reduction, and (b) a certain amount of introjection. These criteria are also considered good indicators for defective perception of emotions. Based on observations from a 1-yr intake of a psychiatric institute (355 5-10 yr olds, of whom 65 had organic brain damage) a description is given of the problems arising from the primary and secondary neuroses of these organically damaged children.—*H. A. Euler.*

3617. Schmidtchen, Stefan. (U Kiel, Psychological Inst, Clinical Div, W Germany) [Effects of client-centered play therapy.] (Germ) *Zeitschrift für Klinische Psychologie*, 1973, Vol 1(2), 49-63.—Studied the effects of client-centered play therapy with 30 emotionally and socially disturbed children 9-12 yrs old to test 4 hypotheses: that this therapy would (a) diminish emotional difficulties such as psychoneuroticism and anxiety; (b) improve speech behavior by increasing vocabulary,

fluency, mental flexibility, and creativity; (c) reduce emotional and social behavioral disorders; and (d) achieve personality changes such as greater independence and social adjustment. Ss were divided into a therapeutic and a control group of 15 each, matched, on the basis of a battery of pretests, for IQ, neuroticism, intro-extraversion, anxiety, social maturity, and adjustment and behavioral disorders. In a 4-mo period the therapeutic group took part in 15 nondirective play therapy sessions administered by 6 therapists who coordinated their approach and procedures. The ensuing changes were evaluated by educators and therapists in posttests. Analyses of the data produced 68 significant correlations ( $p < .05$ ). Results confirm the 4 hypotheses. (English summary) (34 ref)—*T. Fisher*.

3618. **Shapiro, Rodney J.** (U Rochester, Medical Ctr, Family Studies & Treatment Program) **Therapist attitudes and premature termination in family and individual therapy.** *Journal of Nervous & Mental Disease*, 1974(Aug), Vol 159(2), 101-107.—Randomly assigned patients at a child study clinic to individual or family therapy. Each of the 24 patients and 27 families was rated by the therapist in charge on the therapist's affective responses to the patients, for degree of psychopathology, and the treatment prognosis. These ratings for individuals and families who dropped out prematurely were compared with ratings of those who continued in treatment. The most significant difference between continuers and terminators emerged in the therapists' ratings of their own affective reactions to the patients or families; responses to the continuers were consistently much more positive than to the dropouts. However, this difference was less marked for families than for individual patients. No significant difference was found between continuers and terminators on ratings of psychopathology. This held true for both individual patients and families. Finally, continuers were perceived by the therapists as having significantly better treatment prognoses than terminators. These findings suggest that (a) patients who terminate prematurely are not more disturbed than those who continue, (b) premature termination may be a behavioral reaction to the negative feelings of therapists, and (c) families seem to evoke less negative countertransference than do individual patients. (15 ref)—*Journal abstract*.

3619. **Sheldon, Robert B.; Davis, Harry G. & Kohorn, Ron L.** (Big Spring State Hosp, TX) **Individual counseling and therapy with the alcoholic abuser.** In J. G. Cull & R. E. Hardy (Eds), *Alcohol abuse and rehabilitation approaches*. Springfield, IL: Charles C Thomas, 1974. xiii, 203 p. \$12.75.—Suggests that individual therapy is the best method for treating alcoholics in a variety of best settings and under different circumstances, particularly when part of a comprehensive alcoholism program. Practical considerations for the therapist, the therapist's orientation to the alcoholic, and techniques of individual therapy with alcoholics are discussed.

3620. **Shelton, John L. & Ackerman, J.** (Colorado State U, Counseling Ctr) **Homework in counseling and psychotherapy: Examples of systematic assignments for therapeutic use by mental health professionals.** Springfield, IL: Charles C Thomas, 1974. xiii, 293 p. \$16.75(cloth), \$12.95(paper).—Describes the rationale of

and procedure for the therapeutic use of homework assignments in counseling and psychotherapy. Case examples and sample homework assignments for 7 types of disorders are presented, and the history of and relevant research on homework as an adjunct to counseling are discussed. (13 p ref)

3621. **Shrout, Richard N.** (Hypnotherapy Clinic, Miami, FL) **Rehabilitation of a delinquent youth by means of hypnotic suggestion.** *Journal of the American Institute of Hypnosis*, 1973(Sep), Vol 14(5), 227-228.—Describes the use of hypnotherapy and self-hypnosis instruction in treating a chronic 14-yr-old male delinquent. Projective test results, anxiety scale evaluations, and observations conducted after 1 mo indicate greatly reduced levels of anxiety, an absence of antisocial and resentful attitudes, and improved interpersonal relationships and self-control.

3622. **Stewart, R. Dugald.** (Georgia State U) **The philosophical background of Gestalt therapy.** *Counseling Psychologist*, 1974, Vol 4(4), 13-14.—Discusses the views of F. Perls who was more concerned with living reality than with a "systems" approach. He was not interested in complex philosophical questions, but dealt with the individual and his relationship to himself and his environment. Perls was more attracted to the "how" than to the "why." The German philosopher S. Friedlander influenced him more than anyone else. Perls was not a systematic thinker. His therapy followed the principle of "creative" indifference.—*H. Silverman*.

3623. **Tardiff, Kenneth J.** (Greater Vancouver Mental Health Project, British Columbia, Canada) **A survey of psychiatrists in Boston and their work with violent patients.** *American Journal of Psychiatry*, 1974(Sep), Vol 131(9), 1008-1011.—Results of a survey responded to by 156 Boston psychiatrists indicate that fewer than half of the psychiatrists evaluate or treat violent patients. Psychiatrists working with violent patients tended to be under 40 yrs old and in residency training. Patterns of treatment, suggestions for prevention of violent episodes, types of patients, and sources of referral are described. (19 ref)

3624. **Thorne, Sylvia.** (Georgia State U) **Translations of Gestalt theory into technique: Polarities and centering.** *Counseling Psychologist*, 1974, Vol 4(4), 31-33.—Describes the individualized approach of Gestalt therapy. A major technique involves role-playing of exaggerated aspects of one's self, so that uninterpreted conflicts can be absorbed into the psyche. Growth involves becoming aware of what has been repressed. Past events are examined in terms of their relevances to the present. It is suggested that Gestalt therapy can be called "the psychology of the obvious." The aim is to free the patient's feelings and thus lead to action. 11 techniques to accomplish this are listed.—*H. Silverman*.

3625. **Toomim, Marjorie K.** **The child of divorce.** In R. E. Hardy & J. G. Cull (Eds), *Therapeutic needs of the family: Problems, descriptions and therapeutic approaches*. Springfield, IL: Charles C Thomas, 1974. xv, 240 p.—Discusses problems encountered by the child whose parents are divorced, including losses of faith and trust, the parent-child relationship, environmental supports, and the child's own predivorce personality and life-style. Suggestions for helping the child through the necessary

mourning process are presented, and characteristic child defenses against loss are described. (24 ref)

3626. Van Den Aardweg, Gerard J. [The factor "complaining," neurosis and homophilia.] (Duth) *Psychologica Belgica*, 1973, Vol 13(3), 295-311.—Explains neurosis by the central concept of autonomous self-pity, a repressed reaction to psychic traumatization in childhood that has priority over sex, anxiety, and aggression. 2 types of therapy are suggested: (a) self-observation and self-analysis to recognize the inner child of the past and (b) humor therapy. Homophilia (homosexuality) is defined as neurosis. Factor analysis of data from a homosexuality questionnaire administered to 51 homosexuals revealed 6 factors: (a) neurosis, (b) will to change, (c) character weakness, (d) mother-bind factor, (e) social extraversion, and (f) "lone wolf" pattern in childhood. Therapy was successful in 8 cases, partly successful in 18, and incomplete in the others. (English abstract) (34 ref)—S. Slak.

3627. von Dürckheim, K. [The use of meditative practices in psychotherapy.] (Germ) *Praxis der Psychotherapie*, 1973(Apr), Vol 18(2), 63-74.

3628. Yampey, Nasim. [Transference and countertransference.] (Span) *Acta Psiquiátrica y Psicología de América Latina*, 1974(Feb), Vol 20(1), 11-22.—Discusses 4 approaches to the processes of transference and countertransference: the orthodox method, ego psychology, the doctrine of Melanie Klein, and the concepts of the Argentine psychoanalytic school. A distinction is made between concordant transference (when the therapist's ego is identified with the patient's ego) and complementary transference (when identifications are made with the patient's internal objects).—English summary.

### Drug Therapy & Drug Rehabilitation

3629. Arfwidsson, L. et al. Can self-rating replace doctor's rating in evaluating anti-depressive treatment? *Acta Psychiatrica Scandinavica*, 1974, Vol 50(1), 16-22.—16 depressive outpatients with endogenous or mixed endogenous-psychogenic depression were rated before and during antidepressive drug treatment with imipramine or chlorimipramine. Rating measures used were a Swedish version of the Zung Self-Rating Depression Scale, B. Cronholm and J. O. Ottosson's depression scale, and a global rating. The scores displayed a parallel course, but the correlations between them were only moderate, and correlations between the score differences were still lower. When levels of significance of score differences and global ratings were used as measures of treatment effects, the self-ratings were least sensitive. The study gives no support for a replacement of the doctor's rating scale with the Self-Rating Depression Scale.—Journal abstract.

3630. Atia-Muftic, Isaad. (Merced Hosp, Dublin, Ireland) Control of hypertension during electrical hypnosis. *Journal of the American Institute of Hypnosis*, 1973(Sep), Vol 14(5), 235-239.—Investigated the effects of adrenergic blocking agents (phentolamine hydrochloride), ganglion blocking agents (pentolinium tartrate), and axon membrane potential blocking agents (tetrodotoxin and physalaemin) on 8 patients with essential hypertension in whom electrical hypnosis had been

induced. All agents used had some protective effects on the increased blood pressure rates resulting from electrical brain stimulation, although the best results were obtained with physalaemin, which acted immediately and did not interfere with the induction and maintenance of hypnosis. The ganglion and adrenergic blocking agents prevented increases in blood pressure but almost doubled induction time and, after the electrical current had been stopped, S appeared to be withdrawn and uncommunicative.—L. Gorsey.

3631. Ballinger, Brian R.; Simpson, Elliott & Stewart, Michael J. (Royal Dundee Liff Hosp, Scotland) An evaluation of a drug administration system in a psychiatric hospital. *British Journal of Psychiatry*, 1974(Aug), Vol 125, 202-207.—Assessed the reliability of drug administration to 236 psychiatric inpatients following the introduction of a new drug administration system. Patients' urine was tested for various psychotropic drugs. Results show that in 15 patients, prescribed drugs were not detected, in 24 patients nonprescribed drugs were detected, and in 4 patients both kinds of discrepancy were present. The relationships between these discrepancies and certain characteristics of the patients and drugs are discussed. Possible causes of these findings include nurse error, patient noncooperation, laboratory error, and abnormalities of metabolism. The inpatients resident in a portion of a mental subnormality hospital were also investigated, and discrepancies were found both before and after the introduction of the new system. (16 ref)—Journal summary.

3632. Bartoszewicz, Sławomir; Czerwiński, Andrzej; Strzyżewski, Włodzimierz & Lisowska, Jadwiga. (Poznań Medical Academy, Psychiatric Clinic, Poland) [Remarks on the usefulness of combined pharmacological treatment in endogenous depressive syndromes.] (Polh) *Psychiatria Polska*, 1972(Sep), Vol 6(5), 557-561.—Observed 24 cases of endogenous depressive syndromes and concluded that combined treatment with thymoanaleptics and neuroleptics is a beneficial therapeutic method which provides relatively rapid and simultaneous control of several main depressive symptoms, particularly anxiety. The treatment requires lower doses of thymoanaleptics and neuroleptics for a shorter time than are usually required in treatment with antidepressive agents only. (Russian summary) (18 ref)—English summary.

3633. Bauer, Raymond B. & McHenry, John T. (Wayne State U) Comparison of amantadine, placebo, and levodopa in Parkinson's disease. *Neurology*, 1974(Aug), Vol 24(8), 715-720.—A double-blind cross-over trial of amantadine hydrochloride and placebo, each given for 3-wk periods, was performed on 40 outpatients with Parkinson's disease. Conventional antiparkinsonian drugs were continued during the 3-wk period. Amantadine was effective by objective measurements (timed tests) and subjective ratings of tremor and rigidity. Amantadine produced an average 16% objective improvement over baseline in the 40 patients. At the end of a 3rd 3-wk period, during which conventional drugs had been stopped, amantadine produced a 21% improvement compared with baseline. After 6-9 wks of levodopa added to amantadine, there was a 28% improvement over baseline. Amantadine appears to be a useful adjunct in the treatment of Parkinson's disease, and amantadine

and levodopa together may be effective combination therapy.—*Journal abstract.*

3634. **Biermann, I. & Pflug, B.** (U Tübingen, Neuro-clinic, W Germany) [A case of childhood cyclothymia associated with familial loading.] (Germ) *Acta Paedopsychiatrica*, 1974, Vol 40(5), 196-203.—Presents the clinical picture of a 13-yr-old boy, a cyclothymic in the pattern of his mother's family, which was characterized by a bipolar course, not differing from that seen in adults. Was this a genuine psychogenic disorder, or an anomaly induced by the mother and imitating her symptoms? Episodic mood changes in the years before the manifestation of the psychosis might be seen as prodromal episodes within the framework of the course of the disorder. Thymoleptics, neuroleptics, and shock therapy brought about amelioration to a normal state. With the help of lithium prophylaxis no relapse was seen after more than 2 yrs.—*G. Rubin-Rabson.*

3635. **Brambilla, F. ; Guerrina, A.; Riggi, F. & Ricciardi, F.** (Ospedale Paolo Pini, Milano Affori, Italy) **Psychoendocrine investigation in schizophrenia: Relationship between pituitary-gonadal function and behavior.** *Diseases of the Nervous System*, 1974(Aug), Vol 35(8), 362-367.—Examined 12 18-36 yr old hebephrenic schizophrenic males to determine the possible connections between the schizophrenic syndrome and the hypothalamo-pituitary-gonadal system. Ss were treated for 30 days with haloperidol, and then for 45 days with an equal dose of haloperidol plus chorionic gonadotropin (HCG). 5 hormonal assays (e.g., total urinary gonadotrophins) were performed twice prior to therapy, twice during the haloperidol therapy, twice during the haloperidol plus HCG therapy, and 1 mo after therapy withdrawal. Psychological-behavioral parameters were examined using the Wittenborn Rating Scale. Results show a stimulatory effect of the haloperidol plus HCG therapy on the deficient hormonal status. A constant correlation also existed between biochemical improvement and behavioral improvement, particularly in affective disorders, adjustment to reality, and active behavior. (21 ref)—*Journal summary.*

3636. **Carlson, Eric T.** (New York Hosp—Cornell Medical Ctr, NY) **Cannabis indica in 19th-century psychiatry.** *American Journal of Psychiatry*, 1974(Sep), Vol 131(9), 1004-1007.—Presents the history and usage of cannabis indicus (the 19th-century pharmacological term referring to the plant today called cannabis sativa indica). A review of the drug's physiological and psychological effects reveals that most of the effects reported in the 1960s were known to writers of the 19th century when the drug was alternately considered a cure for and a cause of insanity. (36 ref)

3637. **Charalampous, K. D.; Freemesser, G. F.; Maley, J. & Ford, Kathryn.** (Baylor Coll of Medicine, Houston, TX) **Loxapine succinate: A controlled double-blind study in schizophrenia.** *Current Therapeutic Research*, 1974(Aug), Vol 16(8), 829-837.—Compared loxapine succinate to thiothixene and placebo in a 4-wk study of 60 hospitalized schizophrenics. Statistical analyses of the expanded Brief Psychiatric Rating Scale showed the thiothixene group to be more improved than the other 2 groups, as did the physicians Clinical Global Improvement (CGI) ratings at 2 wks. Nurses Observation Scale

for Inpatient Evaluation ratings at 2 and 4 wks and CGI ratings at 4 wks failed to discriminate between groups. Side effects were reported by significantly more patients in the active treatment groups than in the placebo group. Extrapyramidal side effects and drowsiness were the most frequently reported symptoms in the active groups, with extrapyramidal effects more prevalent in the thiothixene than in the loxapine group. Results are compared with 4 similar investigations. Inconsistencies in methodology are discussed. (15 ref)—*Journal abstract.*

3638. **Cull, John G. & Hardy, Richard E.** (Eds.). (Virginia Commonwealth U) **Alcohol abuse and rehabilitation approaches.** Springfield, IL: Charles C Thomas, 1974. xiii, 203 p. \$12.75.

3639. **de Leon, George.** (Phoenix House Foundation, New York, NY) **Phoenix House: Psychopathological signs among male and female drug-free residents.** *Addictive Diseases: An International Journal*, 1974, Vol 1(2), 135-151.—Administered a battery of psychological tests (e.g., Beck Depression Inventory and the Multiple Affect Adjective Check List) to 148 male and 60 female drug addicts participating in the Phoenix House therapeutic community program. Results show that (a) males and females consistently scored in the psychiatric range on all scales, although the magnitude of the scores reduced with time in program for both sexes; (b) scores dropped significantly for a subgroup of males and females retested after 7½ mo; (c) male and female dropouts scored consistently higher than their counterparts who remained in the program; and (d) black males and females scored significantly lower than all others, white males and females and Spanish females scored highest. The meaning and modification of addiction requires clarification of psychological differences between males and females.—*Journal abstract.*

3640. **Dooling, Elizabeth C.; Schoene, William C. & Richardson, Edward P.** (Massachusetts General Hosp, Boston) **Hallervorden-Spatz syndrome.** *Archives of Neurology*, 1974(Jan), Vol 30(1), 70-83.—Reports on 2 sisters with Hallervorden-Spatz syndrome. One died when 24 yrs old; the other survived at that age under levodopa treatment that improved the motor abnormalities. Both patients showed characteristic clinical features: occurrence at a young age; motor disorder, mainly of the extrapyramidal type; mental changes indicative of dementia; and a relentlessly progressive course of the disease, extending over several years. Postmortem examination of 64 Ss with this syndrome revealed considerable variability in clinical features and in the extent of neuropathologic changes, justifying the identification of several subgroups of symptoms. Further studies of Ss with Hallervorden-Spatz syndrome should include catecholamine analyses of cerebrospinal fluid and brain tissue, and a search for possible viral infection. (72 ref)—*E. A. Gavin.*

3641. **Dwarshuis, Louis; Kolton, Marilyn S. & Gorodezky, Michael.** (U Michigan, Organization for Applied Science in Society) **The treatment approach of innovative drug programs for youth.** *Drug Forum*, 1974(Spr), Vol 3(3), 249-257.—Study of the treatment approaches of 72 innovative drug programs showed that a wide variety of services were offered on a routine basis, including individual and group counseling, crisis inter-

vention, consciousness-raising techniques, and alternative activities.

3642. **Elizur, Avner & Klein, Morris M.** (Bar Ilan U, Tel Aviv, Israel) **Similarity, complementarity and difference of marital couples in problem and non-problem areas.** *Israel Annals of Psychiatry & Related Disciplines*, 1974(Jun), Vol 12(2), 145-155.—Administered Plutchik's Emotional Profile Index (EPI) to 30 couples referred to family therapy because of marital maladjustment. 24 couples completed the EPI twice, rating themselves once and their spouses the 2nd time. EPI scores were compared for (a) self-rating of the husband vs the self-rating of the wife, (b) self-rating of husband vs husband's rating of the wife, (c) self-rating of the wife vs wife's rating of the husband, and (d) husband's rating of the wife vs wife's rating of the husband. When the husband and wife each rated themselves, they manifested fewer problems than when they each rated their partner. Spouses rated their mates more negatively than mates rated themselves. It is suggested that in assessing a marital relationship, it may not be sufficient to compare the traits of each spouse individually; it may also be necessary to compare how each rates himself and his mate on the same traits. Findings also indicate that while couples do not complement each other on emotional traits, one partner compensates for the problems of the other by exhibiting fewer problems. (23 ref)—*Journal abstract*.

3643. **Escobar, Javier I.; Schiele, Burtrum C. & Zimmermann, Robert.** (U Minnesota, St Paul-Ramsey Hosp & Medical Ctr) **The tranlycypromine isomers: A controlled clinical trial.** *American Journal of Psychiatry*, 1974(Sep), Vol 131(9), 1025-1026.—Tested the positive (+) and negative (-) isomers of tranlycypromine (Parnate) under double-blind conditions on 11 depressed inpatients. The (-) isomer was the more effective and produced fewer side effects. Because the (-) isomer has been shown to be a stronger blocker of the reuptake mechanism for brain amines and a weaker inhibitor of monoamine oxidase than the (+) isomer, the results obtained here are of particular interest.—*Journal abstract*.

3644. **Fabre, Louis F. & Harris, Robert T.** (U Texas, Medical School, Houston) **Pilot open-label study on U-28,774, in anxious in-patients.** *Current Therapeutic Research*, 1974(Aug), Vol 16(8), 848-852.—Conducted an uncontrolled study of ketazolam (U-28,774) in 25 patients diagnosed as experiencing anxiety neurosis of such severity as to require hospitalization. A general and rather profound amelioration of anxiety symptoms was noted after 2 wks of treatment in all patients. This improvement persisted throughout the 4-wk study period. Side effects were observed in only a few patients, and these were limited to mild dizziness or drowsiness and occurred only upon initiation of treatment or when dosages were increased to any considerable extent.—*Journal abstract*.

3645. **Fann, William E. & Lake, C. Raymond.** (Duke U, Medical Ctr) **On the coexistence of Parkinsonism and tardive dyskinesia.** *Diseases of the Nervous System*, 1974(Jul), Vol 35(7), 324-326.—Describes the evaluation and treatment of 3 male 52-, 55-, and 58-yr-old psychiatric patients who exhibited clinical evidence of

both parkinsonism and a marked buccofaciolingual dyskinesia. Changes in the manifestations of parkinsonism associated with trihexyphenidyl and amantadine therapy, and the possible reciprocity of symptoms in the 2 disorders are discussed.

3646. **Fann, William E.; Lake, C. R.; Gerber, C. J. & McKenzie, G. M.** (Baylor Coll of Medicine, Houston, TX) **Cholinergic suppression of tardive dyskinesia.** *Psychopharmacologia*, 1974, Vol 37(2), 101-107.—Notes that tardive dyskinesia (TD), a hyperkinetic disorder associated with long-term neuroleptic treatment, may be a manifestation of imbalance of opposing dopamine and acetylcholine dependent systems in the central nervous system (CNS) (i.e., hyperdopamine activity or hypocholinergic function). Dopamine blocking agents give some transient relief of symptoms. In the present study, physostigmine, an anticholinesterase which enhances CNS acetylcholine action, was given to 7 55-70 yr old schizophrenic inpatients with TD, and measurements of their pathological movements were made before, 45 min, and 24 hrs later. All 7 Ss showed significant suppression of movement at 24 hrs. Many showed measurable decrement at 45 min. Side effects were minimal and transient. (15 ref)—*Journal abstract*.

3647. **Favazza, Armando R. & Martin, Patricia.** (U Missouri, Medical School, Columbia) **Chemotherapy of delirium tremens: A survey of physicians' preferences.** *American Journal of Psychiatry*, 1974(Sep), Vol 131(9), 1031-1032.—To clarify the confusion in the literature concerning the chemotherapy of delirium tremens, questionnaires were sent to selected experienced physicians throughout the nation. Out of 101 useful responses, 86 physicians chose a benzodiazepine as a primary drug of choice. Of these, 64 favored chlordiazepoxide and 22 favored diazepam. The overall mortality of the patients they treated appeared to be quite low.—*Journal abstract*.

3648. **Flemenbaum, Abraham.** (Texas Tech U, Medical School) **Affective disorders & "chemical dependence": Lithium for alcohol and drug addiction?** *Diseases of the Nervous System*, 1974(Jun), Vol 35(6), 281-285.—Presents a working hypothesis for the treatment of some types of "chemical dependence," based on data that alcoholism and/or chemical dependence (as well as other disorders such as sociopathy) are heterogeneous syndromes. The literature suggests that some types of alcoholism may be genetically related to affective disorders, and that alcoholism and other related disorders could be "parapsychiatric" manifestations of subpsychotic mood swings. There has been increasing evidence that selected cases of depressive disorders respond to prophylactic administration of lithium carbonate, and that lithium seems to be beneficial in disorders other than affective ones. It is suggested that lithium could be of benefit in the prophylaxis of these types of parapsychiatric disorders. (36 ref)—*Journal summary*.

3649. **Fontana, A. E. & Loschi, J. A.** (Argentinean Assn of Psychotherapy, Buenos Aires) **[Antidepressive therapy with CI 581.]** (Span) *Acta Psiquiátrica y Psicología de América Latina*, 1974(Feb), Vol 20(1), 32-39.—Reports on the use of a substance, 2-(orto-chlorophenyl)-2-(methylamine) cyclohexanone hydrochlorate, to achieve regression in the psychoanalytic treat-

ment of depression. The drug's main advantages over other pharmacological agents are outlined.

3650. Fried, Suzanne R. (Jerusalem Mental Health Ctr, Israel) **Supportive services in the rehabilitation of the drug user.** *Drug Forum*, 1974(Spr), Vol 3(3), 277-282.—In an attempt to prevent the return of addicts to drug use, treatment followed by efforts at rehabilitation are offered. Sometimes these efforts are concurrent. Supportive services which can be used to increase the effectiveness of rehabilitation are described, and the use of existing community services is advocated.

3651. Gallenkamp, Ulrich. (Kassel Hosp, Neurological Clinic, W Germany) **[A 14-year-old boy with reactively caused "amnesia."]** (Germ) *Praxis der Kinderpsychologie und Kinderpsychiatrie*, 1974(Feb), Vol 23(2), 46-50.—Reports a case of pretended sudden loss of memory which was recovered after 2 days of neuroleptic therapy. The cause of the "amnesia," uncovered in 2 drawings of a tree, was an inescapable chronic depressive conflict. (18 ref)

3652. Goldberg, Harold L.; Finnerty, Richard J. & Cole, Jonathan O. (Boston State Hosp, MA) **Doxepin: Is a single daily dose enough?** *American Journal of Psychiatry*, 1974(Sep), Vol 131(9), 1027-1029.—Conducted a post hoc comparison of 2 very similar doxepin studies that included outpatients with mixed anxiety and depression. The 1st study used a 3 times/day schedule with 23 patients and the 2nd used a bedtime schedule with 21 patients. All differences between the 2 treatments favored the bedtime regimen. Although the 2 separate studies cannot take the place of a direct comparison between the 2 dosage schedules, they offer evidence for the usefulness and value of single-dose bedtime medication of anxious-depression outpatients receiving doxepin treatment. (15 ref)—*Journal abstract*.

3653. Goldman, Mark S. (Wayne State U) **To drink or not to drink: An experimental analysis of group drinking decisions by four alcoholics.** *American Journal of Psychiatry*, 1974(Oct), Vol 131(10), 1123-1130.—Examined the effects of social influence on the initiation, maintenance, and termination of drinking in 4 male 37-51 yr old chronic alcoholics. Ss made decisions in a group setting about alcohol and cigarette use for which they earned reinforcement points redeemable for drinks and cigarettes during the study or for money at its end. Decision making delayed the initiation of drinking and lowered overall alcohol consumption during a period of prolonged drinking but was not effective in inducing early termination of the drinking episode. Mood disturbances (assessed by the Mood Adjective Check List), physical symptoms, and psychopathology (Wittenborn Psychiatric Rating Scales) became more pronounced when the amount of alcohol consumed increased. The extent of decision making changed during times of high motivation for drinks or cigarettes; these decisions were mainly a function of individual leadership. The possible utility of the group decision-making model as a tool for the treatment of alcoholism is discussed. (23 ref)—*Journal abstract*.

3654. Green, J. R. et al. (U Washington, Seattle) **Sulthiame: Evaluation as an anticonvulsant.** *Epilepsia*, 1974(Sep), Vol 15(3), 329-349.—Results of double-blind crossover study show that sulthiame as sole anticonvul-

sant was preferable to diphenylhydantoin in only 4 of 21 seizure patients. Other patients had more seizures or unbearable toxicity on sulthiame. When the concentration of diphenylhydantoin in serum was increased and other anticonvulsants withdrawn, seizures were better controlled and side effects often diminished. Although the few patients who benefited by sulthiame alone felt more alert, neuropsychologic tests showed that organic communications and intellectual processing deficits were accentuated. Hyperpnea could be troublesome. It is concluded that previous favorable reports on sulthiame may have been due to the increase it causes in serum diphenylhydantoin when the 2 drugs are given together. (French, German, & Spanish summaries) (34 ref)—*Journal summary*.

3655. Guilleminault, Christian; Carskadon, Mary & Dement, William C. (Stanford U, Medical School, Sleep Disorders Clinic & Lab) **On the treatment of rapid eye movement narcolepsy.** *Archives of Neurology*, 1974(Jan), Vol 30(1), 90-93.—Obtained subjective sleep reports approximately every other month from 50 Ss diagnosed as having rapid-eye-movement narcolepsy. 21 were females 23-52 yrs old and 29 were males 15-61 yrs old. Daytime sleep attacks and cataplexy were the indexes for judging effectiveness of medication with amphetamine, tricyclic antidepressant drugs, imipramine hydrochloride, and clomipramine hydrochloride. None of these provided effective and harmless treatment for daytime sleep attacks. However, for cataplexy, sleep paralysis, and hypnagogic hallucinations imipramine hydrochloride and clomipramine hydrochloride appeared to be effective. (25 ref)—E. A. Gavin.

3656. Haig, John R.; Schroeder, Carolyn S. & Schroeder, Stephen R. (U North Carolina, Chapel Hill) **Effects of methylphenidate on hyperactive children's sleep.** *Psychopharmacologia*, 1974, Vol 37(2), 185-188.—Compared EEG sleep patterns recorded from 6 8-14 yr old male hyperactives taking methylphenidate daily to those of 6 6-12 yr old normal male controls. For the hyperactive Ss significant increases in latency to both sleep onset and the 1st rapid eye movement period were obtained. Other sleep measures were normal. The hypothesis that the therapeutic effects of stimulants upon hyperactive children are independent of any pathological disruption of sleep was supported. (17 ref)—*Journal abstract*.

3657. Harshman, Gordon A. (U Arizona) **Alternatives to divorce and their implications.** In R. E. Hardy & J. G. Cull (Eds), *Therapeutic needs of the family: Problems, descriptions and therapeutic approaches*. Springfield, IL: Charles C Thomas, 1974. xv, 240 p.—Describes several alternatives to divorce, including continuation of the status quo, trial separation, renegotiation with accommodation, and working through to constructive integration. Activities and exercises for improving self-understanding and clarifying the decision-making process are also discussed, and suggestions for counselors working with couples deciding about divorce are included.

3658. Haslam, M. T. (Clifton Hosp, York, England) **The relationship between the effect of lactate infusion on anxiety states, and their amelioration by carbon dioxide inhalation.** *British Journal of Psychiatry*, 1974(Jul), Vol 125, 88-90.—Administered either sodium

D, lactate or glucose saline infusions to 16 patients showing symptoms of pervasive anxiety or agoraphobia. Ss received both treatments 4 days apart. Regardless of the response to the lactate infusions, Ss received a series of carbon dioxide inhalation therapy treatments 2 times/wk for the next 6 wks. 10 patients showed positive responses to lactate infusions in that a panic reaction was evoked within a few minutes which ceased on discontinuance of the infusion; of these 10, 9 showed immediate positive responses to the relief of anxiety symptoms with the carbon dioxide treatment. 6 patients showed no panic reactions with either lactate or glucose saline infusions.—*L. Gorsey.*

3659. Heilbrum, Alfred B. (Emory U) **Predicting rehabilitation outcome in alcohol abuse.** In J. G. Cull & R. E. Hardy (Eds), *Alcohol abuse and rehabilitation approaches*. Springfield, IL: Charles C Thomas, 1974. xiii, 203 p. \$12.75.—Defines and discusses the reasons for outcome prediction, and considers problems inherent in setting up a prediction system in an alcoholic treatment program. Possible directions of future outcome prediction systems are presented.

3660. Henry, George M. (U Kentucky, Medical School) **Treatment and rehabilitation of narcotic addiction.** In R. J. Gibbons et al (Eds), *Research advances in alcohol and drug problems: I*. New York, NY: John Wiley & Sons, 1974. xvii, 428 p.—Discusses and reviews evidence of the effectiveness of various therapeutic rationales and programs for narcotic addiction, including detoxification, maintenance on opioid drugs or opioid antagonists, and psychosocial management. Problems in interpreting evaluations and treatment outcomes are discussed, and the relative advantages of the 3 apparently most successful rehabilitation procedures (abstinence, narcotic antagonists, and the use of authority) are considered. (118 ref)

3661. Jansen, Donald R.; Brown, Barry S. & Bass, Urbane F. (Narcotics Treatment Administration, Washington, DC) **Comparison of attitudes and beliefs about methadone of clients retained and lost to treatment.** *Drug Forum*, 1974(Spr), Vol 3(3), 215-223.—40 addict clients retained in treatment 1 mo and 69 not retained were administered open-ended interviews and semantic differentials tapping attitudes regarding heroin and methadone. Attitude toward heroin was an effective predictor of retention in treatment beyond 1 mo. Retained clients became more favorable toward methadone in that 1st treatment month but limited the length of time they planned to remain on methadone. Moreover, time actually spent on methadone correlated with length of time expected to remain on methadone.—*Journal abstract.*

3662. Johnson, D. A. (Crumpsall Hosp, Manchester, England) **A study of the use of antidepressive medication in general practice.** *British Journal of Psychiatry*, 1974(Aug), Vol 125, 186-192.—Surveyed 3 separate groups of patients ( $n = 112, 82$ , and  $167$ , respectively) suffering from depression to evaluate the prescribing habits of a total of 104 general practitioners in the treatment of depression. An analysis of survey results suggests that psychotropic drugs were often used inappropriately in general practice. This view was confirmed by the opinions expressed by a group of

general practitioners who were questioned. The reasons for drug defaulting by patients were also explored. It is concluded that in the setting of urban general practice the potential for the traditional family doctor-patient relationship is strictly limited, and that in practice the interest in and knowledge of psychiatry and psychotropic drugs is relatively small.—*Journal summary.*

3663. Keegan, David L.; Pettigrew, Andrew & Parker, Zilla. (U Saskatchewan Hosp, Saskatoon, Canada) **Amitriptyline in the psychotic states of Down's syndrome: The comparison of two cases.** *Diseases of the Nervous System*, 1974(Aug), Vol 35(8), 381-383.—Describes 2 cases of psychosis associated with Down's Syndrome in a 23- and a 25-yr-old female where amitriptyline, a tricyclic antidepressant drug, was used successfully. Similarities between these cases and other psychotic disorders in Mongoloids are presented.

3664. Krakowski, Mark & Smart, Reginald G. (Addiction Research Foundation, Toronto, Ontario, Canada) **Social and psychological characteristics of heroin addicts dropping out of methadone treatment.** *Canadian Psychiatric Association Journal*, 1974(Feb), Vol 19(1), 41-47.—Describes characteristics of 53 male and 37 female heroin addicts, all over 21 yrs of age, in a methadone maintenance program. Patients who stayed in treatment for at least 1 yr were compared with those who dropped out. Ss remaining in treatment had a higher proportion who were married, who lived with spouse or children, and who were employed in white-collar jobs. Dropouts had records of more criminal charges before entering the program and had histories of heavier drug use. MMPI profiles of the dropouts evidenced more pathology than profiles of those staying in treatment.—*F. Auld.*

3665. Krippner, Stanley; Silverman, Robert; Cavallo, Michael & Healy, Michael. (Maimonides Medical Ctr, Brooklyn, NY) **Stimulant drugs and hyperkinesis: A question of diagnosis.** *Reading World*, 1974(Mar), Vol 13(3), 198-222.—Discusses the controversy surrounding the use of stimulant drugs in hyperkinetic children. 3 basic areas are discussed: the possibility of misdiagnosis, the question of adverse side effects of drugs, and the failure of authorities to examine nondrug alternatives in treating hyperkinetic children. Various definitions and symptoms of hyperkinetics are cited, and case histories of children diagnosed as hyperkinetic are presented. An experiment that compared 47 7-19 yr old hyperkinetic children (for whom medication had been prescribed) with 27 7-14 yr old nonhyperkinetic children is reported. Results of the experiment show that the 2 groups did not differ significantly on tests for brain dysfunction but did differ on tests for mental ability, creativity, and mental health. (57 ref)—*R. S. Albin.*

3666. Landsman, Richard. (COPAY, Inc, Great Neck, NY) **A pre-trial court diversion program for narcotics addicts: An alternative to incarceration.** *Drug Forum*, 1974(Spr), Vol 3(3), 295-306.—Describes a process which demonstrates that early identification and diversion away from the potential harmful effects of the criminal justice process will be beneficial in providing the addict with a source of rehabilitation as an alternative to incarceration. Intake, procedural, and aftercare techniques are described.

3667. **Lech-Sobczak, Andrzej.** [Neuroleptic treatment of prisoners with mental abnormalities.] (Polh) *Psychiatria Polska*, 1972(Sep), Vol 6(5), 563-567.—42 prisoners with mental abnormalities (psychopathy, character disorders, and mental debility) were given neuroleptics in daily doses of 50-200 mg: chlorpromazine (Fenactil), thioridazine, perazine, and triphenol. While the drugs had a beneficial influence on the Ss' general behavior, their effect was less marked in the spheres of affect, impulse, and psychomotor drive. Ss were reluctant to submit to systematic treatment because they believed the drugs to be harmful and observed that they did not produce the expected euphoria. (Russian summary)—*English summary*.

3668. **Lee, J. Hillary et al.** (Rockland State Hosp, Research Ctr, Orangeburg, NY) **Once versus thrice daily thiothixene in the treatment of schizophrenic in-patients.** *British Journal of Psychiatry*, 1974(Jul), Vol 125, 73-78.—Conducted a double-blind cross-over study of 38 chronic schizophrenic inpatients who received thiothixene either 1 or 3 times/day. Improvement over the placebo baseline occurred with both regimens, although improvement appeared somewhat earlier with the multiple doses. During the final maintenance phase, there was no difference between the treatment regimens. Extrapyramidal side effects were more marked with the multiple dosage regimen, although the difference was significant on only a few occasions. Issues involved in maintenance therapy for both in- and outpatients and recommendations for improved prescription compliance in outpatients are discussed. (21 ref)—*Journal summary*.

3669. **Levy, Norman M. & Tortelli, Joseph A.** (Renaissance Project, New Rochelle, NY) **Methadone dropouts in a drug free therapeutic community.** *Drug Forum*, 1974(Spr), Vol 3(3), 225-231.—Surveyed the 17 methadone dropouts from a population of 68 residents enrolled in a facility of a drug-free therapeutic community on a certain date. The great majority of dropouts continued drug abuse and diverted methadone illegally while on methadone programs. There was a short time interval between dropping out and involvement in the drug-free program. Dropping-out was probably related to a lack of sufficiently intense psychotherapy in methadone programs. It is concluded that ex-methadone patients are more sophisticated than the average resident and require an aggressive approach to rehabilitation.—*Journal abstract*.

3670. **Lofft, John G. & Demars, Jean P.** (Washington Hospital Ctr, DC) **A chemotherapeutic alternative to the anti-anxiety agents for the extended treatment of psychoneurosis.** *Diseases of the Nervous System*, 1974(Sep), Vol 35(9), 409-415.—Compared the effects of thioridazine and diazepam in 26 18-60 yr old patients with anxious or depressive neuroses, the majority of whom had histories of alcohol abuse. After a 2-wk drug washout period, Ss received either 20-200 mg of thioridazine or 4-40 mg of diazepam each day. The Hamilton Anxiety Scale and the Lipman Self-Rating Symptom Scale were completed at the beginning of the double-blind trial and 4 wks later. Results show that on the Hamilton scale, the 12 thioridazine Ss improved significantly more than the diazepam Ss on 15 items ( $p < .10$ ). These differences were confirmed when the

groups' pretrial vs 4-wk ratings were compared. Lipman data, however, show a strong trend favoring patients on diazepam. It is suggested that the behavioral manifestations of anxiety measured by the Hamilton scale are modified by thioridazine more than by diazepam, while the subjective feelings of relief from anxiety are more prominent and sustained with diazepam. It is concluded that thioridazine can effectively relieve tension and anxiety associated with psychoneurosis.—*L. Gorsey*.

3671. **Lukaszewicz, Andrzej; Komar, Januta & Tolwinski, Tomasz.** (Białymstok-Choroszczy Medical Academy, Clinic for Mental Diseases, Poland) [Experiences with chlormethiazol (Hemineurine).] (Polh) *Psychiatria Polska*, 1972(Sep), Vol 6(5), 551-556.—Studied the effects of chlormethiazole (Hemineurine) on 68 patients with various disorders (neurotic 16, depressive 25, psycho-organic 17, and other 10). Marked improvement of the mental state was observed in 31 Ss, moderate improvement in 28, and no improvement in 9. None of the cases showed complete remission of the morbid symptoms under the action of the drug. Its beneficial effects in insomnia of varying etiology, in anxiety states, and in psychomotor excitation were confirmed. It was less successful in states of psychomotor inhibition and in depressive syndromes, and still less successful with hypochondriacal symptoms. Its action was found to be only symptomolytic. (Russian summary)—*English summary*.

3672. **Martin, Roger D.** (U Saskatchewan, Saskatoon, Canada) **Reduction of adolescent drug abuse through post-hypnotic association.** *Canadian Counsellor*, 1974(Jun), Vol 8(3), 211-216.—Describes the treatment procedures used with 4 Indian-Metis and 2 white 14-16 yr old females who were involved in drug misuse. Ss were self-referrals for treatment because they were anxious and frightened because of adverse drug reactions. Treatment consisted of an initial comprehensive psychological examination and orientation interview, 3 intensive sessions of hypnosis where the Ss practiced and learned to develop cue association, and finally a procedure to develop cue association in situations where the Ss felt tense, anxious, and prone to drug misuse. Total number of sessions ranged from 6 to 15; a follow-up interview was conducted 6 mo later. In all cases it was found that drug misuse, as determined by interviews with the Ss and with significant people in their environment, had virtually stopped, although there was some mild use of alcohol. (French summary)—*Journal abstract*.

3673. **Mason, Aaron S. & Dewolfe, Alan S.** (VA Hosp, Downey, IL) **Usage of psychotropic drugs in a mental hospital: I. As needed (PRN) antipsychotic medications.** *Current Therapeutic Research*, 1974(Aug), Vol 16(8), 853-860.—Results of a survey of the use of PRN antipsychotic medication support the viewpoint that a large number of mental hospital physicians have not developed expertise in using antipsychotic agents in the most effective and economical manner. Only 38% of the 227 patients with PRN orders were receiving regular antipsychotic medication at greater than the conservative recommended moderate dosage level. Only 45% of the PRN orders called for intramuscular administration. Further analysis indicated that PRN orders are often both unnecessary and continued almost automatically.

In 33% of the cases, the PRN order had been in force for over 6 mo and 89% of the orders had been active for more than 1 mo. The original PRN order had been written for the patient by a previous physician in 36% of the cases. Staff physicians routinely continued PRN orders month after month without a critical review as to their need. 52% of the patients with active PRN orders resided on an open ward. In addition, 47% of the PRN orders had never been carried out. It is concluded that further research in the prescription practices of PRN antipsychotic agents is indicated.—*Journal abstract.*

3674. Mayer, Joseph & Black, Rebecca M. (Tufts U) **A description of some selected treatment approaches in alcohol abuse.** In J. G. Cull & R. E. Hardy (Eds), *Alcohol abuse and rehabilitation approaches*. Springfield, IL: Charles C Thomas, 1974. xiii, 203 p. \$12.75.—Discusses the necessity of utilizing different approaches in the treatment of alcoholism depending on the patient's level of social and economic functioning, social class, and depth of psychopathology. It is also pointed out that patients frequently require various approaches at the same time and at different times in their lives. (26 ref)

3675. McNair, Douglas M. (Boston U) **Self-evaluations of antidepressants.** *Psychopharmacologia*, 1974, Vol 37(4), 281-302.—Analyzes antidepressant clinical drug trials conducted from 1955 to 1972 to determine the most frequently used patient self-rating scales and to estimate their relative sensitivities (validities). Other analyses suggest how the methodology of the trials may have influenced measurement sensitivity. Interpretive problems are discussed, and some tentative recommendations are presented. (5 p ref)—*Journal abstract.*

3676. Mester, Roberto. **Psychiatrists' reactions to their patients' refusal of drugs.** *Israel Annals of Psychiatry & Related Disciplines*, 1972(Dec), Vol 10(4), 373-381.—The reactions of each of 6 psychiatrists (including the author) in a mental hospital to refusal by their patients of prescribed psychotropic drugs are described, classified, and analyzed in terms of motivation and effect on patients. Results indicate that refusal of the drug, which implied a rejection of the doctor himself, aroused aggressive impulses which formed the center of the motivational system underlying the reactions. These aggressive impulses could be ordered on an active-passive dimension. It is concluded that self-analysis by the doctor administering psychopharmacological treatment can help greatly in transforming his behavior into a useful instrument in the success of the chemical treatment.—*Journal abstract.*

3677. Milstein, Victor & Small, Joyce G. (Indiana U, Medical Ctr, Larue D. Carter Memorial Hosp, Indianapolis) **Photic responses in "minimal brain dysfunction."** *Diseases of the Nervous System*, 1974(Aug), Vol 35(8), 355-357.—Investigated the effect of a long-acting nomphetamine stimulant, magnesium pemoline, on the EEG recordings of 20 6-12 yr olds with hyperkinesia; controls were 10 normal children matched for age, sex, and grade level with 10 of the experimental Ss. The study was based on T. Shetty's hypothesis (see PA, Vol 48:11830) that the fundamental impairment in children with minimal brain damage is a disorder of inhibitory mechanisms in the central nervous system (CNS). Findings that photic driving did not decrease with the

stimulant drug contradict Shetty's results and suggest that drugs effective in the treatment of childhood hyperkinesia exert a stimulant effect upon the CNS. (17 ref)—*M. E. Pounsel.*

3678. Morgan, R. & Cheadle, J. (St Wulstan's Hosp, Malvern, England) **Maintenance treatment of chronic schizophrenia with neuroleptic drugs.** *Acta Psychiatrica Scandinavica*, 1974, Vol 50(1), 78-85.—Discusses the difficulties for the short-stay doctor of managing the drug treatment of long-stay schizophrenic patients. Some principles developed by the senior author to meet these difficulties are presented, and results of following the principles for 7 yrs are analyzed. Only 74 out of a population of 475 chronic schizophrenics had been considered suitable for trial without drugs. Only 5 of these still remained off drugs. The relapses of the other 69 patients occurred after an average of about 4½ months. Possible reasons for the widely different results of drug withdrawal trials are suggested. (15 ref)—*Journal abstract.*

3679. Mormont, C. (U Liege, Psychiatric Clinic, Belgium) **[Rating of psychological effects induced by "ordinary" Noveril and time-released Noveril.]** (Fren) *Psychopharmacologia*, 1974, Vol 37(4), 365-370.—Rated 2 groups of depressed inpatients (9 and 11 Ss) before, during, and after the study on 2 depression scales (Hamilton, Breulet), an anxiety scale (Cattell), and the MMPI. The Mann-Whitney U test was used to analyze statistically the results of the double-blind, cross-over, and randomized evaluation of the antidepressant characteristics of ordinary and of time-released Noveril (dibenzepin). Results confirm that both forms of Noveril are antidepressant, but that ordinary Noveril is more active.—*English abstract.*

3680. Nail, Richard L.; Gunderson, Eric & Arthur, Ransom J. (US Navy Medical Neuropsychiatric Research Unit, Drug Problems Branch, San Diego, CA) **Black-white differences in social background and military drug abuse patterns.** *American Journal of Psychiatry*, 1974(Oct), Vol 131(10), 1097-1102.—Studied drug-abuse patterns and social backgrounds of 833 US Navy enlisted men (764 white and 69 black) admitted to a drug rehabilitation center. Black Ss reported better school adjustment, less delinquency, and fewer difficulties in their home lives than did whites. They had used heroin more frequently than whites but were less involved with hallucinogenic drugs. It is suggested that different cultural patterns may underlie the drug-abuse behaviors of the 2 groups. White users seem to be expressing new varieties of delinquent or antisocial behavior, while blacks are following long-established subcultural patterns of drug use. (25 ref)—*Journal abstract.*

3681. Namyslowska, Irena. (Warsaw Medical Academy, Psychiatric Clinic, Poland) **[The influence of pharmacological treatment on schizophrenic associations.]** (Polh) *Psychiatria Polska*, 1972(Sep), Vol 6(5), 539-545.—Administered the Kent-Rosanoff Free Association Test to 77 schizophrenic patients before and after pharmacological treatment and compared the results with those of a control group of 80 randomly selected normal Ss. The mean number of individual responses in patients before treatment was 21, twice the number for

the normal Ss. Similarly, the mean association frequency (22.8) for patients before treatment was significantly lower ( $p < .01$ ) than for the control group (32.2). Following pharmacological treatment, the mean number of responses decreased significantly ( $p < .01$ ) to 14, and the mean association frequency increased significantly ( $p < .01$ ) to 32.4. The data support the hypothesis that association disorders respond favorably to pharmacological treatment and are not a permanent feature in the thinking of schizophrenic patients. (Russian summary)

—English summary.

3682. Nanry, Charles. (Rutgers State U) **Program evaluation: The use of content analysis.** *Drug Forum*, 1974(Spr), Vol 3(3), 233-238.—The content analysis of available pronouncements about the goals of a local drug abuse program is suggested as a means whereby conflicting definitions of purpose can be sorted out. Each definition of goals tends to create a collectivity of persons or groups who then see further program development as an implementation of those particular goals. (15 ref)

3683. Nelson, Arthur A. & Gagnon, Jean P. (U Illinois) **Physician acceptance of three proposed programs designed to reduce prescription prices.** *Drugs in Health Care*, 1974(Sum), Vol 1(1), 27-37.—Analyzes data from a national sample of 323 physicians who responded to a questionnaire on attitudes toward 3 programs for reduction of prescription drug prices: repeal of state antistubstitution laws, a federal formulary, and a community formulary. The hypothesis that physicians' attitudes toward these programs would be related to their perception of these prices as excessive was supported by the results.

3684. Palatucci, Donald M. (Neurodiagnostic Lab, San Francisco, CA) **Iatrogenic dyskinesia: A unique reaction to parenteral methylphenidate.** *Journal of Nervous & Mental Disease*, 1974(Jul), Vol 159(1), 73-76.—Reports the case of a psychiatric patient given 40 mg of methylphenidate intravenously who developed a severe dyskinetic reaction. Similar dyskinesias have been reported in rare instances in patients who have taken oral methylphenidate, but never previously in a patient who was given the drug intravenously. Some implications of this unique occurrence are discussed.

3685. Pazzaglia, Piero et al. (U Milan, Inst of Clinical Psychiatry, Italy) **[Modifications on the Rorschach test during psychopharmacological treatment of schizophrenic patients.]** (Ital) *Rivista di Psichiatria*, 1973, Vol 8(5), 498-508.—Compared the Rorschach psychograms of hospitalized schizophrenics before, during, and after various drug treatments. Rorschach patterns and clinical symptomatology were highly correlated.

3686. Pineda, Mario R. & Russell, Stanley C. (VA Ctr, Jackson, MS) **The use of a tricyclic antidepressant in epilepsy.** *Diseases of the Nervous System*, 1974(Jul), Vol 35(7), 322-323.—Reports the case of a 50-yr-old male with a known seizure disorder who developed an increased frequency of seizures associated with severe depression. When desipramine was added to the treatment regimen of phenobarbital and diphenylhydantoin, seizures markedly decreased and depressive symptomatology improved greatly.

3687. Pokorny, Alex D. & Prien, Robert F. (VA Hosp, Psychiatry Service, Houston, TX) **Lithium in treatment and prevention of effective disorder: A VA-NIMH collaborative study.** *Diseases of the Nervous System*, 1974(Jul), Vol 35(7), 327-333.—Describes a 4-yr study of (a) the effectiveness of lithium carbonate vs chlorpromazine in reducing manic symptoms over a 3-wk period; (b) the effectiveness of lithium vs placebo in preventing recurrence of affective episodes in manic patients over a 2-yr period; and (c) the relative effectiveness of lithium, imipramine, and placebo in preventing affective episodes in depressed patients over a 2-yr period. A total of 665 patients, including manics, schizo-affectives, and depressives, participated in the study. Rating scales included the Brief Psychiatric Rating Scale, the Inpatient Multidimensional Psychiatric Scale, the Psychotic Inpatient Profile, and self-reports of mood and side effects. Data on blood level effects, patient drop-outs, and optimal dosage levels are presented. Lithium carbonate appears to be a safe and effective treatment for preventing effective episodes in both unipolar and bipolar illnesses. For unipolar patients, however, imipramine was equally effective.

3688. Prien, Robert F.; Caffey, Eugene M. & Klett, C. James. (VA Hosp, Central Neuropsychiatric Research Lab, Perry Point, MD) **Factors associated with treatment success in lithium carbonate prophylaxis.** *Archives of General Psychiatry*, 1974(Aug), Vol 31(2), 189-192.—Conducted a multihospital collaborative study to evaluate prophylactic lithium carbonate therapy in 205 patients with bipolar manic-depressive illness. Factors associated with poor lithium carbonate response were the following: (a) a recent history of frequent affective episodes requiring hospitalization, and (b) previous failure of lithium carbonate treatment. Results also suggest that lithium carbonate response may be related to the presence of schizo-affective illness and a family history of bipolar affective illness, but the small numbers of patients in these groups limit interpretation. Most failures on lithium carbonate therapy occurred during the 1st year. Ability to remain on the maintenance schedule with no episodes for a year may be the most potent predictor of ultimate prophylactic success. There are important implications in these findings for the clinician selecting patients for prophylactic treatment. (22 ref)—*Journal abstract.*

3689. Rapoport, J.; Quinn, P.; Scribanu, N. & Murphy, D. L. (Georgetown U Hosp) **Platelet serotonin in of hyperactive school age boys.** *British Journal of Psychiatry*, 1974(Aug), Vol 125, 138-140.—Examined platelet serotonin content before and during treatment of 39 6-12 yr old hyperactive males with methylphenidate and imipramine. Ss were age-matched with 19 normal controls. Results show that imipramine treatment markedly reduced platelet serotonin, while methylphenidate had no similar effects. These findings suggest that since both drugs are clinically effective, it seems unlikely that change in serotonin transport or storage is closely related to the mechanisms of action of these drugs on hyperactive behavior.—*Journal summary.*

3690. Raskin, Allen. (NIMH Psychopharmacology Research Branch, Rockville, MD) **Age-sex differences in response to antidepressant drugs.** *Journal of Nervous &*

*Mental Disease*, 1974(Aug), Vol 159(2), 120-130.—Conducted 2 multihospital studies with a total of 880 patients in 4 age-sex groups who received 3-wk drug treatment with chlorpromazine, imipramine, and placebo in Study 1 and diazepam, phenelzine, and placebo in Study 2. Older males in both studies generally responded better to one of the active treatments than to a placebo. Older females were more selective and did well only on imipramine. Young females in Study 1 did well on placebo and poorly on imipramine, whose negative effects were primarily on the hostility variables. Response to a placebo by young males was negative in Study 1 and positive in Study 2, indicating that placebo response must be judged in the context of the active comparison drugs. Hostility was a serious problem for many young males and chlorpromazine relieved symptoms in this area. This was not true of either of the active drugs in Study 2. These results indicate that an analysis of sex differences alone could prove misleading, since there were as many differences in drug response between younger and older women and between younger and older men as there were between the sexes. Findings could be "explained" in terms of relationships among factors such as presenting symptoms, initial severity of illness, sensitivity to side effects, pharmacological action of the study drugs, and placebo response. (41 ref) —*Journal abstract*.

3691. Reed, Harvey D. & Janis, Irving L. (U Michigan) **Effects of a new type of psychological treatment on smokers' resistance to warnings about health hazards.** *Journal of Consulting & Clinical Psychology*, 1974(Oct), Vol 42(5), 748.—Hypothesized that if a person is induced to acknowledge his use of rationalizations for continuing a potentially dangerous activity (e.g., heavy smoking) before being given information refuting each rationalization, he will be less likely to use these cognitive defenses as effective forms of resistance when subsequently exposed to fear-arousing warnings about health risks he is taking. Data from 74 adults who sought aid in an anti-smoking clinic support the hypothesis.

3692. Rickels, Karl et al. (U Pennsylvania) **Thiothixene and thioridazine in anxiety.** *British Journal of Psychiatry*, 1974(Jul), Vol 125, 79-87.—Compared the effectiveness of thiothixene, thioridazine, and placebo in treating anxiety in 155 anxious neurotic outpatients. 96 patients completed at least 4 wks of treatment with 6 mg doses of thiothixene and 75 mg of thioridazine daily. Thioridazine produced the most and placebo the least amount of side effects. Significant trends for both active drugs to produce more improvement than placebo appeared after 2 wks of treatment but not after 4 or 6 wks. Even at the 2-wk period, however, treatment differences were somewhat less than those usually observed with anti-anxiety agents. It is suggested that this may be due to the tendency for physicians to assign more treatment-resistant patients to trials involving antipsychotic agents than to those involving anti-anxiety agents. While the initial level of anxious and overall neurotic psychopathology had no differential effect on treatment outcome, the initial level of secondary depression had a mild effect, with both drugs producing more improvement in the initially high than in the initially low depressed patients. (17 ref)—*Journal summary*.

3693. Rucker, T. Donald. (Ohio State U) **Public policy considerations in the use of psychotherapeutic drugs.** *Drugs in Health Care*, 1974(Sum), Vol 1(1), 5-15.—Critiques industry practices related to the use of brand names and promotional techniques. The establishment of a nationally coordinated information system where computer technology would be used to help improve the quality of professional decision making is urged. Characteristics of a model organization for providing continuing professional education, the potential role of placebo and nondrug inputs in treating patient conditions, and health education for patients are discussed. (29 ref)

3694. Runciman, Alexander P. & Doyle, E. Lee. **Orgasmic problems: A counseling demonstration.** In R. E. Hardy & J. G. Cull (Eds), *Therapeutic needs of the family: Problems, descriptions and therapeutic approaches*. Springfield, IL: Charles C Thomas, 1974. xv, 240 p. —Presents a panel discussion/interview between a psychiatrist, sociologist, marriage counselor, and 2 actors who play the role of a couple in which the wife is nonorgasmic. Within the transcript, stages in the couple's recognition of other underlying problems and conflicts, suggestions for therapists, and the steps in the therapeutic adjustment process are detailed.

3695. Rybakowski, Janusz. (Poznań Medical Academy, Psychiatric Clinic, Poland) **[Lithium carbonate in endogenous depression.]** (Polh) *Psychiatria Polska*, 1972(Sep), Vol 6(5), 547-550.—Administered lithium carbonate in daily doses of 900-1,500 mg for 20 days to 8 women patients with endogenous depression (4 unipolar, 4 in the course of manic-depressive illness). All unipolar patients showed complete clinical remission. Of the bipolar patients, 3 were improved, 1 was unchanged. Findings suggest that lithium is likely to be useful in the treatment of depression. (Russian summary) (16 ref) —*English summary*.

3696. Sakalis, George; Sathananthan, Gregory; Collins, Patrick & Gershon, Samuel. (New York U, Medical Ctr, Neuropsychopharmacology Research Unit) **SQ 65,396: A non-sedative anxiolytic?** *Current Therapeutic Research*, 1974(Aug), Vol 16(8), 861-864.—10 psychiatric inpatients manifesting moderate to severe anxiety were treated openly with SQ-65,396, a potent adenosine 3', 5' monophosphate phosphodiesterase inhibitor, up to a maximum dose of 50 mg 4 times daily. At the end of the study, a significant reduction in anxiety was observed, whereas schizophrenic symptomatology continued to worsen. None of the patients showed any side effects. It was decided on these findings to start a double-blind study in patients suffering from anxiety states.—*Journal abstract*.

3697. Saraf, Kishore R.; Klein, Donald F.; Gittelman-Klein, Rachel & Groff, Stephen. (Hillside Hosp, Glen Oaks, NY) **Imipramine side effects in children.** *Psychopharmacologia*, 1974, Vol 37(3), 265-274.—Compared the incidence, range, and severity of side effects in 65 6-14 yr old school phobic and hyperkinetic children receiving imipramine treatment with those occurring in 37 others receiving placebo. Minor side effects occurred in 83% of the imipramine group and in 70% of the placebo group. Just under 5% of the Ss in the imipramine group had significant side effects but none were serious enough to necessitate drug withdrawal. The majority of side effects

in both groups occurred during the 1st 3 wks of treatment. However, there may be serious individual idiosyncrasies to high dosage of imipramine, as possibly suggested by the sudden death of 1 6-yr-old girl during imipramine treatment. (30 ref)—*Journal abstract*.

3698. Sathananthan, G.; Shopsin, B. & Peterson, B. (New York U, Medical School, Neuropsychopharmacology Research Unit) **The effects of lithium carbonate on serum gastrin in psychiatric patients.** *Acta Psychiatrica Scandinavica*, 1974, Vol 50(1), 86-89.—The effect of lithium treatment on the gastrin level in serum was tested on 4 patients with different psychiatric diagnoses. All patients showed normal serum values during the 1st 3 wks of the treatment period. Possible reasons for the relatively unelevated levels of serum gastrin are discussed. (23 ref)

3699. Smulevitch, A. B.; Zavidovskaya, G. L.; Igonin, A. L. & Mikhailova, N. M. (USSR Academy of Medical Sciences, Inst of Psychiatry, Moscow) **The effectiveness of lithium in affective and schizo-affective psychoses.** *British Journal of Psychiatry*, 1974(Jul), Vol 125, 65-72.—Presents findings on the effectiveness of lithium sulfate in 100 patients who received the drug for more than 1 yr. Data were compared with those from 100 control patients not receiving lithium. Of the 100 patients treated with lithium, 50 were diagnosed as having manic-depressive psychoses, 49 as having schizophrenic affective disorders, and 1 as having periodic relapses of affective phases in an organic syndrome of the central nervous system (meningo-encephalitis). Lithium-treated patients exhibited significant reductions in the overall number of affective phases and in the number of days of illness compared with the controls. Treatment failures were most evident in cases of affective and schizoaffective psychoses, while successes were most evident in manic-depressive illnesses. Dosage considerations and the effects of lithium on psychopathological features and progression of the illness are discussed. (30 ref)—*L. Gorsev*.

3700. Spring, Gottfried K. (Case Western Reserve U) **Hazards of lithium prophylaxis.** *Diseases of the Nervous System*, 1974(Aug), Vol 35(8), 351-354.—Presents 2 cases, that of a 20- and a 45-yr-old woman, where severe intoxication with prophylactic lithium occurred, illustrating the potential hazards of using the drug indiscriminately. Symptoms, mechanisms, and successful medical management of lithium toxicity are also described. (16 ref)

3701. Swett, Chester. (Boston Collaborative Drug Surveillance Program, Waltham, MA) **Drowsiness due to chlorpromazine in relation to cigarette smoking: A report from the Boston Collaborative Drug Surveillance Program.** *Archives of General Psychiatry*, 1974(Aug), Vol 31(2), 211-213.—Compared the frequency of drowsiness attributed to orally administered chlorpromazine hydrochloride among 130 nonsmokers, 201 light smokers (20 cigarettes or less/day), and 72 heavy smokers (more than 20 cigarettes/day). All Ss were psychiatric patients (mean age = 36 yrs). Drowsiness occurred in 16, 11, and 3%, respectively. More rapid metabolism of chlorpromazine in cigarette smokers may explain these findings.—*Journal abstract*.

3702. Tansella, Michele; Zimmermann-Tansella, Christa & Lader, Malcolm. (Istituto di Clinica Psichiatrica di Verona, Italy) **The residual effects of N-desmethyldiazepam in patients.** *Psychopharmacologia*, 1974, Vol 38(1), 81-90.—Treated 60 10-63 yr old anxious-neurotic inpatients complaining of insomnia with 10 or 20 mg of N-desmethyldiazepam, 200 mg of amylobarbitone sodium, or placebo, given at night. The hypnotic effects of these treatments were assessed by self-rating, psychiatrists' ratings, and night nurses' observations after 1 night's treatment and after a week of treatment, and compared with pretreatment values. The residual effects of the treatments were estimated 12 hrs after ingestion using a series of cognitive and motor tasks. No significant differences between the treatments were found after 1 night. After the week of treatment, the benzodiazepine groups were achieving the best quality of self-rated sleep with fewest subjective feelings of hangover. Some improvement in performance was found over time for all groups. However, on 2 motor tests, the higher dose of N-desmethyldiazepam was associated with less improvement (i.e., some impairment relative to placebo was detected). (15 ref)—*Journal abstract*.

3703. Toomim, Marjorie K. **Separation counseling: A structured approach to marital crisis.** In R. E. Hardy & J. G. Cull (Eds), *Therapeutic needs of the family: Problems, descriptions and therapeutic approaches*. Springfield, IL: Charles C Thomas, 1974. xv, 240 p.—Describes the rationale and principles of separation counseling which attempts to use the separation crisis to maximize growth and self-understanding. Couples commit themselves to a 3-mo period during which they agree to certain rules which stress the values of choice, risk, and honesty. Emphasis is placed on both individuals' reaction to separation, their personality structures, and their evolving relationship.

3704. van Praag, H. M. (U Groningen, Netherlands) **Therapy-resistant depressions: Biochemical and pharmacological considerations.** *Psychotherapy & Psychosomatics*, 1974, Vol 23(1-6), 169-178.—Investigated whether a central monoamine (MA) deficiency occurs in depressive patients, and whether, if this disorder is present in only a proportion of the patients, this can explain the apparent selectivity of antidepressants in the sense that MA-deficient patients benefit particularly from this type of therapy. A review of the research shows that, in depressive patients the cerebral MA turnover can be diminished. These disorders do not occur in all patients but seem to be confined to certain categories of depression. Diminution or nondiminution of the central MA turnover is a (not the) factor which determines whether antidepressant medication will succeed or fail. (21 ref)—*Journal abstract*.

3705. Vista Hill Psychiatric Foundation. (San Diego, CA) **Darvon N: Its role in opiate addiction.** *Drug Abuse & Alcoholism Newsletter*, 1974(Mar), Vol 3(1), 4 p.—Describes the pharmacology of propoxyphene hydrochloride (Darvon) and propoxyphene napsylate (Darvon N) and the history and characteristics of their abuse. Detoxification of heroin addicts with Darvon N and its role as a maintenance agent are discussed, and side effects and special considerations in the administration

of these drugs to treat opiate-dependent persons are examined.

3706. Vore, David A. & Wright, Logan. (U Oklahoma, Health Sciences Ctr, Children's Memorial Hosp) **Psychological management of the family and the dying child.** In R. E. Hardy & J. G. Cull (Eds), *Therapeutic needs of the family: Problems, descriptions and therapeutic approaches*. Springfield, IL: Charles C Thomas, 1974. xv, 240 p.—Presents suggestions for clinicians for understanding and managing the stages of conceptualization of death and the needs expressed by both the dying child and his family. Examples of pathology which sometimes occur in families with dying children are presented, and various counseling techniques that can be used with both the children and their families are described.

3707. Wächter, H. M. & Leuner, H. (U Göttingen, Psychiatric Clinic, W Germany) [Short-term psychotherapy of a male drug user with the *Katathymen Bilderleben* (Unterstufe).] (Germ) *Praxis der Kinderpsychologie und Kinderpsychiatrie*, 1974(Apr), Vol 23(3), 81-88.—Reports the case of an 18-yr-old male user of hallucinogenic drugs treated with 15 sessions of a guided affected imagery daydreaming technique. Improvement was shown on clinical test scales. A 6-mo follow-up showed abstinence, improved tolerance toward frustrations, and improved social adjustment. (16 ref)

3708. Wheatley, David. (General Practitioners Research Group, Twickenham, England) **Viloxazine: A new antidepressant.** *Current Therapeutic Research*, 1974(Aug), Vol 16(8), 821-828.—Assessed 4 daily dose levels of viloxazine—120, 200, 240, and 300 mg—in 77 depressed patients treated for 4 wks. Similar results were recorded with all 4 dose schedules, there being no statistically significant differences on 3 measures (physicians rating scales, patient self-assessment, or global ratings) at any period of the trial. Findings are similar to those recorded with tricyclic antidepressants. An important advantage for viloxazine was apparent in the fact that there was only 1 case of drowsiness at 3 days only and only 3 cases of dry mouth. However, on the 2 higher doses, nausea occurred fairly frequently and necessitated omission of treatment in a number of cases. It is concluded that the optimum dose for treating ambulant patients at home is 200 mg daily.—*Journal abstract*.

3709. Wilmarth, Stephen S. & Goldstein, Avram. (Addiction Research Foundation, Palo Alto, CA) **Therapeutic effectiveness of methadone maintenance programs in management of drug dependence of morphine type in the USA.** Geneva, Switzerland: World Health Organization, 1974. 53 p.—Discusses the pharmacology of methadone and the rationale of methadone maintenance, government regulations over methadone maintenance, and 3 selected methadone programs—those in New York City, Chicago, and Santa Clara County, California. Outcome analyses of methadone use are detailed. (8 p ref)

3710. Wilson, Byron K.; Elms, Roslyn R. & Thomson, Captane P. (California Dept of Public Health, Mental Health Services Div, Woodland) **Low-dosage use of methadone in extended detoxification: An experimental comparison.** *Archives of General Psychiatry*, 1974(Aug), Vol 31(2), 233-236.—Studied 30 18-57 yr old heroin addicts to examine the effects of methadone hydrochloride

given in low dosages in extended narcotic detoxification. Treatment procedures were divided into 2 phases, extending over 90 days. Initial phase (7-10 days) included both hospital and outpatient supervision and was terminated when addicts were reduced to a 10-mg dose of methadone. The 2nd phase of treatment was conducted exclusively on an outpatient basis and double-blind techniques were employed. Results show that few patients became drug-free and most soon returned to heroin use. No significant differences were found between treatment modalities, and the data do not suggest that hospital treatment affected the results of a 90-day treatment program.—*Journal abstract*.

3711. Wittenberg, Diana. (Roosevelt Hosp, New York, NY) **Art therapy for adolescent drug abusers.** *American Journal of Art Therapy*, 1974(Jan), Vol 13(2), 141-149.—Discusses the art program in a residential drug treatment center in New York City, describing how it was integrated into the general therapy and overall programs at the center. The possibilities for further use of art in this kind of therapy are considered.

3712. Woodrow, Kenneth M. (VA Hosp, Palo Alto, CA) **Gilles de la Tourette's disease: A review.** *American Journal of Psychiatry*, 1974(Sep), Vol 131(9), 1000-1003.—Describes the characteristics and symptoms of Gilles de la Tourette's disease, and suggests that the disorder may be behaviorally related to schizophrenia and biochemically related to the amphetamine psychosis. The treatment of choice is haloperidol. (45 ref)

3713. Zakowska-Dabrowska, Teresa & Strzyzewski, Wlodzimierz. (Poznań Medical Academy, Psychiatric Clinic, Poland) [The action of Noveril on bioelectric brain activity.] (Poln) *Psychiatria Polska*, 1972(Sep), Vol 6(5), 523-528.—Studied 27 patients with diagnoses of endogenous depression who were treated with dibenzepin (Noveril). The EEG changes occurring in the course of treatment with this drug did not differ from those occurring during treatment with other thymoanaleptics (e.g., imipramine). These changes consisted chiefly of synchronization of alpha activity, intensification of morphological changes existing prior to treatment, occurrence of paroxysmal potentials, and slow activity. EEG changes indicating "sensitivity" of the bioelectric brain activity to the action of the drug seem to be a favorable prognostic sign during treatment with dibenzepin. (Russian summary) (16 ref)—*English summary*.

### Behavior & Group Therapy

3714. Allen, Jon G. (Northern Illinois U) **Implications of research in self-disclosure for group psychotherapy.** *International Journal of Group Psychotherapy*, 1973(Jul), Vol 23(3), 306-321.—Reviews the literature on self-disclosure (SD) in group psychotherapy and emphasizes its importance in the therapeutic process. The paper-and-pencil measure of SD, developed by S. M. Jourard (1958), and its variants, are described. Patterns of SD vary as a function of individual, relationship, and situational factors. There is substantial regularity in what people are willing to disclose and the most probable recipients of disclosure. The SD process, methodological issues, and its implications for group psychotherapy are summarized. (50 ref)—*R. S. Albin*.

3715. **Berger, Lynne F. & Berger, Milton M.** A holistic group approach to psychogeriatric outpatients. *International Journal of Group Psychotherapy*, 1973(Oct), Vol 23(4), 432-444.—Re-examines previous attempts at group psychotherapy with geriatric patients. The development of a new approach, in a group involving 8 outpatients, is described. The goals, selection criteria, procedures, and results of the program are detailed. (18 ref)

3716. **Braswell, Michael.** The problem inmate: An adjustment process. *Southern Journal of Educational Research*, 1974(Spring), Vol 8(4), 292-300.—Designed and implemented an adjustment process for unmanageable inmates in a maximum security prison. The process provides a behavioral program for "problem" inmates with special emphasis on behavior management training for correctional officers. Program results based on the 1st 8 wks of data collection indicate that the adjustment process is successful to a significant degree.—*Journal abstract*.

3717. **Brown, R. Michael & Brown, Norma L.** (U North Carolina, Chapel Hill) The increase and control of verbal signals in the bladder training of seventeen month old child: A case study. *Journal of Child Psychology & Psychiatry & Allied Disciplines*, 1974(Apr), Vol 15(2), 105-109.—Attempted to increase systematically the frequency and accuracy of verbal signaling of urination in a 17-mo-old female child by means of operant procedures. Results show that when the reinforcing contingencies were present, signal frequency and accuracy increased above baseline level.

3718. **Brown, Ronald E.; Copeland, Rodney E. & Hall, R. Vance.** (U Kansas) School phobia: Effects of behavior modification treatment applied by an elementary school principal. *Child Study Journal*, 1974, Vol 4(3), 125-133.—Used systematic reinforcing and shaping procedures successfully to modify an 11-yr-old school-phobic boy's intense fear of the classroom. The procedure resulted in a significant improvement in the S's attendance record. The treatment conditions consisted of the S's earning tickets for himself and his mother to a professional football game, contingent upon his meeting the set criterion for daily attendance. The S was reinforced first for being in the library and hall or classroom then for being in the classroom only. A changing criterion design was used to demonstrate that the reinforcing and shaping procedures, applied by the principal, were responsible for the student's improvement in daily attendance.—*Journal abstract*.

3719. **Conrad, Rex D.; Delk, John L. & Williams, Cecil.** (U Arizona) Use of stimulus fading procedures in the treatment of situation specific mutism: A case study. *Journal of Behavior Therapy & Experimental Psychiatry*, 1974(Jul), Vol 5(1), 99-100.—An 11-yr-old American Indian child who had never spoken a word in a reservation classroom during the entire 5 yrs of her schooling was treated using stimulus fading procedures. Success of treatment was enhanced by reinforcing the desired verbal behavior in several situations which successively approximated the classroom setting, and by the use of an indigenous mental health worker who successfully served as a positive stimulus and reinforcer. A 1-yr follow-up showed that the girl continued to

respond verbally to her teacher in routine classroom interactions.—*Journal abstract*.

3720. **Cox, Murray.** (Broadmoor Hosp, Crowthorne, England) Group psychotherapy as a redefining process. *International Journal of Group Psychotherapy*, 1973(Oct), Vol 23(4), 465-473.—Suggests that self-definition occurs within group situations and redefinition takes place either spontaneously or as part of psychotherapeutic strategy within a group context. The theory underlying this process is based on the sociological interactionist perspective. The concept of the value-free therapist is criticized, and it is stated that the relevant question to ask is what value system actually operates. Group therapy has advantages over individual therapy in terms of the shared here-and-now experience and also in terms of the social class distance between therapist and patient. It is suggested that the group is of particular value in treating people who are regarded as social outcasts.—*Journal summary*.

3721. **Cull, John G. & Hardy, Richard E.** (Eds.). (Virginia Commonwealth U, School of Community Services) Group work with distressed families. In R. E. Hardy & J. G. Cull (Eds), *Therapeutic needs of the family: Problems, descriptions and therapeutic approaches*. Springfield, IL: Charles C Thomas, 1974. xv, 240 p.—Describes aspects of group marital counseling, including marital roles that may surface during counseling, relationships necessary for effective group interaction, ground rules for group marital sessions, time requirements, and types of sessions. The role of the group leader and problems which may be encountered in the course of the sessions are also examined.

3722. **Daniels, Lloyd K.** (Central Connecticut State Coll) Rapid extinction of nail biting by covert sensitization: A case study. *Journal of Behavior Therapy & Experimental Psychiatry*, 1974(Jul), Vol 5(1), 91-92.—Describes a case of chronic compulsive nail-biting in a 23-yr-old male undergraduate treated by covert sensitization. 2 1-hr treatment sessions resulted in complete cessation of the nail-biting.

3723. **Davidson, William S.** (U Illinois) Studies of aversive conditioning for alcoholics: A critical review of theory and research methodology. *Psychological Bulletin*, 1974(Sep), Vol 81(9), 571-581.—Reviews studies of the applications of aversive conditioning procedures to alcoholics. The review is divided into sections on electrical and chemical aversive stimulation and is organized according to the level of research design used. While many positive outcomes are reported, inconsistent theoretical underpinnings of the research are also reported. The lack of systematic investigation of relationships between therapist, patient, and technique characteristics indicate the need for further investigation. The ethics of using the techniques reviewed with human Ss are discussed. (62 ref)—*Journal abstract*.

3724. **Davis, Harry K. & Dorman, Kenneth R.** (U Texas, Medical Branch, Galveston) Group therapy versus ward rounds. *Diseases of the Nervous System*, 1974(Jul), Vol 35(7), 316-319.—Describes the effectiveness of an open-ended group therapy program for psychiatric inpatients compared to the traditional ward rounds by staff therapists. The therapy groups included both patients and staff psychiatrists and residents and

were based on supportive, semidirective principles to encourage open discussions of problems. The composition of the groups by diagnosis of personality problems is described for the initial 9-mo trial period. 7 advantages of the group therapy program are discussed, including the opportunities for the patients and professionals to have more exposure to each other and for observing potential problem behavior patterns. 4 disadvantages are identified, including a decrease in one-to-one contacts between patients and therapists. It is concluded that observations of small group processes among psychiatric patients are an effective addition to methods of assessing a patient's current mental status.—*L. Gorsey.*

3725. Denney, Douglas R. (U Kansas) **Active, passive, and vicarious desensitization.** *Journal of Counseling Psychology*, 1974, Vol 21(5), 369-375.—Studied 2 variations of desensitization therapy for reducing test anxiety: active desensitization in which the client describes his visualizations of the scenes and vicarious desensitization in which the client merely observes the desensitization treatment of another test-anxious client. 48 undergraduates with high scores on the Test Anxiety Scale (I. G. Sarason, 1972) were assigned to 1 of 6 groups. Active, passive, active-vicarious, and passive-vicarious desensitization groups were compared with relaxation and untreated control groups. Ss were given a battery of pre- and posttreatment measures assessing intelligence and anxiety (e.g., the Fear Survey Schedule). For measures on which desensitization had a significant effect, no significant differences were discovered between either direct and vicarious or active and passive forms of desensitization. The relaxation treatment which emphasized application of one's relaxation skills was effective. (19 ref)—*Journal abstract.*

3726. Foster, Carol. (Camelot Behavioral Systems, Bureau of Child Research, Parsons, KS) **Developing self-control.** Kalamazoo, MI: Behaviordelia, 1974. vii, 135 p. \$4.25.—Presents a programed text on principles of self-reinforcement and behavior modification. Methods of changing, measuring, and maintaining behavior changes and designing self-control programs are described. (22 ref)

3727. Foster, S. E. (Mt Gravatt Teachers' Coll, Brisbane, Qld, Australia) **Use of behaviour modification techniques in behaviour training of severely and profoundly retarded children.** *Slow Learning Child*, 1974(Mar), Vol 21(1), 24-37.—Discusses the techniques used by researchers to modify behavior problems of the severely and profoundly retarded. Unfortunately, it is punishment which seems to have had some measure of success when severe self-injurious behavior has been involved. Mild and moderate punishment has been found ineffectual if there were no alternate responses which would produce reinforcement. Severe punishment suppressed a response totally and for a long time, inhibited other responses, and increased frequency of response if it produced reinforcement. Aggressive behavior, including self-inflicted wounds, is dealt with by technological innovations, environmental alterations, and other means. Training methods sometimes used are said to be either too lenient or too cruel, but no one workable system has yet been established.—*C. L. Nicholson.*

3728. Galassi, John P.; Galassi, Merna D. & Litz, M. Carol. (U North Carolina, School of Education, Chapel Hill) **Assertive training in groups using video feedback.** *Journal of Counseling Psychology*, 1974, Vol 21(5), 390-394.—Investigated the effectiveness of group assertive training with 16 male and 16 female college students who were nonassertive (as measured by the College Self-Expression Scale, Galassi et al, 1974). Ss were assigned randomly to 2 experimental and 2 control groups. Experimental Ss received 8 training sessions consisting of videotape modeling; behavior rehearsal; video, peer, and trainer feedback; bibliography; homework assignments; trainer exhortation; and peer-group support. All Ss were posttaped enacting role-playing situations. Significant differences were found between experimental and control Ss on the College Self-Expression Scale, the Subjective Unit of Disturbance Scale, eye contact, length of scene, and assertive content, but not on response latency. Significant pretest effects were evident for several of the behavioral dependent variables. (15 ref)—*Journal abstract.*

3729. Gold, Vivian J. (Mt Zion Hosp, Crisis Clinic, San Francisco, CA) **Dreams in group therapy: A review of the literature.** *International Journal of Group Psychotherapy*, 1973(Oct), Vol 23(4), 394-407.—Reviews the 1950-1972 literature on dreams in group therapy and discusses the possibilities raised by such studies. Various clinical approaches to dreams brought up in group therapy suggest ways to help patients become aware of unconscious aspects of themselves. Theoretical questions have been raised regarding the occurrence of a "group dream" distinguishable from other dreams. Some dreams brought into group therapy may help to elucidate covert, affective group processes involving the entire group. The study of dream content in relation to a therapy group is one approach to studying the relationship between dreams and waking life. The basis for bonds within the group may also be studied through the group dream. It is hoped that other studies will be carried on dealing with the interplay between the group setting and the dreams of its members. (45 ref)—*I. Davis.*

3730. Gottwald, P. et al. [Behavioral therapeutic experiments to improve speech construction and social behavior in a schizophrenic child: Limits of the effects of reinforcement and generalization of punishment effect.] (Germ) *Zeitschrift für Klinische Psychologie*, 1973, Vol 1(2), 1-26.—Studied the case history of a 12-yr-old girl with early childhood schizophrenia to obtain data concerning the improvement of abstract speech by behavior conditioning and modification; the effects of punishment on psychotic behavior, and generalization possibilities; the build-up of social behavior and the importance of a number of "free" variables such as emotional reactions, eye contact, etc. For 9 mo 4 behavioral therapists recorded abnormal and modified behavior during sessions of speech training, social behavior training, and combined training. During a short period of the verbal training, psychotic behavior was punished by one of the therapists. Results are discussed in detail. Food reinforcement was valuable for improving behavior. Punishment proved effective in suppressing psychotic behavior, with a limited generalization of punishment effects. Language training was effective with

pronouns but not with prepositions. Improvements during training sessions did not generalize to daily behavior on the psychiatric ward. It is concluded that social training rather than speech training should be the therapeutic goal and that the use of punishment is questionable. (English summary) (15 ref)—*T. Fisher.*

3731. **Graessner, Dietrich & Bastine, Reiner.** (U Hamburg, Psychological Inst, W Germany) [Experience with group training and systematic desensitization in the treatment of smokers: A critical report.] (Germ) *Zeitschrift für Klinische Psychologie*, 1973, Vol 1(2), 64-74.—Studied modification of smoking habits in 24 male students with an average daily consumption of 15-30 cigarettes, all eager to cooperate and reduce their consumption rate. Ss were divided into 2 groups of 12, one treated by negative group practice and the other by systematic desensitization. 5 Ss of the 1st group and 7 of the 2nd completed the experiment. In Group 1, 1 wk of negative practice with minimal therapeutic contact reduced consumption by about 80%, and 6 wks after completing the treatment the reduction was 50%. In Group 2, 7 wks of desensitization therapy with intensive therapeutic contacts reduced consumption by about 50%, and 5 wks later the reduction was still about 50%. Results are analyzed and the merits of the 2 systems are compared. (English summary) (16 ref)—*T. Fisher.*

3732. **Hardy, Richard E. & Cull, John G. (Eds.).** (Virginia Commonwealth U) *Therapeutic needs of the family: Problems, descriptions and therapeutic approaches.* Springfield, IL: Charles C Thomas, 1974. xv, 240 p.

3733. **Himle, David P. & Shorkey, Clayton.** (U Michigan) *The systematic desensitization of a car phobia and the recall of a related memory.* *Journal of Biological Psychology*, 1973(Dec), Vol 15(2), 4-7.—Presents the case study of a 35-yr-old severe car phobic. The phobia was successfully treated with the use of systematic desensitization procedures incorporating methohexital as a relaxing agent. In vivo techniques were used to assess the results of treatment and to enhance transfer to treatment to the natural environment. A simulation of the phobic situation was used in place of the traditional desensitization hierarchy. Clinical implications of the case are discussed.—*Journal abstract.*

3734. **Hutzell, Robert R.; Platzek, Denna & Logue, Patrick E.** (Florida State U, Human Development Clinic) *Control of symptoms of Gilles de la Tourette's syndrome by self-monitoring.* *Journal of Behavior Therapy & Experimental Psychiatry*, 1974(Jul), Vol 5(1), 71-76.—Treated an 11-yr-old male, diagnosed as having Gilles de la Tourette's syndrome, by self-monitoring therapy. A 5-step procedure of successively refined control was employed. Symptom emissions were decreased both in the therapeutic setting and in the natural environment. Control was demonstrated through employment of a multiple-baseline design. Follow-up sessions conducted 1.5 and 12 mo after the termination of therapy indicated that the symptom behavior rate remained lowered in the therapeutic setting. Reports from the S's parents and teachers indicated that the symptom behavior rate had decreased to zero in the natural environment.—*Journal abstract.*

3735. **Ingram, Gilbert L.** (Federal Correctional Inst, Tallahassee, FL) *Families in crisis.* In R. E. Hardy & J. G. Cull (Eds), *Therapeutic needs of the family: Problems, descriptions and therapeutic approaches.* Springfield, IL: Charles C Thomas, 1974. xv, 240 p.—Briefly reviews historical trends in the behavior of families and methodological issues in studies of the relationship between delinquency and family structure and atmosphere. Parental contributions to delinquency are discussed, and suggestions for working with hostile or inadequate families or those with an already incarcerated delinquent are presented. (3½ p ref)

3736. **Inutsuka, T. & Mike, D.** (Hizen National Mental Hosp, Kyushu, Japan) [The application of behavior therapy to chronic schizophrenics: I.] (Japn) *Kyushu Neuro-psychiatry*, 1971(Dec), Vol 17(3-4), 137-145.—Reports the results of operant conditioning and aversive therapy applied to severely regressed female chronic schizophrenic patients. 7 patients treated by operant conditioning showed distinct improvement in a relatively short time, while 2 patients treated by aversive therapy did not. Operant conditioning was effective not only in modifying unwanted behavior but also in helping Ss acquire new adaptive behavior, expand life space, increase interpersonal contacts, and diminish and extinguish abnormal experiences. It also permits the nursing staff to easily maintain a systematic and consistent approach to the patients, which can itself achieve effective results. (English summary) (23 ref)—*S. Ashida.*

3737. **Johnson, James H. & Thompson, Daniel J.** (U Texas, Medical Branch, Div of Child Psychiatry, Galveston) *Modeling in the treatment of enuresis: A case study.* *Journal of Behavior Therapy & Experimental Psychiatry*, 1974(Jul), Vol 5(1), 93-94.—Reports the successful treatment of enuresis in a 5-yr-old boy in which filial modeling procedures, accidentally introduced by the mother and later included as part of the treatment program, are thought to have played a major role.

3738. **Kahn, Aman U.; Staerk, M. & Bonk, C.** (Northwestern U, Medical School) *Role of counter-conditioning in the treatment of asthma.* *Journal of Psychosomatic Research*, 1974(Apr), Vol 18(2), 89-92.—Assessed the effectiveness of "conditioned bronchodilation" as a treatment for asthmatic attacks. 20 asthmatic children 8-16 yrs old were given a counterconditioning treatment which involved the instigation of bronchial constriction followed by training in bronchial dilation through biofeedback reinforcement. Results indicate that the improvement in the experimental group as a whole was significantly greater than in the control group. Instrumental learning appears to be related to the conditioning of certain emotional reactions (e.g., fear of separation or feeling of rejection). (18 ref)—*W. G. Shipman.*

3739. **Kaplan, Helen S. et al.** (Cornell U, Medical Coll, New York) *Group treatment of premature ejaculation.* *Archives of Sexual Behavior*, 1974(Sep), Vol 3(5), 443-452.—Treated 4 heterosexual couples, in which premature ejaculation by the male was the chief sexual complaint, in a group setting. Therapy was based on the idea that the premature ejaculator does not perceive sensations premonitory to orgasm and therefore does not

learn control of the ejaculatory reflex. 2 couples were successfully treated in 6 45-min group sessions, and 2 gained successful ejaculatory continence 2 mo later. At 4 mo followup, all 4 couples reported continued and improved sexual functioning. Therapist time average was 1.5 hrs for each couple.—*Journal abstract.*

3740. Kaplan, Seymour R. (Albert Einstein Coll of Medicine, Yeshiva U) **The "group dream."** *International Journal of Group Psychotherapy*, 1973(Oct), Vol 23(4), 421-431.—Describes the characteristics of some dreams reported by patients in group therapy. Two dreams and the group processes they represent are discussed. (22 ref)

3741. Kaufman, Gershen & Krupka, Judy. (Michigan State U, Counseling Ctr) **Integrating one's sexuality: Crisis and change.** *International Journal of Group Psychotherapy*, 1973(Oct), Vol 23(4), 445-464.—Describes a sexual therapy group program at the counseling center of a state university, aimed at the treatment of youthful individuals experiencing sexual dysfunction and conflict. Included are the methods of screening and selecting group members, an analysis of the dropouts, the rules for the groups, moral and ethical issues and the goals of therapy, characteristics of the groups, the value of male-female therapist teams, and an assessment of the changes attributable to the program. The interpersonal processes which produce sexual dysfunction are discussed: deprivation, permission and guilt, power struggles, hostility, expectations, and adequacy and potency.—R. S. Albin.

3742. Kennedy, Thomas D. & Kimura, Harry K. (Arizona State U, Ctr of Criminal Justice) **Transfer, behavioral improvement, and anxiety reduction in systematic desensitization.** *Journal of Consulting & Clinical Psychology*, 1974(Oct), Vol 42(5), 720-728.—Studied the degree of transfer and fear change associated with 4 levels of desensitization, pseudodesensitization, and no treatment in 74 female snakephobic undergraduates. Only Ss desensitized to 75% or more of the hierarchy demonstrated reliably greater reductions in avoidance behavior than controls. However, Ss completing 50% or less of the hierarchy showed smaller transfer decrements than those who finished the hierarchy. Results also suggest that repeated exposure tends to improve transfer efficiency. On the posttest, desensitization Ss reported significantly less anxiety than no-treatment controls when repeating their highest pretreatment responses, but were no different from either control group when performing new approach responses, suggesting that behavioral improvement is not dependent upon the elimination or inhibition of conditioned emotional arousal. (23 ref)—*Journal abstract.*

3743. Kessler, Sheila. (Georgia State U, Counseling Ctr) **Treatment of overweight.** *Journal of Counseling Psychology*, 1974, Vol 21(5), 395-398.—18 motivated 19-41 yr old participants who responded to an advertisement concerning the formation of a weight reduction group were divided randomly into 3 groups: (a) a control group; (b) Treatment 1, involving the application of learning theory plus group therapy; and (c) Treatment 2, involving the same principles as Treatment 1 plus mutual help principles. Both treatment groups lost significantly more weight over a 7-wk period than did the control

group, but little difference existed between the 2 treatment groups.—*Journal abstract.*

3744. Kilmann, Peter R. (U South Carolina) **Direct and nondirect marathon group therapy and internal-external control.** *Journal of Counseling Psychology*, 1974, Vol 21(5), 380-384.—Investigated whether direct and nondirect therapist techniques within a 23-hr marathon format would differentially induce client shifts in locus of control (as measured by Rotter's Locus of Control Scale). Ss were 84 female narcotic addicts. The no-treatment control group experienced a significant shift toward externality, while the marathon Ss did not fluctuate significantly from pre- to posttherapy. No significant difference in shift was found between the direct and nondirect treatment conditions. A significant Periods  $\times$  Locus of Control  $\times$  Treatment Conditions interaction showed that internal Ss in the direct and control conditions shifted significantly toward externality. Future studies need to investigate whether a posttherapy shift in locus of control is associated with changes on other personality measures. (17 ref)—*Journal abstract.*

3745. Krishna, Ajay; Singh, S. B. & Srivastav, J. R. (GSVM Medical Coll, Kanpur, India) **Behaviour disorders in children: Causes and cure: A Horney theory approach.** *Child Psychiatry Quarterly*, 1974(Apr), Vol 7(2), 1-10.—Treated 50 2-4 yr old children in a child guidance clinic in India. Organic basis was ruled out for each disturbance and operant levels were measured at the start of treatment. 2 sorts of problems were encountered: external stress manifestations (e.g., tantrums and stealing) and internal manifestations (e.g., stammering and vomiting). Techniques used included withdrawal of reinforcing factors, relaxation, aversion, modeling, reward, conditioning, and desensitization. In the 1st group of problems, the cure rate was 100%, while in Group 2 it was 88%. (22 ref)—R. S. Albin.

3746. Lambley, Peter. (U Cape Town, S Africa) **Treatment of transvestism and subsequent coital problems.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1974(Jul), Vol 5(1), 101-102.—Established successful heterosexual behavior in a 26-yr-old male transvestite by means of rewards for heterosexual imagery and planned heterosexual encounters. Subsequently, erectile failure was eliminated by use of a series of graded in vivo exposures, and orgasmic failure by orgasmic reconditioning.

3747. Lambley, Peter. (U Cape Town, South Africa) **Differential effects of psychotherapy and behavioural techniques in a case of acute obsessive compulsive disorder.** *British Journal of Psychiatry*, 1974(Aug), Vol 125, 181-183.—Evaluated the effects of various behavioral methods and psychotherapy in the treatment of a female undergraduate. Results suggest that covert reinforcement may have some advantages over other techniques in the acute phase of an obsessive-compulsive disorder, since it allows the patient to develop self-control over the impulses that create the acute condition.

3748. Lewis, Phillip & McCants, Jane. (U Georgia) **Some current issues in group psychotherapy research.** *International Journal of Group Psychotherapy*, 1973(Jul), Vol 23(3), 268-278.—Outlines the crucial issues and a tentative framework for future research in group psychotherapy, which is not merely a more complex version

of individual psychotherapy. One important task of the researcher is to specify and manipulate important variables unique to the group situation. The problem of evaluating, in the group psychotherapy setting, the influence of broad variables derived from the literature on group dynamics is discussed in detail. Relevant variables and research approaches are described. A model of group psychotherapy as interpersonal learning is provided. (29 ref)—*R. S. Albin.*

3749. Litrownik, Alan J. (San Diego State U) **A method for home training an incontinent child.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1974(Jul), Vol 5(1), 77-80.—Describes a home training method for incontinent children utilizing a signal apparatus. Effective toilet training was accomplished through simple conditioning procedures using an auditory signal apparatus in a profoundly retarded 7-yr-old male for whom traditional training methods had failed. These procedures involved pairings of first the buzzer and running to the bathroom, and then bladder distension and the buzzer. After a number of such pairings the child began to indicate when his bladder was distended. This served as a cue for the parents to prompt the appropriate toileting response. Independent toileting behavior was effected within a 7-wk period and maintained over a 5-mo follow-up with generalization to new situations.—*Journal abstract.*

3750. Lovaas, O. Ivar & Bucher, Bradley D. (Eds.). (U California, Los Angeles) **Perspectives in behavior modification with deviant children.** Englewood Cliffs, NJ: Prentice-Hall, 1974. xiii, 562 p.

3751. Lovaas, O. Ivar; Schaeffer, Benson & Simmons, James Q. (U California, Los Angeles) **Building social behavior in autistic children by use of electric shock.** In O. I. Lovaas & B. D. Bucher (Eds), *Perspectives in behavior modification with deviant children.* Englewood Cliffs, NJ: Prentice-Hall, 1974. xiii, 562 p.—Describes 3 experimental investigations carried out on 2 5-yr-old identical twins diagnosed as childhood schizophrenics with pronounced autistic features. The studies show that electric shock modified their reluctance to approach adults and eliminated pathological behaviors such as self-stimulation and tantrums. Social behavior and affection toward adults increased after the adults had been associated with shock reduction.

3752. Lubin, Bernard & Lubin, Alice W. (U Missouri, Medical School, Kansas City) **The group psychotherapy literature: 1972.** *International Journal of Group Psychotherapy*, 1973(Oct), Vol 23(4), 474-513.—Summarizes the 1972 group therapy literature under the following headings: (a) group psychotherapy (past, present and future; problems and techniques; training, cotherapy and supervision; psychoanalytic group psychotherapy; and transactional analysis; psychodrama, sociodrama and role-playing; Gestalt training and therapy; group treatments derived from learning theory; and group counseling, group discussion, and group work); (b) client populations (inpatients; outpatients; community groups and self-help groups; family therapy; marital therapy and couples therapy; children; adolescents; addictive behavior; mentally retarded; crime and delinquency; special problems; racial and ethnic issues; and leaderless groups); (c) intensive small group experiences; and (d)

research (group psychotherapy; transactional analysis; and intensive small group experiences). (500 ref)—*Journal abstract.*

3753. Marvit, Robert C.; Lind, Judy & McLaughlin, Dennis G. (Hawaii State Dept of Health, Mental Health Div, Honolulu) **Use of videotape to induce attitude change in delinquent adolescents.** *American Journal of Psychiatry*, 1974(Sep), Vol 131(9), 996-999.—Use of videotape techniques in the treatment of antisocial attitudes in 44 Hawaiian adolescents was most effective in allowing increased reality testing coincident with reduced use of denial. This effect was enhanced with support provided through the peer-group process.

3754. Mash, Eric J. (U Calgary, Alberta, Canada) **Has behaviour modification lost its identity?** *Canadian Psychologist*, 1974(Jul), Vol 15(3), 271-280.—Considers the current identity of behavior modification from a recent historical perspective. An examination is made of the identity changes occurring during the evolution of behavior modification, from academic operant psychology to a treatment approach concerned with socially important behaviors. It is pointed out that changes taking place over this time period have resulted in a lack of clarity concerning what behavior modification is, and that several possible resolutions for this lack of clarity could occur. Recommendations are made for an identity characterized by the application of experimental analysis to treatment endeavors based upon a wide range of theoretical constructs, rather than treatment based solely upon a conditioning model. (French abstract) (15 ref)—*Journal abstract.*

3755. McLachlan, John F. (Donwood Inst, Toronto, Ontario, Canada) **Therapy strategies, personality orientation and recovery from alcoholism.** *Canadian Psychiatric Association Journal*, 1974(Feb), Vol 19(1), 25-30.—74 male and 20 female alcoholic inpatients received 26 hrs of group therapy for 3 wks in a group conducted by 1 of 5 therapists. Patients and therapists were assigned conceptual level ratings based on responses to D. E. Hunt's paragraph-completion test. 12-16 mo after treatment, staff members rated the patients on changes in drinking behavior. It was expected that patients with low conceptual levels would need a more directive therapist and that those of high conceptual level would need a more nondirective therapist. Patients whose conceptual level matched that of their therapist had better outcome (70% recovered) than those who were mismatched (50% recovered). Aftercare matching was also related to recovery: matched patients (high conceptual levels with out-of-town care and low levels with in-town care) showed a 71% recovery rate, while mismatched patients showed a 49% recovery rate.—*F. Auld.*

3756. Miller, Peter M.; Hersen, Michel & Eisler, Richard M. (VA Ctr, Jackson, MS) **Relative effectiveness of instructions, agreements, and reinforcement in behavioral contracts with alcoholics.** *Journal of Abnormal Psychology*, 1974(Oct), Vol 83(5), 548-553.—Evaluated the effects of the components of behavioral contracting on drinking in 40 chronic alcoholics. Ss were divided into 4 groups matched on age, education, length of problem drinking, and initial operant drinking responses. They were then exposed to 1 of the following conditions: (a) verbal instructions to limit alcohol

consumption, (b) signed written agreement to limit consumption, (c) verbal instructions plus reinforcement for compliance, and (d) signed agreement plus reinforcement. Pre- and postoperant analog drinking sessions, in which leverpressing was reinforced with alcohol on a fixed ratio reinforcement schedule, served to assess effects of the experimental conditions. Results indicate that while instructions and signed agreements had limited influence on drinking, both groups receiving reinforcement for compliance significantly decreased their operant drinking.—*Journal abstract.*

3757. Moxnes, Paul. (U Oslo, Norway) **Verbal communication level and anxiety in psychotherapeutic groups.** *Journal of Counseling Psychology*, 1974, Vol 21(5), 399-403.—Hypothesized a linear relationship in psychotherapeutic groups between verbal behavior (defined as the level of communication) and experienced anxiety. However, trained judges' ratings of 6 2-hr tape-recorded group sessions revealed a curvilinear relationship between these 2 variables. The maximum level of anxiety occurred on the border of communication of private and unknown-self material. When communication increased above these levels, the anxiety tended to decrease. This is explained in terms of S. Epstein's 1967 finding that bodily arousal and experienced anxiety increase progressively to a certain stimulus intensity level. Then, with still increasing stimulus intensity, the bodily arousal and physiological anxiety will continue to increase while the experienced anxiety will tend to decrease because of the intervention of certain inhibitory mechanisms. (17 ref)—*Journal abstract.*

3758. Norton, Robert; Feldman, Charles & Tafoya, Dennis. (U Michigan) **Risk parameters across types of secrets.** *Journal of Counseling Psychology*, 1974, Vol 21(5), 450-454.—Developed a content analysis system to examine the frequency of themes for 359 written secrets obtained anonymously from 359 undergraduates in an encounter group exercise. Sex-related secrets occurred most often, followed by failure-related secrets. A stratified, random sample of 49 secrets was drawn. 190 other undergraduates then rated the levels of risk associated with various secrets. Secrets ranged from the risky, "I have had incestuous relations with a member of my family," to the nonrisky, "I smoke dope." Secrets relating to sex, mental health, and violence or destruction were perceived as the most risky statements.—*Journal abstract.*

3759. Orwin, Arnold. (Hollymoor Clinic, Regional Behaviour Research Unit, Birmingham, England) **Treatment of a situational phobia: A case for running.** *British Journal of Psychiatry*, 1974(Jul), Vol 125, 95-98.—Describes the treatment of specific situational phobia (of high-level lavatory cisterns) in a 24-yr-old woman by using the autonomic excitation caused by vigorous muscular anxiety as an inhibitor of the situational anxiety. The near-lifelong phobia was removed in 5 short sessions with little psychiatric involvement.

3760. Peshkin, M. M. & Abramson, H. A. **Psychosomatic group therapy with parents of children with intractable asthma: IV. The Saul family.** *Journal of Asthma Research*, 1974(Mar), Vol 11(3), 127-138.—Includes excerpts from transcribed discussions during therapy with the parents of an asthmatic boy, demon-

strating the interaction between therapists and family members and describing the emotional climate in the home which might have led to the intractability of the asthmatic syndrome.

3761. Pipineli-Potamianou, A. **Listening to the family interplay: A parent-child interview.** *International Journal of Group Psychotherapy*, 1973(Jul), Vol 23(3), 338-345.—Presents and analyzes an interview with a father, a mother, and their 5-yr-old son. The boy's problems are discussed. The mother's hysterical structure and her rejection of the child are considered in relation to the father's ambivalence toward his son. The role of the therapist, a third party intervening in this situation, is described. Emphasis is placed on the need to understand the demands of all those involved in the therapy situation.—*R. S. Albin.*

3762. Rasbury, Wiley C. (U Florida, Shands Teaching Hosp) **Behavioral treatment of selective mutism: A case report.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1974(Jul), Vol 5(1), 103-104.—Describes an in vivo desensitization program designed to reinstate normal verbal communication in an 11-yr-old girl who was selectively mute for approximately 6 yrs. Contrary to traditional desensitization therapy, the procedure was conducted within the context of the patient's everyday environment, and used the emotional effects of positive reinforcement as the postulated reciprocal inhibitor of fear.

3763. Redmond, Daniel P.; Gaylor, Michael S.; McDonald, Robert H. & Shapiro, Alvin P. (U Pittsburgh, Medical School, Div of Hypertension & Clinical Pharmacology) **Blood pressure and heart-rate response to verbal instruction and relaxation in hypertension.** *Psychosomatic Medicine*, 1974(Jul), Vol 36(4), 285-297.—Instructed 6 hypertensive patients to alternately raise (up) and lower (down) their blood pressure by concentrating on changing heart rate, force of contraction, and blood vessel resistance to flow. Paired 10-min periods were separated by the E's entry and exit. 5 Ss were taught progressive muscular relaxation (PMR), and the immediate cardiovascular response was studied in both the presence and absence of the E. Systolic and diastolic blood pressure (BP) and heart rate (HR) were measured every 30 sec in all sessions. Direction of changes in BP and HR for up and down periods was appropriate and significant in both instruction sessions, and BP differences frequently reached significant levels of magnitude. PMR uniformly lowered BP and HR, but was of significant magnitude only when induction of PMR involved active participation by the E. Interviews revealed considerable dramatic mental imagery associated with directional shifts in BP. Results indicate that directional instruction may result in appropriate changes in BP and HR of a magnitude comparable to those reported in studies using external biofeedback. PMR did not alter the response. This study supports other data indicating that "placebo" effects may operate in conditioning studies. (33 ref)—*Journal abstract.*

3764. Richardson, Frank C. & Suinn, Richard M. (U Texas, Austin) **Effects of two short-term desensitization methods in the treatment of test anxiety.** *Journal of Counseling Psychology*, 1974, Vol 21(5), 457-458.—2 short-term desensitization methods, accelerated massed

desensitization and anxiety management training, were compared with standard systematic desensitization in terms of reducing self-reported test anxiety in 44 high test-anxious undergraduates. Posttreatment scores on the Suinn Test Anxiety Behavior Scale indicate that all 3 treatment procedures significantly reduced test anxiety as compared with a waiting-list control group. However, self-reported anxiety following treatment for the anxiety management training group was higher than for the standard desensitization and accelerated massed desensitization groups, and the standard desensitization procedure was significantly more effective than anxiety management training. Anxiety management training, a general or nonspecific program for anxiety control, reduced test anxiety with just 1 hr of direct training in counteracting anxiety. It did not, however, reduce other salient fears as measured by scores on a fear survey schedule.—*Journal abstract.*

3765. Ritchie, Agnes M. & Serrano, Alberto C. (Community Guidance Ctr, San Antonio, TX) *Family therapy in the treatment of adolescents with divorced parents.* In R. E. Hardy & J. G. Cull (Eds), *Therapeutic needs of the family: Problems, descriptions and therapeutic approaches.* Springfield, IL: Charles C Thomas, 1974, xv, 240 p.—Describes the use of multiple impact therapy (MIT) for emotionally disturbed adolescents of divorced parents. MIT requires at least 2 therapists and includes both individual and family sessions aimed at recognizing and assessing family roles, patterns of communication, and interactions. 4 patterns of family functioning are described, and several case examples are presented.

3766. Robinson, Luther D. & Weathers, Olethia D. (St Elizabeths Hosp, Washington, DC) *Family therapy of deaf parents and hearing children: A new dimension in psychotherapeutic intervention.* *American Annals of the Deaf*, 1974(Jun), Vol 119(3), 325-330.—Describes a 6-mo joint therapeutic effort by a psychiatrist and a psychiatric social worker with a family in which both parents were deaf and mute. The family was referred for treatment by a pediatrician when the 10-yr-old middle child of 3 developed bizarre eating habits followed by life-threatening weight loss. The therapists used a combination of manual language (sign language and finger spelling) and the spoken word as the medium of communication. The treatment goals were accomplished. The ability of mental health professionals to intervene in cases where special communication skills are necessary is discussed.—*C. K. Miller.*

3767. Rosenberg, Jerome. (New Coll, U Alabama) *Counseling the parent of the chronic delinquent.* In R. E. Hardy & J. G. Cull (Eds), *Therapeutic needs of the family: Problems, descriptions and therapeutic approaches.* Springfield, IL: Charles C Thomas, 1974, xv, 240 p.—Examines the concept of chronic delinquency and procedures for assessing the role of the parent in a particular family situation. 3 models of intervention are described: (a) a support model in which the therapist helps the parents adjust to the particular problems presented by their child, (b) a change intervention model in which the parents learn to alter significantly their relationship with the child, and (c) a dual intervention model in which the parents learn basic skills to work more effectively with their child. (2 p ref)

3768. Ross, Joel A. (Hofstra U) *The use of contingency contracting in controlling adult nailbiting.* *Journal of Behavior Therapy & Experimental Psychiatry*, 1974(Jul), Vol 5(1), 105-106.—A 33-yr-old woman agreed to contribute money to a strongly disliked organization for failure to increase fingernail length. Nail-biting was discontinued for the duration of the contingency contract and a follow-up 3 and 6 mo later indicated that the increase in nail length was maintained.

3769. Ross, Steven M. (VA Hosp, Drug Dependence Treatment Ctr, Salt Lake City, UT) *Behavioral group therapy with alcohol abusers.* In J. G. Cull & R. E. Hardy (Eds), *Alcohol abuse and rehabilitation approaches.* Springfield, IL: Charles C Thomas, 1974, xxi, 203 p. \$12.75.—Offers behavioral therapy as a method of treating alcoholism. Pre-group preparations and group meetings are structured so that they can be used regardless of individual theoretical orientations. Techniques and definitions of relevant behavioral terms are also included. (15 ref)

3770. Scher, Maryonda. (U Washington, Medical School) *Observations in an aftercare group.* *International Journal of Group Psychotherapy*, 1973(Jul), Vol 23(3), 322-337.—Describes the processes and functioning of an open-ended aftercare group in which therapists worked with patients discharged from a psychiatric hospital. The group purposes were (a) to assist patients in their return to the community, (b) to train psychiatric residents in small-group therapy, (c) to demonstrate small-group therapy to appropriate students, and (d) to study small-group processes and gather pertinent research data. Over a 10-yr period the group held 557 sessions with a total of 230 patients; individual sessions had 6-12 members. Patients' reasons for attendance and absence, patient turnover, therapist changes, and duration of participation are discussed.—*R. S. Albin.*

3771. Schulman, Michael. (Fordham U, Lincoln Ctr Campus) *Control of tics by maternal reinforcement.* *Journal of Behavior Therapy & Experimental Psychiatry*, 1974(Jul), Vol 5(1), 95-96. Reports the case of a 14-yr-old boy whose multiple tics appeared to be maintained by his mother's response to them. Social contingency therapy directed at removing the mother's attention led to the tics being successfully eliminated in about 3 mo. In 2 subsequent months the tics had to some extent returned, in association with renewed attention to them by the mother.—*Journal abstract.*

3772. Schulte, Dietmar. (U Munster, Psychological Inst, Div of Clinical Psychology, W Germany) [Behavioral therapy and phobic anxiety: Development of therapy methods.] (Germ) *Zeitschrift für Klinische Psychologie*, 1972, Vol 1(1), 64-78. Discusses behavioral literature, theory, research, and therapy concerning phobic anxiety. The approach to phobic anxiety as a form of respondent behavior, the lack of extinction due to operant escape and avoidance behavior, and the method of systematic dissolution of the stimulus-response (S-R) connection in order to attain desensitization are described briefly. The frequent failure of the desensitization process (in about 40% of patients) is blamed on the circumstance that phobic anxiety is also maintained by positive social reinforcers. Therapy, in order to be successful, must combine extinction of the S-

R connection through systematic desensitization with an operant extinction therapy. (English summary) (36 ref) —T. Fisher.

3773. Shaw, David W. & Thoresen, Carl E. (Ohio State U) **Effects of modeling and desensitization in reducing dentist phobia.** *Journal of Counseling Psychology*, 1974, Vol 21(5), 415-420.—Notes that although many persons avoid dentists and dental work, counseling techniques that eliminate dental avoidance behavior and reduce stress have not yet been systematically examined. The present study explored the effects of systematic desensitization and social-modeling treatments with placebo and assessment control groups. Each of the 4 groups contained 9 dental-phobic adults (mean age = 30 yrs). A behavioral measure as well as several attitude and fear arousal scales (e.g., the Fear Survey Schedule) were used as dependent variables. Modeling was more effective than desensitization as shown by the number of Ss who went to a dentist, and modeling and desensitization were more effective in reducing arousal and improving attitudes than placebo and assessment groups. The importance of demonstrating behaviors coupled with covert practice, or self-modeling, is discussed. (24 ref) —*Journal abstract.*

3774. Shorkey, Clayton & Himle, David P. (U Texas, Austin) **Systematic desensitization treatment of a recurring nightmare and related insomnia.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1974(Jul), Vol 5(1), 97-98.—Treated a case of a recurring nightmare and related insomnia in a 38-yr-old male chronic paranoid schizophrenic by systematic desensitization, using methohexital (Brevital) as the relaxing agent. A portion of the nightmare was treated as a simple phobia. The nightmare and insomnia disappeared after 11 treatment sessions. 4 weekly interviews following the termination of treatment and subsequent 6-mo and 2-yr assessment interviews revealed no evidence of the recurrence of the nightmare or insomnia.—*Journal abstract.*

3775. Sperling, Eckhard. (U Göttingen, Psychiatric Clinic, Div of Psycho- and Sociotherapy, W Germany) **[Family therapy methods: Meaning, hopes and problems.]** (Germ) *Praxis der Psychotherapie*, 1973(Apr), Vol 18(2), 82-89.—Reviews the 9 family therapy methods of N. Ackerman.

3776. Stahl, J. R.; Thomson, Laurence E.; Leitenberg, Harold & Hasazi, Joseph E. (U Vermont) **Establishment of praise as a conditioned reinforcer in socially unresponsive psychiatric patients.** *Journal of Abnormal Psychology*, 1974(Oct), Vol 83(5), 488-496.—Studied the establishment of social praise as a reinforcer for clinically relevant behaviors in 3 socially unresponsive Ss: a 46-yr-old male catatonic schizophrenic, a 17-yr-old male obsessive-compulsive neurotic, and a male catatonic schizophrenic hospitalized for 19 yrs. A within-S multiple baseline design was employed. During an initial baseline period, praise was not effective in modifying the behavior of any S. The contiguous association of social praise with token reinforcement served to enhance the reinforcing properties of praise, establishing praise as an effective modifier of the target behaviors. (18 ref) —*Journal abstract.*

3777. Thomson, Nancy; Fraser, Douglas & McDougall, Alexander. (Kings Coll, Aberdeen, Scotland) **The reinstatement of speech in near-mute chronic schizophrenics by instructions, imitative prompts and reinforcement.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1974(Jul), Vol 5(1), 83-89.—Studied the effectiveness of instruction supplemented by imitative prompts with speech-contingent reinforcement in the reinstatement of speech in 2 very withdrawn chronic schizophrenics. The 2 patients, aged 60 and 61 yrs, were drawn from a pool of chronic schizophrenics described as mute by ward staff. Ss were informed what response was required, and imitative prompts were supplied where necessary. Reinforcement was contingent upon adequate speech. Reinstatement of speech was rapid and effective. Reinforcement, while effective in reinstating speech, was not necessary for its maintenance.—*Journal abstract.*

3778. Turnage, John R. & Logan, Daniel L. (North Texas State U) **Treatment of a hypodermic needle phobia by in vivo systematic desensitization.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1974(Jul), Vol 5(1), 67-69.—Describes the successful treatment of a hypodermic needle phobia in a 27-yr-old female in 10 sessions, using in vivo systematic desensitization. It is suggested that this treatment is well-suited to the alleviation of pain when the experience of pain is compounded by fear and anxiety.

3779. Welgan, Peter R. (Orange County Dept of Mental Health, Newport Beach, CA) **Learned control of gastric acid secretions in ulcer patients.** *Psychosomatic Medicine*, 1974(Sep-Oct), Vol 36(5), 411-419.—Conducted 2 experiments to train increases in the pH of gastric acid secretions in peptic ulcer patients. In Exp I, in the presence of pH feedback, 10 Ss showed significant increases in pH of gastric acid secretions, while acid concentration and volume of secretions significantly declined. When feedback was subsequently withheld, no significant changes appeared in these measures. A 2nd study then tested if initial changes following the basal period were experimental effects. In Exp II 10 Ss were divided into 2 groups—1 group received no feedback after a basal condition, while a 2nd group received feedback after the basal condition. Results show that significant increases in pH and decreases in acid concentration and volume occurred only after the onset of pH feedback. Results suggest that gastric acid secretions may be altered and controlled with the appropriate feedback. (23 ref)—*Journal abstract.*

3780. Westlake, Robert J.; Levitz, Leonard S. & Stunkard, Albert J. (Butler Hosp, Outpatient Div, Providence RI) **A day hospital program for treating obesity.** *Hospital & Community Psychiatry*, 1974(Sep), Vol 25(9), 609-611.—Describes a day hospital program used to treat obese patients which includes actual meal preparation and group behavior therapy. Average weight loss was 14 lbs at the end of 10 wks. A 6-mo follow-up showed that patients either continued to lose or maintained their weight loss.

3781. Whitman, Roy M. (U Cincinnati, Medical School) **Dreams about the group: An approach to the problem of group psychology.** *International Journal of Group Psychotherapy*, 1973(Oct), Vol 23(4), 408-420.—Presents examples of 6 dreams of patients, 5 of whom

were in individual therapy and simultaneously exposed to a group situation of an emotionally involving nature. The 1st 2 dreams dealt with the group's unique affect-mobilizing ability by its own valence. The middle 2 dealt with the group as it activated memories of the family of origin and current participation. The last 2 dealt with the earliest developmental sequence, the relationship with the mother on both narcissistic and object-love levels. Each of these dreams offered primary-process glimpses into the individual's empathic perception of the group and added to the knowledge of that individual, and often of the group to which he was responding. (22 ref)  
—*Journal summary.*

3782. Wickramasekera, Ian. (U Illinois, Coll of Medicine, Peoria) **Heart rate feedback and the management of cardiac neurosis.** *Journal of Abnormal Psychology*, 1974(Oct), Vol 83(5), 578-580.—Describes the treatment of a 55-yr-old male with chronic cardiac neurosis who had failed to respond to several prior medical and psychological interventions. Significant and durable symptomatic response appeared to be correlated with the application of a combination of procedures including heart-rate feedback, patient-administered desensitization, and therapist-administered flooding.—*Journal abstract.*

3783. Wickramasekera, Ian. (U Illinois, Medical School) **Hypnosis and broad-spectrum behavior therapy for blepharospasm: A case study.** *International Journal of Clinical & Experimental Hypnosis*, 1974(Jul), Vol 22(3), 201-209.—Describes the apparently successful treatment of a 45-yr-old white female with blepharospasm (severe eye-blink tic) which had not responded to the analytic psychotherapy previously attempted. The dynamics and etiology of the symptoms seemed clear to the previous therapist, present therapist, and the patient. Combining hypnosis and behavior therapy in a manner calculated to strengthen the ego appears to have been the critical therapeutic intervention. (German summary)—*Journal abstract.*

3784. Wiltz, N. A. & Gordon, S. B. (U Washington, Clinical Training Unit) **Parental modification of a child's behavior in an experimental residence.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1974(Jul), Vol 5(1), 107-109.—Used an apartment-like setting with observational facilities to train the parents of a 9-yr-old hyperactive, aggressive boy in the application of behavioral principles. The entire family lived in this setting for 5 consecutive days, receiving training by instructional materials, prompting, modeling, and feedback. They then returned home and maintained contact by telephone. There were significant reductions in the child's rate of noncompliance and in destructive acts towards people and property.—*Journal abstract.*

3785. Wodarski, John S.; Feldman, Ronald A. & Flax, Norman. (Jewish Community Ctr Assn, Group Integration & Behavioral Change Project, St Louis, MO) **Social learning theory and group work practice with antisocial children.** *Clinical Social Work Journal*, 1973(Sum), Vol 1(2), 78-93.—Presents a theoretical framework for behavior modification principles and delineates the ways in which these principles can be useful for establishing relationships within groups of antisocial children. Positive reinforcement, time-out procedures, shaping, and

stimulus generalization are discussed. Emphasis is placed on the therapist's structuring group contingencies, rather than individual contingencies within the group.—S. R. Stein.

3786. Wooden, Howard E. (Katherine Hamilton Mental Health Ctr, Terre Haute, IN) **The use of negative practice to eliminate nocturnal headbanging.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1974(Jul), Vol 5(1), 81-82.—Used negative practice to eliminate long-standing head-banging during sleep in a 26-yr-old male, a behavior which seemed to increase during periods of stress and anxiety. Results support the idea that a crucial variable in negative practice is the aversive property of the discomfort associated with having carried out the head-banging behavior in excess. The generalization of the effects of negative practice from waking to sleeping is discussed.—*Journal abstract.*

3787. Yulis, Sergio et al. [Systematic desensitization in phobic patients: An evaluation.] (Span) *Acta Psiquiátrica y Psicología de América Latina*, 1974(Feb), Vol 20(1), 46-50.—Used objective measures and subjective reports of the therapeutic change to evaluate the therapist's role in systematic desensitization (SD) outcome. 60 spider-phobic Ss were exposed to (a) SD administered by a permanent therapist, (b) SD with a different therapist at each therapeutic session, (c) tape-recorded SD, or (d) no treatment (control group). The objective measures did not show statistically significant differences among the 3 experimental groups, but all 3 evidenced a significant therapeutic gain compared to the control group.—*English summary.*

### Psychoanalysis

3788. Giovacchini, Peter L. **Character disorders: Form and structure.** *International Journal of Psychoanalysis*, 1973, Vol 54(2), 153-160.—Describes 2 aspects of patients with characterological disorders: (a) the patient's primitive preverbal fixations which allow the therapist to contribute to the patient's psychopathology as he attempts to conceptualize psychic mechanisms and ego defects in secondary process terms, and (b) the specific type of ego defect encountered in such patients which leads to a need for reassurance that they are capable of being helped, although they prove to themselves the hopelessness of such a pursuit. Such patients are not easily understood and the problems arising from misinterpretation are discussed.—*Journal summary.*

3789. Kestenberg, Judith S. **Psychoanalytic contributions to the problem of children of survivors from Nazi persecution.** *Israel Annals of Psychiatry & Related Disciplines*, 1972(Dec), Vol 10(4), 311-325.—Mailed questionnaires to child psychoanalysts in Europe, Israel, the US, and Canada to obtain data on their experiences in treating the children of survivors of Nazi persecution. The study attempted to determine whether there is a specificity in the mental organization of these children, whether the experiences of survivor-parents are transmitted to subsequent generations, and whether this transmission effects structural changes either as special areas of ego strength or ego split which enrich or burden the psychic organization of the offspring. It was found that only a small number of

survivors' children had been psychoanalyzed, perhaps reflecting the resistance of the psychoanalyst, combined with that of survivors and their children, to probe into the tragic experiences in depth. There was a consensus of opinion that survivor-parents can generate strength of the ego or damage to the children's ego, but that many more analyses need to be reported before any generalizations can be made about specificity in mental organization of survivors' children. (26 ref)—*Journal abstract*.

3790. Marcus, Robert L. **Historical perspectives on the development of psychoanalytic psychotherapy.** *Israel Annals of Psychiatry & Related Disciplines*, 1972(Dec), Vol 10(4), 289-304.—Discusses Freud's delineation of the limitations of formal psychoanalysis, which can provide guidelines for the technique of psychoanalytic psychotherapy. It is argued that formal psychoanalytic techniques of free association, interpretation, and the avoidance of guidance are usually inappropriate for psychotherapy. Psychoanalytic psychotherapy should be considered basically as a conversational technique. Explanation is a more accurate description of the therapist's intervention than interpretation. Counseling and advice that give proper consideration to the patient's strengths and weaknesses are frequently indicated and are far preferable to manipulative techniques which employ ostensibly nondirective interpretations. However, the most crucial therapeutic activity encompasses the many-faceted effort to achieve an optimal working relationship. The relationship is the main instrument for mastering the emotional disabilities that interfere with psychological and behavioral functioning.—*Journal abstract*.

3791. Myerson, Paul G. **The establishment and disruption of the psychoanalytic *modus vivendi*.** *International Journal of Psycho-Analysis*, 1973, Vol 54(2), 133-142.—Discusses the process set up by a patient in psychoanalysis whereby the patient maintains a view of the analyst as a helpful figure but resists becoming more involved in the ways that the analyst considers helpful for the analytic process. The question is raised of how analysts can best present themselves as helpful and be actually helpful when it is necessary to disrupt a *modus vivendi* which has evolved out of the patient's complex reactions. Case material is provided to illustrate fundamentals of these concepts.—*R. S. Albin*.

3792. Nishizono, Masahisa. (Kyushu U, Faculty of Medicine, Fukuoka, Japan) **[Modern psychiatry and patient care: IX. Psychoanalysis.]** (Jpn) *Kyushu Neuro-psychiatry*, 1971(Dec), Vol 17(3-4), 152-160.—To emphasize the importance of psychoanalysis in the field of psychiatry, a brief history and some practical applications of psychoanalytic theory are presented. Psychoanalysis has value not only as a theory but also in its applications to the understanding of man and the symbolic meanings of human behavior, literature, and other arts.

3793. Olinick, Stanley L.; Poland, Warren S.; Grigg, Kenneth A. & Granatir, William L. **The psychoanalytic work ego: Process and interpretation.** *International Journal of Psycho-Analysis*, 1973, Vol 54(2), 143-151.—Describes the work ego as the temporarily built-up "person" who functions under the circumstances and for the period of his work. The primary data of the work ego

are the processes of the analyst as they parallel those of the patient. The work ego operates autonomously and exercises diatrophic functions. Within the therapeutic alliance it regresses with and observes both the patient and itself, thus enabling the paralleling of processes. The work ego responds to its own regression as a signal, and is motivated by empathic regression in the service of the other. A unitary model of the intrapsychic and interpersonal processes involved in certain functions of the work ego is presented. (19 ref)—*R. S. Albin*.

3794. Silber, Austin. (State U New York, Downstate Medical Ctr, Div of Psychoanalytic Education, Brooklyn) **Secondary revision, secondary elaboration and ego synthesis.** *International Journal of Psycho-Analysis*, 1973, Vol 54(2), 161-168.—Discusses the secondary revision of the dream and its relation to the specific functions of the ego that can be isolated and highlighted in the exposition and analysis of a dream. Instances in which secondary revision of a dream occur are cited with particular reference to Freud's work. Case material is provided to illustrate relevant procedures of dream interpretation, and the therapeutic alliance, the working alliance, and the transference relationship are discussed. It is concluded that ego synthesis is an extremely complex process, operative in a host of structures within the system ego. (19 ref)—*R. S. Albin*.

3795. Stierlin, Helm. (NIMH Adult Psychiatry Branch, Bethesda, MD) **Interpersonal aspects of internalizations.** *International Journal of Psycho-Analysis*, 1973, Vol 54(2), 203-213.—Discusses the relationship between interpersonal processes and internalizations, focusing on the dimensions of the exclusivity of dependence, interpersonal intensity, and the status of boundaries. It is necessary to determine whether these mechanisms serve the patient's defensive or growth needs. The concept of different transactional modes—"binding," "expelling," and "delegating"—is introduced to illustrate these interpersonal dimensions and how they can differentially affect evolving internalizations. The problems of adolescent separation particularly demonstrate how internalizations may serve the needs of defense, growth, or both. (53 ref)—*Journal summary*.

#### Counseling & Community Mental Health & Crisis Intervention

3796. Adis Castro, Gonzalo. (Inst of Psychological Investigations, Faculty of Sciences & Letters, San José, Costa Rica) **[Community psychology and psychiatry.]** (Span) *Acta Psiquiátrica y Psicología de América Latina*, 1974(Feb), Vol 20(1), 23-31.—Discusses the new community orientation of psychiatry, which emphasizes both primary and secondary prevention. The 1st implies an effort to reduce the probability that a case of mental illness will occur, while the 2nd tries to reduce the already existing cases of mental illness, emphasizing early detection and treatment as close to the home and community of the individual as possible. The emphasis of community psychology is on primary prevention, while that of community mental health is on secondary prevention.—*English summary*.

3797. Ahmed, M. Basheeruddin & Stein, David D. (Sound View—Throgs Neck Community Mental Health Ctr, Bronx, NY) **Children's mental health services: A**

**case study of a successful grant proposal.** *Hospital & Community Psychiatry*, 1974(Sep), Vol 25(9), 591-595.—Describes the methods used by a mental health center's staff and members of its community advisory boards to develop a grant application for children's psychiatric services. The process involved community assessment of needs, the reconciliation of conflicting priorities among funding agencies, and delineation of the specific services to be developed. The important role played by the community advisory board members is emphasized.—*Journal abstract*.

3798. Barnabei, Fred; Cormier, William H. & Nye, L. Sherilyn. (John Carroll U, Counseling Ctr) **Determining the effects of three counselor verbal responses on client verbal behavior.** *Journal of Counseling Psychology*, 1974, Vol 21(5), 355-359.—Determined the effects of 4 counselor stimulus conditions on 3 measures of client verbal behavior, using 20 female college sophomore clients. The counselor stimulus conditions were reflection of feeling, probe, confrontation, and unspecified responses. The 3 dependent variables were client affect words, self-referent pronouns, and present verb tense. 20 subjects were assigned randomly to 1 of 4 trained Es (2 male and 2 female counselors) for a 42-min session. The 1st 2 min were a preliminary orientation period. The remaining 40 min were divided into 4 10-min counselor stimulus conditions. The sequence of stimulus conditions was randomized for each session. A  $2 \times 2$  factorial analysis with repeated measures on the 2nd factor indicated no significant differences for each dependent variable. The implications for indiscriminate use of these 4 counselor stimulus conditions are discussed with respect to counselor training and research. (24 ref)—*Journal abstract*.

3799. Beigel, Alan et al. (Southern Arizona Mental Health Ctr, Tucson) **Planning for the development of comprehensive community alcoholism services: I. The prevalence survey.** *American Journal of Psychiatry*, 1974(Oct), Vol 131(10), 1112-1116.—Points out the need for adequate prevalence data in the planning of comprehensive community alcoholism programs and that such planning must be based on the needs of the specific community. Data from a survey of 5,160 problem drinkers is presented in terms of socioeconomic status, race, age, and other prevalence variables. A method of obtaining useful prevalence data in a brief period of time and at a modest cost is presented, with examples of how these data can be used in planning a rational program for a specific community.—*Journal abstract*.

3800. Beigel, Allan et al. (Southern Arizona Mental Health Ctr, Tucson) **Planning for the development of comprehensive community alcoholism services: II. Assessing community awareness and attitudes.** *American Journal of Psychiatry*, 1974(Oct), Vol 131(10), 1116-1121.—Considers that in the development of an effective community education and treatment program for alcoholism the following dimensions need to be assessed: (a) attitudes toward alcohol use and abuse, (b) drinking habits, (c) awareness of available services and facilities for the alcoholic, (d) extent of personal drinking problems, and (e) comparative perceptions of alcohol abuse in different ethnic groups. The procedure to make

these assessments is described, and examples of how the data gathered can be used in planning of comprehensive community alcoholism services are presented. Data from a survey of persons in one county in Arizona are presented to show community perceptions of alcoholism and sources of help for drinking problems.—*Journal abstract*.

3801. Bender, M. P. **The role of a community psychologist.** *Bulletin of the British Psychological Society*, 1972(Jul), Vol 25(88), 211-218.—Defines the 4 functions of the community psychologist (CP) as assessment, therapy, research, and policy, and discusses the principles that should determine priorities among these areas and guide operations. It is suggested that the assessment function should not include routine intelligence testing; when assessment by the CP is necessary, it should be understood to involve the client's family. Therapy (except behavior modification) can be performed as well by the psychiatric social worker as by the CP. The conduct of research is an important function, and the CP should also be involved in formal policy planning, especially in instigating change at field level and in developing plans for needed further research and surveys. Some overlapping between the roles of the CP and the psychiatric social worker is unavoidable, but both should have a place in the structure of community health services.—*R. S. Albin*.

3802. Bermudes, Robert W. (Irondequoit United Church of Christ, Rochester, NY) **A ministry to the repeatedly grief-stricken.** *Journal of Pastoral Care*, 1973(Dec), Vol 27(4), 218-228.—Results of a questionnaire administered to 101 wives of submariners associated with civilian churches and Navy Protestant and Roman Catholic chapels showed evidence of stages of the normal grief response observable in individuals who are grieving the death of a loved one. The questionnaire, composed of 94 true-false, multiple choice, and sentence completion questions, measured psychological and physiological responses before, during, and after separation resulting from submariners' life-style. A ministry was designed using small groups, changes in worship, and opportunities for work, to meet the particular needs of the repeatedly grief-stricken family. This grief reaction, while similar in form to that of the loss of a loved one by death, is usually not as intense nor lasts as long.—*B. Smith*.

3803. Cheng, Alexander Hsin-Hsiung. (National Taiwan U, Taipei, Republic of China) **Rapport in initial counseling interview and its impact on effectiveness.** *Acta Psychologica Taiwanica*, 1973, Vol 15, 31-40.—Investigated the variables underlying the establishment of rapport between a counselor and a client and attempted to determine the correlation between rapport and counseling effectiveness. Ss were 6 counselors from a university counseling center and their 16 videotaped cases. Judges rated the cases on Correll's Rapport Rating Scale (RRS) and Hurst et al's Counseling Service Assessment Blanket. Findings suggest that (a) describable variables contributed to the quality of counseling rapport according to the RRS and (b) there was a significant relationship between counseling rapport and the resolution of interpersonal and environmental problems in counseling effectiveness.—*Journal abstract*.

3804. Clark, Stewart C. & Rootman, Irving. (U Calgary, Faculty of Medicine, Alberta, Canada) **Street level drug crisis intervention.** *Drug Forum*, 1974(Spr), Vol 3(3), 239-247.—Describes the Calgary Drug Information Center, a youth-oriented clinic that deals with drug related crises. The Center has approximately 80 nonprofessional volunteers and 7 paid staff members and may prove a useful model upon which to base other youth-oriented drug crisis intervention facilities.

3805. Comstock, Lloyd K. & Slome, Cecil. (U North Carolina, Chapel Hill) **A health survey of students: I. Prevalence of perceived problems.** *Journal of the American College Health Association*, 1973(Dec), Vol 22(2), 150-155.—Describes the physical and mental health problems reported by 1,260 university undergraduates and graduates in response to a self-administered questionnaire. Aims of the survey were to help plan health services needed in a student community and seek possible solutions to health problems. (16 ref)

3806. Comstock, Lloyd K. & Slome, Cecil. (U North Carolina, Chapel Hill) **A health survey of students: II. Satisfaction, attitudes, and knowledge.** *Journal of the American College Health Association*, 1973(Dec), Vol 22(2), 156-159.—Reports the general attitude toward the university's health services among 1,260 students as "neutral satisfaction." Specific aspects of the services, however, suggested possible improvements. Student knowledge of available services was deficient. Student participation in policy making and administration is strongly recommended.—R. S. Albin.

3807. d'Augelli, Anthony R. et al. (Pennsylvania State U, Div of Individual & Family Studies) **Interpersonal skill training for dating couples: An evaluation of an educational mental health service.** *Journal of Counseling Psychology*, 1974, Vol 21(5), 385-389.—In a previous study by S. Schlein (1971) of a preventative mental health program which stressed relationship improvement by maximizing empathy and self-disclosure, the efficacy of the program in improving communication and the general quality of the relationship between 48 college dating couples was demonstrated. The present reanalysis of Schlein's data shows that the experimental group, compared to the control group, also improved significantly on 2 key behavior rating scales by R. R. Carkhuff which are widely used to assess the efficacy of general helping relationship skills. As a result of less than 20 hrs of training, participants moved from providing levels of skills typical of college students to levels provided by typical counselors. The Empathy scale was highly correlated with 2 other Carkhuff scales, Respect and Immediacy. The trained Ss also showed a significantly greater increase in self-disclosure. (28 ref)—*Journal abstract*.

3808. D'Augelli, Anthony R. (Pennsylvania State U, Div of Individual & Family Studies) **Nonverbal behavior of helpers in initial helping interactions.** *Journal of Counseling Psychology*, 1974, Vol 21(5), 360-363.—Although helper nonverbal behavior presumably is important for effective helping, few studies have examined its importance for clients in actual helping interactions. In the present study with 168 undergraduates, several nonverbal behaviors of helpers in a small group were tallied and related to independent judgments of the

helper made by observers and the person being helped. Trained observers' ratings of overall effectiveness were related to frequency of smiling and nodding. Ratings made by other group members also showed significant relationships to the nonverbal behaviors. Helpee-related understanding and warmth correlated with frequency of helper nodding. The low but significant correlations suggest that nonverbal behaviors are but one set of cues that lead to clients' first impressions of their helpers.—*Journal abstract*.

3809. Darley, Philip J. (Fishponds Health Ctr, Britsol, England) **Who shall hold the conch? Some thoughts on community control of mental health programs.** *Community Mental Health Journal*, 1974(Sum), Vol 10(2), 185-191.—The author's experiences at an English day center for recovered psychotics suggests a need for mental patients to be given considerable control over their own program or else succumb to the Queequeg syndrome. This results from patients accepting and adapting to unrealistic roles that a prejudiced society has thrust upon them. It appears that the syndrome applies equally to other disadvantaged groups, notably to the poor. An appropriate form of treatment will be to give consumers a large measure of control over mental health programs.—*Journal abstract*.

3810. Denner, Bruce. (Illinois Mental Health Inst, Chicago) **Returning madness to an accepting community.** *Community Mental Health Journal*, 1974(Sum), Vol 10(2), 163-172.—The varieties of care for the chronically mentally ill reflect to a greater or lesser extent 3 distinct orientations: to seclude and punish, to treat and rehabilitate, and to provide refuge and retreat. Unfortunately contemporary small intensive treatment hospitals and rehabilitation-oriented halfway houses tend to revert back to traditional seclusion and punishment techniques out of a sense of professional responsibility. A more radical alternative, the cooperative commune (e.g., R. D. Laing's Kingsley Hall) avoids seclusion and punishment and provides refuge and treatment, but because of its permissive and elitist attitudes is unlikely to win public support. Given this dilemma, the developing of nonprofessional neighborhood groups that have no vested interest in controlling the mentally ill but that are naturally accepting and therapeutic is recommended. To illustrate this approach, a history of a volunteer community group is related. (19 ref)—*Journal abstract*.

3811. Dressler, David M. & Nash, Kermit B. (New Britain General Hosp, CT) **Project team organization and its application to crisis intervention.** *Community Mental Health Journal*, 1974(Sum), Vol 10(2), 156-162.—Describes a team approach to the treatment of clients in a state of crisis. The team consists of mental health specialists selected on the basis of expertise in performing tasks required by a particular client. The team leader is designated based on skill in establishing effective client rapport. The leader manages the team activities, expanding or contracting the team membership according to the needs of the client. The leader represents the team in its interface with the sponsoring service and is accountable to the service for completion of task assignments. The team model is applicable to various health care systems and provides a mechanism for the training of mental health professionals.—*Journal abstract*.

3812. **Ewalt, Patricia L.** (Greater Framingham Mental Health Assn, Youth Guidance Ctr, MA) **Use of child guidance services: Some indicators of changing patterns.** *Massachusetts Journal of Mental Health*, 1974(Spring), Vol 4(3), 13-26.—Studied family behavior patterns in a child guidance clinic where half of all families terminate before evaluation is completed and treatment undertaken. Continuance was found to be related to the following situations: (a) when the child was younger than 12; (b) when the mother's education went beyond high school; (c) when the parents were worried about the child's behavior rather than about how the authorities viewed it; (d) when stubbornness was a problem; and (e) when parent(s) asked for help in learning to manage the problem, rather than asking the clinic to do something directly to the child. It is suggested that intervention, not in-depth diagnosis, should be stressed from the outset. —A. Krichev.

3813. **Fiester, Alan R.; Mahrer, Alvin R.; Giambra, Leonard M. & Ormiston, D. W.** (U Illinois, Medical Ctr, Neuropsychiatric Inst, Chicago) **Shaping a clinic population: The dropout problem reconsidered.** *Community Mental Health Journal*, 1974(Sum), Vol 10(2), 173-179.—Compared dropout and nondropout community outpatients on a number of demographic variables (e.g., age, sex, religion, diagnosis, and source of referral). Ss were 618 adult and child patients who had been seen at a state-supported mental health outpatient center during 1967-1968. A cross-validation sample consisted of 513 Ss seen during 1968-1969. "Dropout" was operationalized in terms of both session-number cutoff and failure to appear for scheduled appointment(s). With the exception that early dropouts had less previous therapy than later dropout or nondropout patients, no important group differences occurred. Findings suggest that outpatient clinics "shape" patients into 2 groups: those who make repeated use of a variety of mental health services, and those who quickly turn away from these services and are unlikely to reapply at a later date. (23 ref)—*Journal abstract*.

3814. **Frankel, Fred H.** (Beth Israel Hosp, Boston, MA) **The use of hypnosis in crisis intervention.** *International Journal of Clinical & Experimental Hypnosis*, 1974(Jul), Vol 22(3), 188-200.—Presents 3 case summaries (of a 31- and a 36-yr-old woman and a 28-yr-old man) in which the clinical symptoms are reminiscent of features of trance. The dramatic quality of the clinical pictures led to crises which required rapid and effective intervention. The spontaneous development of hysterical psychoses and states of somnambulism in persons with marked hypnotic susceptibility suggests that less flamboyant clinical symptoms might be produced spontaneously by smaller degrees of hypnotic susceptibility. The trance-like clinical manifestations are discussed as maladaptive defenses against anxiety. The role of hypnosis in the treatment plan is considered. (German, French & Spanish summaries)—*Journal abstract*.

3815. **Goldberg, Alan D.** (Syracuse U) **Conceptual system as a predisposition toward therapeutic communication.** *Journal of Counseling Psychology*, 1974, Vol 21(5), 364-368.—Investigated the relationship between conceptual level and counselor trainee behavior in a counseling analog. Comparison of the verbal responses

of 86 graduate student counselors, using the 6 categories of E. Amidon's counselor interaction analysis and Griffin's Counselor Verbal Response Scale, indicated differences in the response patterns of students as a function of their conceptual level. It is concluded that conceptual level may be an important variable for counselor selection and program development. (16 ref)—*Journal abstract*.

3816. **Goodman, Marvin.** (Board of Education for the Borough of North York, Downsview, Ontario, Canada) **Day treatment: Innovation reconsidered.** *Canadian Psychiatric Association Journal*, 1974(Feb), Vol 19(1), 93-97.—Describes the development of a day care program for disturbed children within a child guidance clinic. Problems in making policy, carrying out day-to-day operations, giving in-service training, and evaluating results are reported. (French summary)

3817. **Halpern, Esther.** (Tel-Aviv U, Israel) **Volunteering in times of community crisis: An integration within Caplan's theory of support systems.** *Canadian Psychologist*, 1974(Jul), Vol 15(3), 242-250.—Uses community work done during a period of national crisis, the October 1973 War in Israel, as a basis for discussing some assumptions about the mental implications of volunteering. Within G. Caplan's theory of support systems (1974), volunteering is considered a phenomenon that can be "mimicked," as avenues for mental health intervention are sought for populations hit by a disaster. The issue of how to best utilize the services of volunteers is raised, as the phenomenon appears to proceed through different phases. Following Caplan's distinction between 2 types of informal care-givers, the "generalist," and the "specialist," it is suggested that volunteers be used differently at specific phases of crises, in order to provide mental health benefits for both helpers and those being helped. (French abstract) (15 ref)—*Journal abstract*.

3818. **Heard, D. H.** (Tavistock Inst of Human Relations, Unit for the Study of Psycho-Social Transitions, London, England) **Crisis intervention guided by attachment concepts: A case study.** *Journal of Child Psychology & Psychiatry & Allied Disciplines*, 1974(Apr), Vol 15(2), 111-122.—Uses a case study of a suicide attempt by a young adolescent boy to illustrate how attachment concepts, expressed through the metaphor of personal assumptive worlds, may be used to guide intervention in crisis situations in child and adolescent psychiatry. (31 ref)

3819. **Heilbrun, Alfred B.** (Emory U) **Interviewer style, client satisfaction, and premature termination following the initial counseling contact.** *Journal of Counseling Psychology*, 1974, Vol 21(5), 346-350.—57 female and 38 male clients at a university counseling center were interviewed by 1 of 4 interviewers (3 male and 1 female) to test 2 alternative explanations for early defection of female counseling clients. One explanation proposes that the dependent, self-disclosing female is frustrated by nondirective, initial interviews which fail to provide the structure she needs to formulate her problems. Dissatisfaction leads her to leave counseling. The 2nd alternative is that nondirective, initial interviews are satisfying because they provide the dependent, self-disclosing female with the opportunity for cathartic relief. She subsequently terminates because she feels

better. Likelihood to defect was measured by Adjective Check List scores prior to the interview, and evaluations of interviewer directiveness and interview satisfaction were obtained from clients immediately following the initial interview. Greater satisfaction with nondirective interviewing by females more likely to defect was found, which favored the catharsis alternative.—*Journal abstract*.

3820. Heinemann, Shirley H.; Perlmutter, Felice & Yudin, Lee W. (West Philadelphia Community Mental Health Consortium, PA) **The community mental health center and community awareness.** *Community Mental Health Journal*, 1974(Sum), Vol 10(2), 221-227.—Surveyed 108 residents living within half a mile of local satellites of a community mental health center. Findings reveal that only 15% were aware of the existence of the parent agency, with no differences among local centers. Residents' awareness of the satellite centers and their services ranged from 18 to 62% with an overall mean of 32%. Questions are raised concerning relevant differences contributing to the residents' differential awareness of the centers, and suggestions are offered for raising the level of awareness via outreach techniques, especially with respect to emergency interventions.—*Journal abstract*.

3821. Herman, Melvin & Freeman, Lucy. **The pursuit of mental health: For the individual, the community, and the nation.** New York, NY: Macmillan, 1974. 142 p. \$6.95.—Investigates the services available for the treatment of psychiatric disturbances. Mental illness in general, out-patient therapies, and treatments available in both public and private mental hospitals are discussed. Among the topics treated are the varying needs for hospitalization or out-patient therapy, the length of hospital stay, and hospital programs for the alcoholic and drug addict.

3822. Holland, Winford E. & Huntoon, Harrison H. (U Houston) **The evaluation of experimental social service delivery systems at the community level: An organizational effectiveness view.** *Community Mental Health Journal*, 1974(Spr), Vol 10(1), 41-51.—Discusses issues relevant to the evaluation of experimental or pilot programs at the community level. A concept of organizational effectiveness is detailed in terms of an environmental impact model, and the role of the evaluation function is presented in terms of information production. The evaluation coalition is portrayed as a major factor in the political environment for evaluation. 3 alternative organizational configurations are described and evaluated. Generalized steps for the design and implementation of the evaluation subsystem are presented.—*Journal abstract*.

3823. Hornstra, Robijn K. & Udell, Bess. (U Missouri, Medical School, Kansas City) **A measure of delivery patterns in psychiatric care.** *Community Mental Health Journal*, 1974(Spr), Vol 10(1), 84-88.—Illustrates the practicality of using the ratio of a 1-yr applicant count over a 1-day caseload count to evaluate service delivery patterns. The measure is used to compare the ratios of various facilities and of major diagnostic groups, and as an index of change of delivery patterns.

3824. Jolliff, James W. **Community service by eclectic private psychiatry.** *American Journal of*

*Psychiatry*, 1974(Sep), Vol 131(9), 976-980.—Presents a subjective and statistical study of the nature and contribution of the author's private psychiatric practice before and after the establishment of a community mental health and mental retardation center in his community. He defends the practical values of patient triage, limited therapeutic goals, and eclecticism in private practice.

3825. Kidori, Irwin W. & Thomas, Lisa A. (Cumberland County Guidance Ctr, Millville, NJ) **Happiness is being known.** *Journal of the Medical Society of New Jersey*, 1974(Aug), Vol 71(8), 591-594.—Mailed questionnaires to 580 randomly selected county residents in an attempt to determine how well the services of the county community mental health center were known by residents; 102 questionnaires were returned. It was found that 83% of the respondents claimed some knowledge of the center. Income level and location of residence within the sample did not significantly affect level of awareness, although demographic data were important. The clergy were named most frequently as a source of emotional help, and newspaper advertising appeared to have been effective in increasing knowledge of one service. Results are compared with other studies, and differences are discussed.—*Journal abstract*.

3826. MacDonald, K. R.; Hedberg, A. G. & Campbell, L. M. (Sioux Falls Mental Health Ctr, New Ulm, MN) **A behavioral revolution in community mental health.** *Community Mental Health Journal*, 1974(Sum), Vol 10(2), 228-235.—Considers that there are many professionals who are predicting the eventual demise of community mental health because of a failure to develop a relevant conceptual model for community intervention. It is argued that behavior theory offers the potential for conceptualizing the individual's interaction with his environment. Further, the behaviorally oriented mental health worker has several choices of intervention available to him, including the roles of consultant-therapist, consultant-educator, or consultant-systems engineer. These models or choices are described and recommendations for the enhancement of community mental health service delivery are presented.—*Journal abstract*.

3827. McKelvie, William H. (Bowie State Coll) **An evaluation of a model to train high school students as leaders of Adlerian guidance groups.** *Individual Psychologist*, 1974(May), Vol 11(1), 7-14.—Formed 3 groups of 11th graders—counselor helper (CH), active control (AC), and inactive control (IC)—to determine if they could (a) be trained to lead Adlerian-oriented guidance groups for junior high students in which the 11th graders would be able to accurately assess behavioral patterns of their group members and (b) make the group discussions enjoyable for group members. A comparison group of students in an elementary counseling practicum was also used. At the end of 10 training sessions, CH and AC Ss conducted 3 group discussions each with groups of 5 junior high students. Results suggest that high school students are capable of learning and utilizing the Adlerian model of leading small group discussions. It is also suggested that the skills utilized in counseling situations may be both learned and utilized without requiring students to complete lengthy training periods.

A comparison of CH- and AC-led groups indicates that while initial sessions of both groups began enthusiastically, AC leaders immediately began to flounder and the attendance of their groups dropped during the next 2 sessions. In similar situations, CH leaders employed various techniques to keep the interest of their group members. (33 ref)—*M. E. Pounsel.*

3828. McWilliams, Spencer A. & Morris, Larry A. (U Arizona) **Community attitudes about mental health services.** *Community Mental Health Journal*, 1974(Sum), Vol 10(2), 236-242.—Assessed community attitudes toward a new mental health center by calling 110 randomly selected residences. Drugs and alcohol were seen as the community's most pressing social problem. Respondents were favorable to mental health centers and public funding and had accurate information about many aspects of mental health problems, although misinformation about types of services, professional staffing, and length of treatment was present. The favorable community attitude is seen as providing a base for increased public education in areas of misinformation and more consultation and preventive programs in areas of community concern.—*Journal abstract.*

3829. Mendonca, Marcus & Mariz, Paulo. (Hospital Psiquiátrico de Tamarineira, Recife, Brazil) [The current trend and status of the state mental care in Pernambuco, Brazil.] (Port) *Neurobiologia*, 1974(Jan), Vol 37(1), 51-70.—Considers the quality of the assistance offered mental patients and the type of preventive measures employed and suggests a philosophical and political scheme of mental health care based on functional and financial goals for the years 1972-1975. (20 ref)

3830. Meyers, William R.; Dorwart, Robert A.; Hutcheson, Bellenden R. & Decker, Douglas. (U Cincinnati) **Organizational and attitudinal correlates of citizen board accomplishment in mental health and retardation.** *Community Mental Health Journal*, 1974(Sum), Vol 10(2), 192-197.—A previous report by W. R. Meyers et al (see PA, Vol 49:9694) described the methodology used in identifying 4 types or strategies of accomplishment among the 37 Massachusetts Mental Health and Retardation Area boards: service creation, mobilization of outside resources, local autonomy, and coordination. Further research reported here indicates that organizational and administrative characteristics of the boards (e.g., affiliation with private mental health associations or the presence of a permanent office for the board's use) were related to the type of accomplishment strategy pursued by a board. In addition, the attitudes, beliefs, and length of membership of citizen board members, as gathered from a mail questionnaire, were also related to the strategy of board accomplishment.—*Journal abstract.*

3831. Minde, Klaus K.; Benierakis, Costas E.; Sykes, Elizabeth & Anderson, R. A. (McGill U, Montreal, Quebec, Canada) **The response of school children in an upper-middle-class area to intensive psychiatric counseling of their teachers: A controlled evaluation.** *Journal of Special Education*, 1972(Fal), Vol 6(3), 267-277.—Rated the classroom behavior of 20 normal and 40 disturbed 3rd-6th graders in an upper-middle-class school, using a frequency-counting technique. Following an initial observation period, 20 of the disturbed Ss were given an intensive period of treatment. All Ss were reevaluated at

the end of treatment and 3 and 12 mo later. The method of measurements discriminated well between the normal and treated disturbed Ss in all but 1 category of behavior. The untreated disturbed Ss varied in their psychopathology from the treated group, showing more neurotic symptoms, while the symptoms of the treated Ss included more disruptive behavior. During treatment, the selected group improved significantly on 3 out of 9 behaviors, which, however, accounted for more than 77% of all observed behavior time, but did not maintain their improvement following termination of teacher counseling. Findings are discussed in terms of the children's psychopathology, duration of treatment, and involvement of the total family. (19 ref)—*Journal abstract.*

3832. Nelson, Bardin H. & Pecarchik, J. Robert. (Mon Valley Community Health Ctr, Experimental Health Services Delivery System Project, Monessen, PA) **A computerized program audit for community mental health clinics.** *Community Mental Health Journal*, 1974(Spr), Vol 10(1), 102-110.—Describes a computer prototype system developed on a demonstration basis for a mental health-mental retardation clinic. The objectives of the system were to (a) simplify the data collection, storage, and reporting tasks in order to free staff for service delivery duties; and (b) provide the clinic with the means for conducting accurate and meaningful evaluations of its operation and service delivery. The economic advantages of such a system for smaller community mental health clinics are noted.—*Journal abstract.*

3833. Nuehring, Elaine M.; Fein, Sara B. & Tyler, Mary. (Florida State U) **The gay college student: Perspectives for mental health professionals.** *Counseling Psychologist*, 1974, Vol 4(4), 64-72. Proposes that the "illness" model is not appropriate for dealing with gay clients. Their primary problem is like that of any other minority—discrimination. Homosexuality is discussed from the viewpoint of the gay liberation movement. Definitions of homosexual words and phrases are given. Data regarding homosexual identity, the gay couple, the gay friendship group, and the gay contraculture are analyzed. It is concluded that the homosexual's relations with a hostile cultural environment should be emphasized rather than his personal pathology. (31 ref)—*H. Silverman.*

3834. Otto, Jean & Moos, Rudolf. (Stanford U) **Patient expectations and attendance in community treatment programs.** *Community Mental Health Journal*, 1974(Spr), Vol 10(1), 9-15.—Used the Community Oriented Programs Environment Scale to assess the effect of the expectations of newly admitted members to 4 community-based psychiatric programs. 27 "good" patients (those who attended regularly and participated well in the program) and 26 "poor" patients (those who had been absent frequently and made little use of the program) were used to ascertain whether prospective members would make better use of the program if their expectations of the social climate matched those of actual program participants. Results indicate that there was a tendency for all new program members to have somewhat unrealistic expectations. Both groups had similar expectations of how free they would be to express angry feelings and how orderly the program would be, expected staff control to be fairly high, and expected

more emphasis in most areas than is found in the average community treatment program. Results suggest that patients who show unrealistically positive expectations have a greater likelihood of absenteeism, dropout, and poor participation in such a program.—*M. Pounsel.*

3835. Pimm, June B. (Pimm Consultants, Ottawa, Ontario, Canada) **Community-oriented private practice.** *Ontario Psychologist*, 1974(Aug), Vol 6(3), 9-15.—Discusses the provision of school psychological services by a private consulting firm. The arrangement has resulted in lower costs to the community without sacrifice of professional standards.

3836. Safer, Daniel. (Baltimore County Dept of Health, School Mental Health Service, MD) **Factors affecting outcome in a school mental health service.** *Community Mental Health Journal*, 1974(Spr), Vol 10(1), 24-32.—Tested the efficacy of the type of treatment offered by a school mental health service and attempted to determine the factors that appear to have affected the outcome of that treatment. The study was based on teacher-judged classroom behavior change in 70 children in a suburban area department of health who were selected because (a) school-related aspects of their personal and social difficulties were deemed moderate to severe, (b) the school personnel team reported that their efforts had been unsuccessful, and (c) the family was not utilizing private mental health professionals. Findings indicate that 40% of the children showed a hyperactive-learning impaired pattern. The use of stimulant medication for the majority of the group resulted in classroom improvement. Time-limited therapy for academically retarded, chronically misbehaving children produced limited classroom benefits. Parental antagonism toward school authorities was frequently related to student suspensions. The child's IQ was a significant positive outcome factor, and persistence in treatment was greater when medication was prescribed. (24 ref)—*Journal abstract.*

3837. Sharfstein, Steven S. (Alcoholism, Drug Abuse & Mental Health Administration, Office of Program Planning & Evaluation, Rockville, MD) **Neighborhood psychiatry: New community approach.** *Community Mental Health Journal*, 1974(Spr), Vol 10(1), 77-83.—Describes the function of a neighborhood psychiatric team, using a "family life center" as a base of operations for a comprehensive preventive and treatment program in one neighborhood of Boston. This program consists of direct treatment services to neighborhood residents, consultation with health and social service professionals and paraprofessionals in the family life center itself, and consultation with other community agencies. The advantages of working in a neighborhood—early intervention in crisis with individuals and agencies, accessibility to the entire family, integration with general health services, and easy follow-up and aftercare of recently discharged psychiatric patients—are described with case examples.—*Journal abstract.*

3838. Tapp, Jack T.; Ryken, Virginia & Kaltwasser, Carl. **Counseling the abusing parent by telephone.** *Crisis Intervention*, 1974, Vol 5(3), 27-37.—Discusses procedures and issues involved in operating a 24-hr crisis service dealing with child abuse. The focus is on ways in which phone workers can help potentially abusing

parents; special problems to be anticipated with this population are identified.

3839. Thompson, David & Thompson, Jennifer. (U Lancaster, England) **Nightline: A study self-help organization.** *British Journal of Guidance & Counseling*, 1974(Jul), Vol 2(2), 200-211.—Presents an account, for those interested in setting up student self-help organizations, of the origins and growth of the Nightline group at a British university. Modeled on principles of the Samaritans (a suicide prevention crisis center), Nightline functions as an adjunct to the official welfare services provided by the university. Details are given of the selection and preparation of its student volunteers, the organization of the group, and the nature and incidence of its usage during its 1st complete academic year.—*Journal abstract.*

3840. Thoreson, Richard W. (U Missouri) **The evolution of counselling.** *British Journal of Guidance & Counseling*, 1974(Jul), Vol 2(2), 171-181.—Presents the history of counseling in the US in terms of 4 developmental stages: infancy, early childhood, late childhood, and adolescence. It is suggested that client-centered counseling may be an inadequate model as counseling moves into adulthood. The emphasis on relationship is necessary but not sufficient. A more active approach is needed in which the counselor is prepared to (a) use a wider variety of techniques, (b) take actions about clients' problems rather than just talk about them, and (c) devote more attention to a training and support role in relation to a wide variety of community agencies. (33 ref)—*Journal abstract.*

3841. Walsh, Joseph A. & Phelan, Thomas W. (Du Page County Mental Health Ctr, Wheaton, IL) **People in crisis: An experimental group.** *Community Mental Health Journal*, 1974(Spr), Vol 10(1), 3-8.—Discusses the planning, operation, and termination of a community mental health center's 17-member crisis group. Observations of Ss over a 6-mo period indicate the following: (a) It would be helpful to involve other significant people in the patient's life in the pregroup interview or in the group itself. (b) Cases involving chronic depression do not appear to be good candidates for a short-term group treatment approach, even though the depression might flare up periodically into situations that are more or less acute crises. (c) A male and female cotherapy combination might be more effective than 2 male therapists, thus encouraging the patient to perceive the therapists in the former combination as symbolic parents and helping him to see the group as supportive. (d) It would be helpful to get people involved either with the group therapists or with the group itself earlier in the course of their involvement with the clinic.—*Journal abstract.*

3842. Waxer, Peter. (York U, Toronto, Ontario, Canada) **Community psychology in colleges: II. Psychologist as administrator.** *Canadian Psychologist*, 1974(Jul), Vol 15(3), 251-257.—Discusses community psychology programming where the psychologist is an integral part of the target community. Examples of primary and secondary prevention are discussed, along with an example of how organizational psychological principles can be utilized within a university community. It is suggested that a community psychological approach to universities not only facilitates administrative policy-making, but is

also valuable in introducing university students to a paradigm of thinking about their living and working environment that they can carry out to the community at large. (French abstract)—*Journal abstract*.

3843. Weissman, Sidney; Diers, Arthur & Bemederfer, Sandra. (Michael Reese Youth Clinic, Chicago, IL) **Psychiatric services in a youth corrections unit.** *Hospital & Community Psychiatry*, 1974(Sep), Vol 25(9), 602-605.—Presents 4 cases as illustrations of a midwestern psychiatric clinic's method of treating delinquents. The program involves the delinquent, his parents, and other public organizations.

3844. Wideman, Harley. **The effects of discriminatory practices in funding upon the development of professional practice in psychology.** *Ontario Psychologist*, 1974(Aug), Vol 6(3), 31-35.—Asserts that the development and availability of psychological services in Ontario are impeded by their exclusion from publicly funded health insurance schemes. There is no evidence to suggest that including such services increases costs; in fact, the evidence indicates that early treatment of mental health disorders reduces overall costs of medical expenses. The private practitioner is considered likely to give better and cheaper service than the institutional program. It is concluded that insurance coverage would lead to greater and more innovative utilization of psychologists and would benefit the entire profession.—A. Krichev.

3845. Wilson, Charles J.; Muzekari, Louis H.; Schneps, Suzanne A. & Wilson, Dorothy M. (Albert Einstein Community Mental Health Ctr, Philadelphia, PA) **Time-limited group counseling for chronic home hemodialysis patients.** *Journal of Counseling Psychology*, 1974, Vol 21(5), 376-379.—Compared the effects of 6 sessions of group counseling of 9 chronic home hemodialysis patients with a comparable no-treatment control group of 9 patients. Scores on Rotter's Internal-External Control Scale and selected California Personality Inventory scales revealed no significant differences between groups. However, observed changes were noted within the experimental group from pre- to posttesting on 2 of the measures. Subsequent testing 1 yr later of 11 of the Ss suggested that hemodialysis patients use the defensive mechanism of denial in adapting to their condition.—*Journal abstract*.

3846. Winer, Jerome A.; Dinello, Frank A.; Pasca, Alyce & Weingarten, Samuel. (U Chicago) **University mental health services in Illinois.** *Journal of the American College Health Association*, 1973(Dec), Vol 22(2), 138-142.—Presents a survey of the health services available to students attending Illinois universities. More universities in this state were found to have mental health programs organized to serve students than those surveyed elsewhere. Negative factors include poor staffing, services restricted to students only, inadequate referral services, absence of outpatient mental health services, and male directorship of 95% of the school health programs studied. These are the results of a questionnaire sent to 56 clinic directors.—R. S. Alvin.

#### Physical Treatment

3847. Carney, M. W. & Sheffield, B. F. (Northwick Park Hosp, Harrow, England) **The effects of pulse ECT**

**in neurotic and endogenous depression.** *British Journal of Psychiatry*, 1974(Jul), Vol 125, 91-94.—Administered the Hamilton Depression Rating Scale, the Purpose-in-Life Test (PILT), Kellner and Sheffield's self-rating scales of psychological distress, and a 4-point global rating scale to 53 endogenous and 22 neurotic depressives before and after they received pulse electroconvulsive therapy (ECT). After ECT, significantly more endogenous (72%) than neurotic (32%) depressives were rated as socially improved, and endogenous depressives showed a significantly greater decrease in Hamilton scores. Unlike the neurotic depressives, endogenous depressives also showed significant decreases in self-ratings of the number of symptoms and increases in PILT scores.—*Journal summary*.

3848. Foulon, L. **[Bilateral or unilateral electroshock? A review of the literature.]** (Fren) *Acta Psychiatrica Belgica*, 1973(May), Vol 73(3), 356-378.—Reviews the literature on unilateral and bilateral administration of electroconvulsive therapy (ECT). The majority of studies indicate that unilateral ECT applied to the nondominant hemisphere of the brain reduces confusion and memory loss. It permits daily administration and appears no less effective therapeutically than bilateral ECT. (French, Dutch, English, German, Italian, & Spanish summaries) (3 p ref)—E. Coché

3849. Hay, G. G.; Jolley, D. J. & Jones, R. G. (Withington Hosp, Manchester, England) **A case of the Capgras syndrome in association with pseudo-hypoparathyroidism.** *Acta Psychiatrica Scandinavica*, 1974, Vol 50(1), 73-77.—Describes 2 brief episodes of psychosis in a 57-yr-old female patient with pseudo-hypoparathyroid syndrome. The psychotic phenomena occurred in clear consciousness, were schizophrenia-like, and included the Capgras symptom. Both episodes occurred after a course of electroconvulsive treatment given for depressive symptoms, and EEG recordings showed evidence of reduced stability. The content of these psychotic episodes, especially the Capgras symptom, was understandable in view of the patient's restricted social situation. It is suggested that the effect of electroconvulsive treatment acting on a previously abnormal central nervous system was sufficient to produce these schizophrenia-like psychosyndromes.—*Journal abstract*.

3850. Heller, Joyce C.; Gens, George W.; Moe, Diana G. & Lewin, Michael L. (Kean Coll New Jersey, Union) **Velopharyngeal insufficiency in patients with neurologic, emotional, and mental disorders.** *Journal of Speech & Hearing Disorders*, 1974(Aug), Vol 39(3), 350-359.—Investigated the management of 70 4-27 yr old patients with velopharyngeal insufficiency coexistent with neurologic, emotional, or mental disorders, and evaluated changes in the voice quality of those patients who had had pharyngeal flap surgery. Half achieved normal or near normal voice quality; 36%, although not reaching normal voice quality, did show improvement. Thus 86% showed either improved or normal voice. Results fall within the upper range of improvement reported by previous investigators of nonhandicapped patients. Judging from the results of this study, previously reported decisions not to perform surgery on patients with coexisting handicaps may have been too conservative.—*Journal abstract*.

3851. Hoenig, J. (Memorial U Newfoundland, St John's, Canada) **The management of transsexualism.** *Canadian Psychiatric Association Journal*, 1974(Feb), Vol 19(1), 1-6.—Considers that sex-change operations cause not only legal complications but also psychological problems. Legal aspects of the operation are reviewed. The indications for such operations are unclear. It is suggested that more clinical studies and statistical analyses are needed to offset premature theorizing and to circumscribe more precisely transsexualism. (36 ref)

3852. Hunter, Harold G. et al. (Human Resources Research Organization, Alexandria, VA) **Development and evaluation of self-applied plaque indices for children.** *HumRRO Professional Paper*, 1974(Jun), No 10-74, 12 p.—Tested 4 experimental systems for encouraging children to remove dental plaque. Ss were 128 11-12 yr old children. The Count Method, in which the child counts the number of stained teeth and the use of additional materials (photographs) is not required, was superior in reliability and teachability.

3853. Kohli, K. L. & Sobrero, A. J. (Margaret Sanger Research Bureau, New York, NY) **Vasectomy: A study of psychosexual and general reactions.** *Social Biology*, 1973(Sep), Vol 20(3), 298-302.—Analyzed responses to questionnaires obtained from 189 vasectomized males. Except for 2 men who reported discomfort or pain during intercourse, all Ss reported more or the same desire for and enjoyment of sex. Marital harmony also seemed improved. These results are similar to those of other studies. The large majority of vasectomized males expressed general satisfaction with the operation and were willing to recommend it to others.—R. S. Albin.

3854. Kornfeld, Donald S.; Heller, Stanley S.; Frank, Kenneth A. & Moskowitz, Reed. (Columbia U, Coll of Physicians & Surgeons) **Personality and psychological factors in postcardiotomy delirium.** *Archives of General Psychiatry*, 1974(Aug), Vol 31(2), 249-253.—Observed 142 patients through their open-heart surgery experiences. Preoperative psychiatric ratings and psychological tests of personality (including the 16 Personality Factor Questionnaire, WAIS, and the Benton Visual Retention Test) were obtained as well as physical and operative data. 25% of the patients developed a postcardiotomy delirium following a lucid interval and 6% an immediate organic brain syndrome apparent immediately on awakening from anesthesia. It is suggested that postcardiotomy delirium be viewed as a psychosomatic syndrome. There was evidence that beyond the influence of physical and operative variables, a high degree of psychological activity and dominance may contribute to delirium. Further, a group seen by the research team had half the delirium incidence of a comparable group not seen, suggesting that such intervention has a prophylactic-therapeutic function. Prior investigations showing a relationship between delirium and physical and operative variables were confirmed. (28 ref)—*Journal abstract*.

3855. Mark, Vernon H. (Harvard U, Medical School, Boston) **A psychosurgeon's case for psychosurgery.** *Psychology Today*, 1974(Jul), Vol 8(2), 28-33, 84-94.—Explains the use of psychosurgery, particularly for the control of violent behavior. However, it should be confined to the small minority of patients whose mental illness is characterized by aggression and has not

responded to other treatments. The antipsychiatry movement, which includes the attack on psychosurgery, is discussed and criticized in detail.

3856. Martel, Pierre C. (U Sherbrooke, Quebec, Canada) [Study of a case of male transsexualism.] (Fren) *Canadian Psychiatric Association Journal*, 1974(Feb), Vol 19(1), 13-16.—Reports the case of a male patient exhibiting the sexual behavior pattern described by category 6 of H. Benjamin's Sex Orientation Scale (i.e., S had always thought of himself as a female). Neither observation of the patient nor other data reported indicated any sign of castration anxiety, and the patient's identification appeared in all aspects to be a real and complete identification with a female. A 1-yr follow-up after the patient's sex-change operation revealed a generally more relaxed and well-adjusted person; signs of depression, suicidal gestures, and hysterical features had all disappeared. (23 ref)—*English summary*.

3857. Quinlan, Donald M.; Kimball, Chase P. & Osborne, Florence. (Yale U) **The experience of open heart surgery: IV. Assessment of disorientation and dysphoria following cardiac surgery.** *Archives of General Psychiatry*, 1974(Aug), Vol 31(2), 241-244.—Studied 76 20-69 yr old patients undergoing major cardiac surgery. An 11-item behavior checklist was obtained for the 58 patients observed postoperatively. Factor analysis of the checklist yielded 2 factors: (a) Orientation including Alertness, Orientation, Appropriateness, and an Absence of Confusion and Agitation, and (b) Dysphoria including Anxiety, Depression, Agitation, Complaints, and Delusions. The Orientation factor significantly correlated with (a) preoperative absence of organic brain syndrome; (b) lower mortality; (c) earlier discharge; and (d) absence of complications. Age, sex, length of disability, and estimated risk did not correlate. The Dysphoria factor was correlated significantly with complications but not with preoperative depression or emotional stability. (16 ref)—*Journal abstract*.

3858. Squire, Larry R. (VA Hosp, La Jolla, CA) **Amnesia for remote events following electroconvulsive therapy.** *Behavioral Biology*, 1974(Sep), Vol 12(1), 119-125.—20 psychiatric inpatients undergoing a series of electroconvulsive therapy (ECT) treatments for depressive illness were given a test of remote memory for public events, covering the years 1940-1969. Patients tested 40-80 min after their 1st treatment did nearly as well on this test as did a matched control group of medical inpatients. Patients tested 40-80 min after their 5th treatment were markedly impaired across nearly the entire time period sampled by the test. Patients were not impaired on the verbal portion of the WAIS. Results suggest that the amnesic effects of ECT can extend to remote memory as well as to recent memory. (21 ref)—*Journal abstract*.

3859. Wolfers, H.; Subbiah, N. & bin Mazurka, Ariffin. (Columbia U, International Inst for the Study of Human Reproduction) **Psychological aspects of vasectomy in Malaysia.** *Social Biology*, 1973(Sep), Vol 20(3), 315-322.—Presents detailed results of a survey of the medical and psychological effects of vasectomy as reported by 246 Malaysians 1-4 yrs after the operation. Medical findings of the investigation will be reported

separately. In response to a verbal questionnaire, approximately 12% of the Ss reported psychological problems arising from the operation, and these Ss were re-interviewed in depth. 4 variables were studied: regret at having had the operation, fears resulting from it, loss of libido, and marital problems attributed to it. The 1st 3 variables were examined in relation to demographic, social, and other variables. Reported loss of libido is compared with findings of similar studies in India and Europe. The strongest predictor of anxiety concerning vasectomy was disagreement with the S's wife about the advisability of the operation. Specific conclusions are (a) that more detailed preoperative counseling is required for Malaysian vasectomy candidates who have fewer than 4 or 5 children or have children of only one sex, and (b) that more explicit explanation of the fate of the sperm should be elaborated for all candidates in lectures and pamphlets. (16 ref)—R. S. Albin.

### Social Casework & Rehabilitation

3860. Balint, Enid. Technical problems found in the analysis of women by a woman analyst: A contribution to the question "What does a woman want?" *International Journal of Psycho-Analysis*, 1973, Vol 54(2), 195-201.—Describes a major problem in the treatment of a woman patient by a female analyst, which involves the attachment of the patient to her mother. This problem, if not detected, can hold up the treatment and become repetitive. The patient's feeling that the analyst looks to the patient for satisfaction and is excited by her has to be understood not only in terms of a wish to satisfy the mother and the analyst but also as the method the patient adopts to keep her own femininity. Such patients appear to center their lives around their mothers and to choose their husbands in order to repeat this pattern.—*Journal summary*.

3861. Brolin, Donn & Kokaska, Charles. (U Missouri, Rehabilitation Service Education Program, Columbia) Critical issues in job placement of the educable mentally retarded. *Rehabilitation Literature*, 1974(Jun), Vol 35(6), 174-177.—Identifies 7 issues concerning the training and placement of mentally retarded individuals which, if adequately resolved by professional workers, would materially improve the chances that these retarded individuals would take their rightful place in society. The issues are satisfactory vocational adjustment, sufficient employment opportunities, adequate skill evaluation, training considerations, responsibility for employment, the use of labels, and a feasible placement approach. (17 ref)—S. L. Warren.

3862. Brown, Barry S. & Schuman, Alan M. (Narcotics Treatment Administration, Office of Research & Development, Washington, DC) A correctional program for the not too distant future. *Community Mental Health Journal*, 1974(Spr), Vol 10(1), 33-40.—Proposes a program of correctional advocacy constructed on the foundation of an existing system of parole supervision. Key persons in such a program would be community consultants and aides whose primary responsibilities would be to maintain and strengthen, or to establish, prosocial reference groups in the community capable of mitigating the effect of the asocial and antisocial reference groups at work in the institution. These efforts

would be initiated as soon as an individual is admitted into a correctional setting and would continue for a time beyond release, thereby providing a continuity of correctional services rarely encountered in current practice.—*Journal abstract*.

3863. Chambers, Mary. (North Middlesex, Hosp, England) Aspects of social work on a cancer research and treatment unit in a London teaching hospital. *British Journal of Social Work*, 1974(Sum), Vol 4(2), 143-161.—Notes that, with the rapid growth of technology and science, an increasingly large number of people are becoming patients in specialized research and treatment units. The present study describes work in a cancer unit and illustrates ways in which the work is specialized. 4 types of patients treated with cytotoxic drugs are discussed, the unit social worker's role as a team member is outlined, and means of communicating with patients and relatives and of dealing with the patient's defensive processes and affective responses are treated. (29 ref)—*Journal abstract*.

3864. Dibney, Andrew S. (Boston U) Semi-integrated camping for the physically handicapped child. *Rehabilitation Psychology*, 1973(Sum), Vol 20(2), 84-93.—Compared 45 8-16 yr old handicapped boys with a normal control group using critical incidents, brief interviews, tests, questionnaires, and observation forms. The handicapped Ss showed greater gains in self-concept than normals. Counselors who dealt mainly with normal children in the camp showed improved attitudes toward disability based on pre- and posttest evaluations, while the counselors in the unit for handicapped showed less positive attitudes at the end of the camping period. Suggestions for training counselors are presented.—*Journal abstract*.

3865. Ducros, Huguette. (U Grenoble, France) [Psychology in action: Does the psychologist have a place in a functional re-education center?] (Fren) *Psychologie Française*, 1972(Jun), Vol 1(1-2), 71-79.—Describes, on the basis of personal experience as a patient, the role that a psychologist could perform in a center for the functional re-education of paraplegics. The importance assigned to psychological factors in the patients' improvement is contrasted with the absence of psychologists in the hospital environment. 2 main functions for a psychologist in such a center are visualized. The first would be to prevent mutually supporting groups from being broken up for purely administrative reasons. The second would be to educate physiotherapists and help them deal with their patients. The relationships between a physiotherapist and his patient are similar in many respects to those between a psychoanalyst and his client. Physiotherapists are not trained to understand their role nor their patients' "strange" reactions, defenses, and transferences and their own countertransferences.—A. Blasi.

3866. Fischer, Joel & Miller, Henry. (U Hawaii, School of Social Work) The effect of client race and social class on clinical judgments. *Clinical Social Work Journal*, 1973(Sum), Vol 1(2), 100-109.—360 professional social workers employed by the State of California received mailed questionnaires with written case histories which randomly varied in terms of client race, social class, and extent of pathology. Subjects were asked to

complete a Treatment Decision Inventory (TDI) containing 24 items intended to represent diagnostic, treatment, and attitudinal judgments. 5 factors emerged from factor analysis of the 360 returned TDIs: Factor A, "Assessment"; Factor B, "Suitability for Treatment"; Factor C, "Social Emphasis in Treatment"; Factor D, "Tenor of Relationship"; and Factor E, "Attitude." Analysis of variance, carried out on each of the 5 factors, indicate clearly that race, social class, and degree of pathology affected clinical judgments. Black clients were judged more positively than white clients. Lower-class clients were viewed more negatively than upper-class clients, and the more "pathological" case was judged less favorably. Treatment implications are considered in some depth.—S. R. Stein.

3867. Goldberg, Richard T.; Satow, Kay L. & Bigwood, A. Winton. (Massachusetts Rehabilitation Commission, Boston) Vocational adjustment, work interests, work values, and rehabilitation outlook of women on long term hemodialysis. *Rehabilitation Psychology*, 1973(Sum), Vol 20(2), 94-101.—Assessed 22 women on 2 similar semi-structured interviews to obtain pre- and post-dialysis histories yielding comparisons on 12 measures of adjustment. (15 ref)

3868. Goldin, George J.; Margolin, Reuben J.; Stotsky, Bernard A. & Marci, Joseph N. (Northeastern U) Psychodynamics and enablement in the rehabilitation of the poverty-bound client: An approach to reducing dependency. Lexington, MA: D. C. Heath, 1970. xiv, 134 p.—Describes the design, operation, and outcome of a government-sponsored employment and vocational rehabilitation program for the socioculturally disadvantaged poor in New Haven, Connecticut. Demographic and community characteristics, administrative and staff training functions, research and evaluation methodologies, philosophical and psychological issues in the rehabilitation of the poor, data on sample job placements, and implications for broader rehabilitation programs are examined.

3869. Hartlage, Lawrence C. & Johnsen, Russell P. (Medical Coll Georgia, Augusta) Video playback as a rehabilitation tool with the hard-core unemployed. *Rehabilitation Psychology*, 1973(Fal), Vol 20(3), 116-120.—75 experimental Ss, mean age 25 yrs and mean IQ 83, received 15-min daily video playback of their work behavior, while a control group received 15 min of counseling daily. Variables measured included production, time working, socializing, and distractibility. After 15 days the experimental group showed significant improvement on all variables except distractibility, while the controls did not improve significantly on any variable. Informal short-term follow-up on job placement showed a better job retention rate for experimental Ss.—*Journal abstract*.

3870. Iglitzin, Lynne B. (U Washington) A case study in patriarchal politics: Women on welfare. *American Behavioral Scientist*, 1974(Mar), Vol 17(4), 487-506.—Contends that the institution of public welfare reinforces society's feminine stereotype by supporting the traditional wife-mother role, enforcing outdated standards of morality, maintaining the "women's work" orientation, etc. Policy recommendations to counteract patriarchal welfare regulations are made. (21 ref)

3871. Johnson, Roosevelt. (Howard U. Inst for Urban Affairs & Research) A counselor education outreach program: Serving the black inmate. *Journal of Non-White Concerns in Personnel & Guidance*, 1974(Jan), Vol 2(2), 80-85.—Assessed the independent variable of age for interaction with other dependent variables and demographic data to ascertain the implications for counseling reformatory-type inmates. 200 men in an Ohio prison school system (academic high school and vocational shops) were introduced to Outward Bound, a program designed to provide a prerelease program for inmates of Ohio reformatories with Ohio State University graduate counselor education students as the chief program agents. Inmates were administered a 2-part questionnaire that solicited demographic information which would assist incoming teacher-counselors in becoming acquainted with prospective clients and which determined the areas in which inmates needed help with respect to the prerelease activities. Results show that age did not indicate the kind of academic assistance an inmate needed with respect to remediation when such remediation was categorized into discipline and skill areas. It is concluded that a program such as Outward Bound is viable in view of the characteristics and needs expressed by the inmates.—M. E. Pounsel.

3872. Keskiner, Ali & Zalcman, Marilyn. (U Missouri, Medical School, Inst of Psychiatry) Returning to community life: The foster community model. *Diseases of the Nervous System*, 1974(Sep), Vol 35(9), 419-426.—Describes the rationale, administration, and goals of the Foster Community Project designed to facilitate the return of psychiatric patients to the community. In contrast to traditional mental health rehabilitation programs, the foster community assumes an active role and works in partnership with the hospital in the rehabilitation process. The program is sponsored by the community through a nonprofit corporation, which assumes publicity, placement, and feedback functions. Steps in determining the suitability of a particular community are described, along with the role of the hospital, its prereturn resocialization program, and patient selection criteria. Results of a demonstration project are presented in terms of community response, success of patient placements, staff training, and implementation feasibility.—L. Gorsey.

3873. Kowalska, Barbara. (U Warsaw, Inst of Penal Law, Poland) [Recidivism among boys discharged from correctional institutions.] (Polh) *Przegląd Penitencjarny i Kryminologiczny*, 1972, Vol 10(1), 28-39.—Examined the court records of 7,439 boys discharged on probation from all correctional institutions in Poland 1963-1967 to see how many had again been deprived of freedom. Over a follow-up period of 3-7 yrs, 36% were sentenced to further detention. Most of the later offences were committed during the 1st 4 yrs after leaving the institution, and 20% were committed during the 1st 18 mo. Correctional institutions were classified into 8 categories according to the age of the boys incarcerated and the facilities available. Recidivists were found more often among the youngest and most delinquent boys and those who had psychological abnormalities. (French summary)—A. Z. Arthur.

3874. Martin, Garry L. (U Manitoba, Winnipeg, Canada) **The future for the severely and profoundly retarded: Institutionalization? Normalization? Kin care? Foster homes?** *Canadian Psychologist*, 1974(Jul), Vol 15(3), 228-241.—Examines some of the anti-institution and pronormalization statements as they pertain to rehabilitating severe and profound retardates. A "home-style" community residence for rehabilitating former severe and profound retardates is described and compared to foster home placement. Although institutions have been under heavy attack, it is suggested that they might survive in a desirable way for many years if a new role in partnership with community rehabilitation programs is adopted. (French abstract) (22 ref)—*Journal abstract*.

3875. Meyer, Alfred; Irro, Franz & Rödszus, Rudi. (Hochschule der Deutschen Volkspolizei, Berlin, E Germany) **[Informative report on the activity of expert groups for the prevention of relapsing criminality and education of criminally endangered persons and the possibilities for the psychiatrist's effective participation.]** (Germ) *Psychiatrie, Neurologie und medizinische Psychologie*, 1974(Feb), Vol 26(2), 98-103.—Describes formation of some consultative groups in forensic medicine. These groups advise the police in solving sociopsychiatric problems, especially recidivism.

3876. Paul, Lyndell L. (Gestalt Inst, Los Angeles, CA) **The relevance of Gestalt therapy for social work.** *Clinical Social Work Journal*, 1973(Sum), Vol 1(2), 94-99.

3877. Sackheim, Gertrude. **The practice of clinical casework.** New York, NY: Behavioral Publications, 1974. 214 p.—Discusses the processes of intake, treatment, interpretation, and recording in clinical social work, as well as the special relationships of transference, dreams, and cultural factors to casework. Attention is given to treatment of adolescents and schizophrenics and to the practice of supervision and consultation.

3878. Sieg, Kay W. (U Florida) **Applying the behavioral model to the occupational therapy model.** *American Journal of Occupational Therapy*, 1974(Aug), Vol 28(7), 421-428.—Recommends the direct, conscious application of behavioral principles and procedures to occupational therapy. When occupational therapy terminology in planning a treatment program is compared to behavioral terminology in applying the behavioral equation, the treatment session becomes the disposition; the activity becomes the discriminative stimulus; the patient's performance becomes the response; the treatment plan the contingency; and the treatment goal the consequence. To systematically apply these behavioral techniques, the therapist must understand the basic systems of applied behavioral analysis as well as the procedures for designing a behavior modification project that includes (a) identifying the terminal behavior; (b) timing, counting, recording and charting; (c) selecting the reinforcer; (d) choosing a fixed or interval schedule of reinforcement; and (e) shaping, chaining, and modeling to establish new behaviors.—*Journal abstract*.

3879. Tyler, Nancy B.; Kogan, Kate L. & Turner, Patricia. (U Washington) **Interpersonal components of therapy with young cerebral palsied.** *American Journal of Occupational Therapy*, 1974(Aug), Vol 28(7), 395-400.—Evaluated the interactive behaviors of 10 preschool

children with cerebral palsy, their mothers, and therapists, in a longitudinal study. 6 interaction sessions were recorded and processed for each pair of Ss. 2 sessions of unstructured play between mother and child, 2 sessions of therapy conducted by the mother, and 2 sessions of therapy conducted by the therapists were studied. These 6 sessions were recorded and evaluated 3 times at 10-month intervals. Each member of the dyad was rated on scales for status, affect, and involvement. Group results indicate significant differences in behaviors of mothers, children, and therapists when situations were compared. Differences over time were also identified.—*Journal abstract*.

3880. Wendland, Leonard V. (U Arizona, Coll of Education, Rehabilitation Ctr) **The measuring of patient cooperativeness.** *Rehabilitation Psychology*, 1973(Fal), Vol 20(3), 121-125.—Describes the use of 3 scales to quantify patient behaviors which are related to cooperativeness. Each scale consisted of 30 items depicting some aspect of cooperative-uncooperative behavior. Each item, or "behavior descriptor," was contributed by a person professionally associated with a rehabilitation program. The scale value of each item was determined by Thurstone's technique.

3881. Zaretsky, Herbert H.; Ince, Laurence P. & Lee, Mathew H. (New York U, Medical Ctr, Goldwater Memorial Hosp) **Hansen's disease in a rehabilitation hospital: A preliminary report.** *Rehabilitation Psychology*, 1973(Sum), Vol 20(2), 108-112.—Presents 2 case histories of patients with leprosy (Hansen's disease).

#### Hospital Programs & Hospitalization & Institutionalization

3882. Anthony, William A. & Buell, Gregory J. (Boston U) **Predicting psychiatric rehabilitation outcome using demographic characteristics: A replication.** *Journal of Counseling Psychology*, 1974, Vol 21(5), 421-422.—Attempted to replicate G. J. Buell and W. A. Anthony's (see PA, Vol 51:3600) finding that psychiatric hospital recidivism could be predicted by number of previous hospitalizations, and that posthospital employment could be predicted by employment history. Multiple linear regression analyses of data from 79 released psychiatric patients support the findings of the original study for posthospital employment but not for recidivism. Based on this replication and T. W. Lorei and L. Gurel's 1973 study, the usefulness of attempting to predict recidivism from demographic data must be questioned.—*Journal abstract*.

3883. Bath, Kent E. & Smith, Stuart A. (Galesburg State Research Hosp, Mental Retardation Unit, IL) **An effective token economy program for MR adults.** *Mental Retardation*, 1974(Aug), Vol 12(4), 41-44.—Presents data on a token economy program conducted with 17 19-51 yr old female institutionalized retardates. The program produced increased desirable behavior and maintained low levels of undesirable behavior when the system was fully intact. It was found, however, that an unplanned period of program disruption (during which time the regular ward attendant was absent) had profound deteriorative effects on the behavior of the residents. The major effect of this inconsistency was a dramatic increase in undesirable behavior, though some decrease

in desirable behavior was also observed.—*Journal abstract.*

3884. Bieliauskas, Linas A. & Webb, James T. (Ohio U) **The Social Readjustment Rating Scale: Validity in a college population.** *Journal of Psychosomatic Research*, 1974(Apr), Vol 18(2), 115-123.—Attempted to validate the findings by Batlis et al that a modified form of the Social Readjustment Rating Scale (SRRS) differentiates between college students who had been hospitalized in the previous 6 mo and those who had not. Ss were 116 females and 137 males who completed a paper-and-pencil test. Test items included 20 demographic variables, 42 items of the standard SRRS form, and 46 items of the college-modified form. While the college-modified SRRS provided slightly greater differentiation between the 2 groups than the standard SRRS, the difference was not significant. Special item weighting did not significantly alter the results. The findings of previous studies were confirmed; however, the predictive utility of the test is deemed to be poor. (18 ref)—*W. G. Shipman.*

3885. Bill, Arthur. (Federal Political Dept, Swiss Federal Council for Disaster Relief, Berne) **The Pestalozzi Children's Village in Trogen, Switzerland.** *Hospital & Community Psychiatry*, 1974(Sep), Vol 25(9), 599-601.—Presents a historical view of a Swiss children's village established for World War II orphans; residents are now victims of social conditions or new international conflicts. The goal of the village is to provide educational and vocational training that will enable the children to support themselves and promote the ideas of international cooperation in their home countries. The village's 13 national houses are managed by houseparents who are responsible for the educational and social training of the children. Classes are conducted in the children's native tongue as well as in German, the village language. Results of an inquiry conducted 5 yrs ago are provided and indicate the employment status and location of many of the former residents.—*Journal abstract.*

3886. Blackman, Sheldon & Catalina, Don. (North Richmond Community Mental Health Ctr, Research & Evaluation Services, Staten Island, NY) **Relationships between ratings of improvement and ethnicity, age and gender: II. Some further analyses.** Staten Island, NY: North Richmond Community Mental Health Center, 1974. 2 p.—An analysis of the findings of a 1973 title report reveals that (a) nonwhite, male, and under-30 patients are less likely to be related as "improved" at discharge; (b) patients under 30 and nonwhite patients present milder problems; and (c) the duration of treatment is significantly shorter for males and nonwhites.

3887. Büttner, Christian. **[Social insecurity in the behavior of institutionalized boys.]** (Germ) *Praxis der Kinderpsychologie und Kinderpsychiatrie*, 1974(Apr), Vol 23(3), 103-107.—Presents a questionnaire to estimate social insecurity in residents of boys' homes. Experts collected 42 items describing situations of increasing difficulty with respect to social insecurity. The item pool was administered to 11 adolescents. The questionnaire can be applied to the construction of an individual hierarchy of situations for use in assertive training.

3888. Clarke, Michael & Waller, Jane. (St Thomas's Hosp Medical School, London, England) **Descriptive**

**studies of a psychiatric hospital population.** *British Journal of Psychiatry*, 1974(Aug), Vol 125, 208-209.—Discusses 3 methods which were used to describe in gross detail features of a specific psychiatric hospital population: (a) routine data which were misleading unless such factors as changes in catchment area were considered; (b) census information which showed a large, long-stay, elderly population; and (c) a cohort study which demonstrated that only 5% of the patients admitted during 1968 were still inpatients after 2 yrs.

3889. Cohen, Melvin & Klein, Donald F. (Long Island Jewish—Hillside Medical Ctr, Glen Oaks, NY) **Posthospital adjustment of psychiatrically hospitalized drug users.** *Archives of General Psychiatry*, 1974(Aug), Vol 31(2), 221-227.—Compares the in-hospital and posthospital behavior of 4 groups of 203 15-25 yr old psychiatric patients with either negative, mild, moderate, or heavy drug use histories. Measures of in-hospital behavior, assessments of covert drug use, and sociometric evaluations of social affiliations indicate that the greater the drug use before hospitalization, the more likely the patient would continue drug use within the hospital and associate with primarily other drug users. The posthospital measure of community adjustment and degree of drug use, as determined by a 6-mo follow-up interview, indicates that in-hospital drug use and social affiliations predict posthospital drug use only for those patients with a history of heavy drug use and that only among this latter group is posthospital drug use related to poor posthospital adjustment.—*Journal abstract.*

3890. Corry, Suzanne; Sebastian, Vivian & Mosey, Anne C. (Bellevue Psychiatric Hosp, New York, NY) **Acute short-term treatment in psychiatry.** *American Journal of Occupational Therapy*, 1974(Aug), Vol 28(7), 401-406.—Considers the role of the mental health worker in acute, short-term care of psychiatric patients. The following goals of acute treatment are identified and discussed: orientation to the hospital, adjustment to somatic treatments, satisfaction of current needs, opportunity for meaningful communication, maintenance of present functioning, health education, problem-solving for immediate stress-provoking life situations, and readjustment to community living. Sections on management of symptoms and drug side effects are included. The approach is pragmatic and does not take a position as to the nature of mental illness.—*Journal abstract.*

3891. De Caro Orzalesi, Bianca et al. (U Rome, Inst of Psychiatry, Italy) **[The experience of a discussion group in a university hospital ward.]** (Ital) *Rivista di Psichiatria*, 1973, Vol 8(5), 509-540.—Describes a continuing group which consists of 9-14 patients, 4-6 physicians, nurses, and at least 1 social worker. The group was conceived as a place for 2-way communication and exchange of ideas. The topics discussed and the oral tradition developed enhance ward culture and promote autodetermination of the group. The group has occasionally become the core activity of the ward. Social learning has been used to establish a therapeutic atmosphere. Percentages of patient recovery are compared with percentages of attendance.—*Journal summary.*

3892. Doron, Roland. (U Bordeaux, France) **[Clinical observations of juvenile psychopathology.]** (Fren) *Psychologie Française*, 1972(Jun), Vol 1(1-2), 3-9.—Studied

the characteristics of 210 adolescent males who had been in a residential treatment center as these factors were related to favorable and unfavorable treatment outcome observed approximately 3 yrs after discharge from the center. Ss were of average IQ, and the most frequent diagnosis had been character disturbance. Favorable outcome, defined as the ability to function and survive without external assistance in a normal environment, was noted for 75% of the Ss. There was no obvious relation between type of disturbance and outcome. Significantly related to favorable outcome ( $p < .01$ ) were the presence of both parental figures while the S was 4-6 yrs old, a "passive personality" (carelessness and imprecision of gestures and thoughts), and a residence longer than 1 yr at the center. Significantly related to unfavorable outcome ( $p < .01$ ) were early traumatic separation from the mother, institutionalization for more than half of the S's life prior to referral to the center, and weak "mental tonus" (lack of perseverance and inability to channel one's energy).—A. Blasi.

3893. Dy, Antonio J. (Yale U, Medical School) **Correctional psychiatry and phase psychotherapy.** *American Journal of Psychiatry*, 1974(Oct), Vol 131(10), 1150-1152.—Discusses the evolutionary nature of psychiatry in correctional institutions and describes one approach to treating prison inmates that focuses on the different phases inmates go through from the time they are apprehended to the time they are released from prison. These phases include the initiation phase which covers the time from arrest to initial jail confinement, the disorganization phase which covers the time before the trial and sentencing, the short incarceration phase, the long incarceration phase, the parole phase, and the prerelease phase. Therapeutic guidelines for dealing with the varying degrees of hostility, anxiety, and other emotions and behaviors experienced by the inmate during these phases are presented.—L. Gorsey.

3894. Goldfarb, William. (Jewish Board of Guardians, Henry Huttenlocher Ctr for Child Research, New York, NY) **A follow-up investigation of schizophrenic children treated in residence.** *Psychosocial Process*, 1970, Vol 1(1), 71 p.—Evaluated the ego status and social adjustment of 37 male and 11 female schizophrenic children. Outcome at follow-up (average of 7 yrs 1 mo following discharge from the residence) was related to ego status at admission to treatment, ego status at discharge, and psychosocial adjustment of the child's family. (32 ref)

3895. Handy, Imena A. (VA Hosp, Brecksville, OH) **Judgments of release readiness as related to discharge from a neuropsychiatric hospital.** *Community Mental Health Journal*, 1974(Sum), Vol 10(2), 198-204.—Determined whether judgments of release readiness are related to discharge. Ss included 465 male schizophrenic patients continuously hospitalized in a Veterans Administration hospital for a minimum of 30 days. Findings show that (a) over the 4-yr period, the differences in percentages discharged between the "ready" and "not ready" groups were statistically significant; (b) judgments of release readiness were significant in relationship to discharge or nondischarge of patients; and (c) patient's previous hospitalization was significant in relationship to release readiness judgments and discharge for those judged ready but not for others.—*Journal abstract*.

3896. Henisz, Jerzy E.; Goldblatt, Phillip B.; Flynn, Hulda R. & Garrison, Vivian. (Yale U, Medical School) **A comparison of three approaches to patient care appraisal based on chart review.** *American Journal of Psychiatry*, 1974(Oct), Vol 131(10), 1142-1144.—Tested a 3-level approach to auditing charts of psychiatric patients (review by clerks, research assistants, and clinical consultants) against 2 other methods. There were no significant differences among the 3 methods in scores of adequacy of patient care and adequacy of documentation. While there is a need for more research in the area of assessing quality of patient care, research assistants and other nonclinician reviewers can make a contribution to peer review.—*Journal abstract*.

3897. McGarry, A. Louis & Parker, Lawrence L. (Massachusetts Dept of Mental Health, Div of Legal Medicine, Boston) **Massachusetts' operation Baxstrom: A follow-up.** *Massachusetts Journal of Mental Health*, 1974(Spring), Vol 4(3), 27-41.—Conducted a follow-up study of 234 inmates at an institution for the criminally insane who were transferred to open mental health institutions. The Ss tended to be elderly and had spent nearly half their adult lives incarcerated. 33 mo after transfer, 33% were successfully discharged and only 7% were absent without leave. Recidivism was low (1 felony).—A. Krichev.

3898. Moura, Gilberto V.; Pereira, Lúcia F. & Santos, Derlange K. (Universidade Federal de Pernambuco, Recife, Brazil.) [Integration of a psychiatric unit in a general hospital.] (Port) *Neurobiologia*, 1974(Jan), Vol 37(1), 79-82.—Describes the consultation service and functioning of the psychiatric unit with respect to inpatient and outpatient referrals from other departments in a Brazilian hospital. From analysis of numbers, percentages, and nosological distribution of the patients, it is concluded that the unit is insufficiently integrated within the hospital although some improvement is seen in the outpatient department.

3899. Muller, Walter J. (La Amistad, Winter Park, FL) **La Amistad: Starting an inpatient program for severely disturbed young adults.** *Hospital & Community Psychiatry*, 1974(Sep), Vol 25(9), 587-590.—Describes the efforts of a private psychiatrist to establish a model inpatient program for young people with schizophrenia-related illnesses. The program is designed to provide residential treatment for up to 6 male and 6 female 16-22 yr old patients. The main treatment method is behavior modification, though family and group therapy and group activities are also used. Follow-up 44 mo after the program's opening shows that about 1/3 of 70 former residents were considered "improved" or "much improved."—*Journal abstract*.

3900. Murphy, I. C. & Elder, Robin. (Nether Edge Hosp, Sheffield, England) **Treatment of a psychotic non-autistic child.** *Acta Paedopsychiatrica*, 1974, Vol 40(5), 190-195.—Describes the case history of a child with a late-onset psychosis who made good recovery during 1 yr of hospital care. Therapy included drugs, an active therapeutic community, an educational system designed for autistic children, and psychotherapy for the mother. Recording the times of treatment and improvement allowed assessment of the contribution of the several

treatment variables. However, improvement may have been spontaneous.—*G. Rubin-Rabson.*

3901. **Peretti, Peter O.** (Kennedy-King Coll, Chicago, IL) **Precipitating factors of readmission of psychiatric patients.** *Community Mental Health Journal*, 1974(Spring), Vol 10(1), 89-92.—Attempted to determine the precipitating factors of rehospitalization for 100 patients who had formerly been hospitalized for mental illness and had been rehabilitated in a halfway house. Ss had been terminated by the halfway house after having successfully completed its vocational and social programs for a period of approximately 1 yr. Results of interviews with the patients indicate that they had realistic viewpoints regarding the significance of employment, but a nonrealistic viewpoint about the significance of self. A profile of these readmitted patients shows that they were most likely to have no job, to be loners, and to have negative self-concepts.—*Journal abstract.*

3902. **Remnet, Valerie L.** (Family Service of Long Beach, Homemaker Services, CA) **A group program for adaptation to a convalescent hospital.** *Gerontologist*, 1974(Aug), Vol 14(4), 336-341.—Describes a group program in a convalescent hospital established to help the elderly patient make a positive adaptation to the hospital. A 42-member patient discussion group, The Pacesetters (named by the patients themselves), met weekly. It was observed that when the patients participated in such a program, social interaction among patients, families, and staff increased. This socialization created a milieu in which the elderly person could adapt more easily to his new role as a patient in a long-term care facility. (24 ref)—*Journal abstract.*

3903. **Scher, Maryonda E.; Volberding, Noel K.; Helgerson, Steven D. & Ruoff, Paul A.** (VA Hosp, Seattle, WA) **The effect of a national crisis on patient government.** *Hospital & Community Psychiatry*, 1974(Sep), Vol 25(9), 607-609.—Describes a breakdown in patient government on the psychiatric ward of a Veterans Administration hospital following the resignation of the Vice-President of the US. It is suggested that the psychiatric ward is an ideal laboratory in which to study the reactions of human groups to external forces.

3904. **Serban, George & Thomas, Alexander.** (New York U, Medical Ctr) **Attitudes and behaviors of acute and chronic schizophrenic patients regarding ambulatory treatment.** *American Journal of Psychiatry*, 1974(Sep), Vol 131(9), 991-995.—Examined the attitudes toward and behavioral compliance with posthospitalization treatment and adjustment of 641 acute and chronic schizophrenics of both sexes. Results reveal a marked discrepancy between positive attitudes toward medication, outpatient care, and employment and noncompliance with these therapeutic interventions. An examination of the relationship between compliance with ambulatory treatment and the need for rehospitalization revealed that, at least for the chronic schizophrenic patient, such compliance led to a diminished need for rehospitalization. Findings are discussed in terms of the different views of their illness which these patients may hold. Implications for psychiatric treatment of posthospitalized patients are explored. (16 ref)—*Journal abstract.*

3905. **Smith, Alexander B. & Berlin, Louis.** (John Jay Coll of Criminal Justice, City U New York) **Treating the**

**criminal offender: Issues and problems.** Dobbs Ferry, NY: Oceana, 1974. ix, 372 p.—Assesses past developments and contributions in the correctional field and reviews and evaluates new proposals. Among the issues discussed are probation and parole, punishment vs treatment, traditional and innovative group therapies, drug addiction, sexual offenses and their treatment, the violent offender, alcoholism, marital problems and crime, and the pathology and psychology of gambling.

3906. **Wikler, Lynn & Stoycheff, Judy.** (Neuropsychiatric Inst, Los Angeles, CA) **Parental compliance with postdischarge recommendations for retarded children.** *Hospital & Community Psychiatry*, 1974(Sep), Vol 25(9), 595-598.—Used parental compliance with postdischarge recommendations as the criterion for successful intervention in a study conducted on a short-term inpatient ward for retarded children. A study of 217 recommendations to 80 families was based on the hypothesis that parents will be more likely to follow through on recommendations if they (a) feel comfortable with the diagnosis of the child's problem, (b) feel that the professional caretakers are concerned about the child both during and after hospitalization, and (c) feel relieved of stress and helped by the therapy. Parents' attitudes and the extent to which they had followed the recommendations were assessed in telephone interviews at least 3 mo after the child was discharged. Results indicate that 3 variables were significantly correlated with compliance: agreement with the diagnosis, postdischarge contact with the ward, and preadmission stresses of caring for the child.—*Journal abstract.*

## EDUCATIONAL PSYCHOLOGY

3907. **Acklaw, John & Labon, Don.** **School-based therapy: A pilot scheme.** *Association of Educational Psychologists Journal & News Letter*, 1971(Fal), Vol 2(10), 35-39.—Describes a pilot scheme to provide school-based help for disturbed predelinquent English primary school children. Activity group therapy was offered by teachers who were selected by the head teachers of the schools concerned and given in-service training conducted by educational psychologists. Children were selected by the head teacher and the "adjustment group" teacher together, and were predominantly those whose disturbance was expressed in behavior of the overtly difficult type (e.g., restlessness, unsettledness, and hostility). Evaluation of the project indicated that this approach provided benefits for the majority of children included, and that such a program exerted a beneficial influence on the general morale and atmosphere within the schools.—*I. L. Zimmerman.*

3908. **Antonouris, George.** (U Nottingham, School of Education, England) **Subsequent careers of teachers trained as counsellors.** *British Journal of Guidance & Counseling*, 1974(Jul), Vol 2(2), 160-170.—Presents a detailed analysis of data concerning 87 Ss who work as counselors within schools, and compares this counselor data with that obtained from a sample of 34 college students on full-time courses. The senior positions which counselor-trained people have achieved in schools are presented, and those employed in other noncounseling

positions within the school are examined. The various routes of possible mobility outside the school milieu which are open to trained counselors are indicated. A group of teachers interested in counseling who have not undergone full-time counselor training is briefly discussed, and various questions raised by the study are posed.—*Journal abstract.*

3909. Baker, Gwendolyn C. (U Michigan, School of Education, Multicultural Program) **Multicultural training for student teachers.** *Journal of Teacher Education*, 1973(Win), Vol 24(4), 306-307.—Conducted a 2-wk multicultural workshop for 299 student teachers. Pre- and posttests showed significant differences in the perceptions of ethnic groups held by students on both pro-irrational and anti-irrational scales. Since perceptions can be altered, teacher training institutions must assume responsibility for such training.

3910. Barkley, William D. & Dickenson, Gary. (Canadian Wildlife Service, Ottawa, Ontario, Canada) **The design and evaluation of a rural land use planning simulation game.** *Adult Education*, 1974, Vol 24(4), 280-292.—Developed a simulation game using land capability data to teach rural adults certain principles and competencies required for effective land use planning. Evaluation instruments were constructed and the simulation game was revised in a pilot study. A field project was carried out in the East Kootenay area of British Columbia where 40 rural people residing on land holdings of 50 or more acres participated in the game. Pre- and posttest mean scores were compared and 3 scores showed statistically significant gains, while the remaining changes were nonsignificant but in the hypothesized direction. Test scores correlated significantly with some characteristics of the participants and with some factors related to success in playing the game. Factors that may have influenced the results are discussed, and it is concluded that simulation gaming is potentially useful for educating rural adults about land use planning. (21 ref)—*Journal abstract.*

3911. Bayer, Alan E. (American Council on Education, Office of Research, Washington, DC) **Teaching faculty in academe: 1972-73.** *ACE Research Reports*, 1973(Aug), Vol 8(2), 68 p.—Presents a statistical summary and descriptive highlights of the 1972 American Council on Education survey of college and university faculty. Over 40,000 faculty, whose responses were weighted to represent the entire population of teaching faculty, answered a comprehensive questionnaire dealing with their demographic characteristics, work activities, attitudes, and opinions. Initial tabulations suggest general satisfaction with teaching and endorsement of academic reform. Typical faculty activities included 3 courses per term, research, and scholarly writing. More detailed analyses are currently underway.—*J. B. Francis.*

3912. Berger, Michael L. (Fordham U, School of Education, Div of Curriculum & Teaching) **Why not specialists in suburban education?** *Journal of Teacher Education*, 1973(Win), Vol 24(4), 285-288.—Points out the need to train teachers specifically for suburban schools, as they are trained for teaching in the inner cities. Courses in urban education are necessary but equal concern must be directed to the school-age youngsters who do not live in urban America.

3913. Bjerstedt, Ake. Department of Educational and Psychological Research, Malmö: **Some notes on current activities.** *Pedagogisk Dokumentation*, 1973(Dec), No 22, 34 p.—Presents information on the organization, research program, and reporting system of the Department of Educational and Psychological Research whose main activities are related to educational problems, researcher training in education, and participation in teacher training. Brief summaries of 21 research projects are included.

3914. Dosajh, N. L. (Government Coll of Education, Chandigarh, India) **The use of multiple regression equation in the selection of trainees.** *Indian Journal of Psychometry & Education*, 1972(Dec), Vol 3(2), 59-65.—Used 7 variables derived from previous academic achievements and personality traits (e.g., emotional maturity) to predict academic performance of 251 students in the Bachelor of Education course at a college in India. The prediction equation accounted for 10.2% of the variance in academic performance, suggesting that (a) correlates of effective teaching are not known and (b) much greater sophistication of the predictors is warranted before clear predictions can be made. (20 ref)—*J. B. Francis.*

3915. Flincher, Cameron. (U Georgia, Inst of Higher Education) **The paradox and counterpoint of public expectations for higher education.** *Educational Record*, 1974(Spr), Vol 55(2), 101-109.—Considers 4 issues which illustrate the American public's ambivalent expectations of higher education: (a) diversity vs unity, (b) competition vs accommodation, (c) involvement vs detachment, and (d) efficiency vs effectiveness. Although all of these are reflections of the total American character, the paradox of involvement vs detachment is perhaps the central paradox of the higher education situation: this contradiction comes from the changing role of the research community, the concept of community colleges, and the continuing pressure for relevance. Examples of these issues are presented and some of the suggested solutions for problems are considered: (a) attempts to compromise or average out toward a golden mean ignore the exact nature and intense polarities of the differences, (b) the egocentrism of different educational factions will not allow the establishment of a hierarchy of priorities, and (c) continuing to attack the problems on a piecemeal basis may actually be the best solution. *R. Gutzke.*

3916. Gaudia, Gill. (State University Coll New York, Fredonia) **The Piagetian dilemma: What does Piaget really have to say to teachers?** *Elementary School Journal*, 1974(May), Vol 74(8), 481-492.—Contends that the contribution of Piaget to educational theory and practice is minimal. Almost none of his writings deal directly with education and pedagogy themselves. According to Piaget, development is the process essential to learning and each element of learning occurs as a function of total development. The teacher's dilemma is whether to be wary of Piaget's conclusions or to agree with the current acceptance of his viewpoint. Piaget refuses to be pinned down on the question whether or not the cognitive development of a child can be altered by formal intervention, labeling this problem an "American question." Educators are confused about his position as to the relative influence of heredity and environment

on development. Piaget's comment on this problem has frequently been, "I refuse to be concerned." (39 ref)—A. J. Ter Keurst.

3917. Gilly, Michel. (CNRS Lab de Psychologie Scolaire et Lab de Psychologie Associé, U Provence, France) [Educational psychology: Reflections on the development of practices and relationships between school and psychology.] (Fren) *Cahiers de Psychologie*, 1972, Vol 15(3-4), 135-141.—Reviews the development of educational psychology in France and discusses its current functions, including identification of the retarded and deviant, counseling, and research. Research is seen as still strongly influenced by past constrictive approaches but as currently evidencing growing concern with interpersonal relationships and the study of functional interactions throughout the pupil's school career. (English summary) (15 ref)—E. E. Brown.

3918. Henney, Maribeth & Mortenson, W. Paul. (Iowa State U) What makes a good elementary school teacher? *Journal of Teacher Education*, 1973(Win), Vol 24(4), 312-316.—A group of parents, teachers, and administrators observed videotapes of classroom reading lessons given by various elementary teachers, and described positive and negative teaching characteristics. The 7 categories of desirable qualities, derived from comments by the panel, are listed and discussed.

3919. Hibbert, K. A. Teachers' attitudes towards psychologists. *Association of Educational Psychologists Journal & News Letter*, 1971(Fal), Vol 2(10), 25-32.—Developed and tested a 33-item scale to measure teachers' attitudes toward educational psychologists, with open-ended questions appended for teachers' comments. Results of its administration to 147 respondents are described. Overall, teachers seemed to feel that psychologists should give less time to assessment and more to individual guidance and treatment. It is suggested that guidance in reorganizing the work of the school psychological service may be supplied from such feedback of information.—*Journal summary*.

3920. Kaplan, David M.; Smith, Aaron & Grobstein, Rose. (Stanford U, Medical Ctr, Div of Clinical Social Work) School management of the seriously ill child. *Journal of School Health*, 1974(May), Vol 44(5), 250-254.—Discusses management problems that the seriously ill child of school age poses for school administrators and teachers. 9 management and policy issues commonly raised by the seriously ill child for school personnel are cited, along with 6 case summaries of the leukemic child and the reactions caused by these children in the home and in the classroom. Suggestions for successfully coping with the seriously ill child, for both the family and the teacher are presented. It is concluded that those teachers and other school health personnel who can face the painful realities of serious illness and experience the loss and sorrow involved will best be able to help the seriously ill child in his school experience.—R. J. Ambrosino.

3921. Katz, Harvey P.; Sorrentino, Jean & Rodriguez, Alejandro. (Johns Hopkins U, Medical School) Pediatric-child psychiatry team consultation in a community early childhood education center. *Young Children*, 1973(Apr), Vol 28(4), 237-243.—Describes a 2-yr experience with a consultation service which attempted to integrate health

services at a privately-financed early childhood education center. A case report by a pediatrician-psychiatrist team is provided.

3922. Keel, Raymond E. & Rowland, G. Thomas. (Inst for Epistemic Studies, Fort Worth, TX) How children learn: A developmental approach. *Elementary School Journal*, 1974(May), Vol 74(8), 501-507.—Compares the teaching process to an evaluation procedure in educational research. When the objectives of education are expressed in behavioral terms, the ambiguous words "understanding," "appreciation," and "knowing" are replaced by objective ones, such as "sorting" and "stating." 2 theories of learning are presented. B. F. Skinner's model assumes that learning occurs, via operant conditioning, as a response to rewards. Logically, this approach excludes the concept of human freedom and decision making. An approach by I. Illich suggests that learning may be more a matter of chance than of planning. Important factors in the learning process are motivation and social influences on the transmission of cultures. Children learn by experimenting individually with the environment. In contrast to the limited range of behavior among lower animals, the human being exhibits such varied behavior that it is nearly impossible to determine a "maximum potential" or a "genetically endowed limitation" of an individual child. (17 ref)—A. J. Ter Keurst.

3923. Kikuchi, Akio. [Q-typing of the images of the ideal teacher.] (Japn) *Japanese Journal of Educational Psychology*, 1972(Sep), Vol 20(3), 184-189.—Administered the Japanese adaptations of the Gordon Survey of Interpersonal Values and Gordon Survey of Personal Values to 19 groups of 353 Japanese students, teachers, and parents to determine their perceptions of the image of an ideal teacher. The image of an ideal teacher shared by all groups was characterized by benevolence and goal orientation, and not by recognition, practical-mindedness, and variety. Independence and decisiveness were highly valued by students, whereas conformity and orderliness were valued by parents. Younger students tended to agree with the adults' views more than did older students.—S. Choe.

3924. Kluge, K. J. (Rheinland Pedagogical Coll, Cologne, W Germany) [Report on a German-French seminar on the training of remedial and special-school teachers.] (Germ) *Praxis der Kinderpsychologie und Kinderpsychiatrie*, 1974(Apr), Vol 23(3), 107-112.—Describes how seminar participants were actively involved in group processes and attended lectures on results of research in social psychology and special education. Under the theme "We also belong to Europe," compensatory programs for outgroups were developed and tried.

3925. Leyba, Charles F. (California State U, Los Angeles) Cultural identity: Problems and dilemmas. *Journal of Teacher Education*, 1973(Win), Vol 24(4), 272-276.—Explores issues that must be faced if educational institutions and ethnic communities seriously intend to develop multicultural education. A description of culture suited to the present analysis is developed and applied to relations between majority and minority ethnic groups. Control and cultural erosion are considered, and specific cultural dilemmas are discussed.

3926. Pollard, W. Grosvenor. (U Tennessee) **Implications of the rank concession syndrome for adult education programs: An exploration in social roles and program effectiveness.** *Adult Education*, 1974, Vol 24(4), 255-269.—Discusses the "rank concession syndrome" theory and the theory of "ethnic boundaries," and applies them to the case of an American Indian group in rural Wisconsin. The aims and methods of successful adult education programs for lower income groups are discussed.
3927. Quereshi, M. Y.; Brennan, P. J.; Kuchan, A. M. & Sackett, P. R. (Marquette U) **Some characteristics of undergraduate majors in psychology.** *Journal of Experimental Education*, 1974(Sum), Vol 42(4), 65-70.—A questionnaire was filled out anonymously by 167 undergraduate majors in psychology. Ss provided information about age, sex, total credits, credits in psychology, grade point average (GPA), ranking of fields of interest, occupational use of the major, reasons for choosing psychology, intention to pursue graduate work, and application to and acceptance by graduate schools. Results indicate that (a) applied areas (abnormal, personality, and developmental) were overwhelmingly popular, (b) the occupational value of a BA degree in psychology was misunderstood, (c) GPA was insignificant as a determinant of admission into graduate programs, and (d) the subject matter itself was the most dominant reason for majoring in psychology.—*Journal abstract*.
3928. Röhm, Hartwig. [Punishment as a psychodynamic problem of the educator: An educational-psychological contribution on the theory and practice of punishment in education.] (Germ) *Praxis der Kinderpsychologie und Kinderpsychiatrie*, 1974(Feb), Vol 23(2), 56-62.—Discusses 2 concepts of punishment in education: (a) idealistic or social-anthropological concepts, which see punishment as retributive justice; and (b) behavioral concepts, which see it as the isolated administration of aversive stimuli. Both concepts are rejected as misrepresenting the psychology of punishment in the real educational situation. From a psychoanalytical standpoint, the effect of punishment is determined by the totality of the educational situation, and the initiation of punishment is determined not only by educational goals, but to a considerable extent by personal and psychodynamic characteristics of the educator. (27 ref)—*H. A. Euler*.
3929. Ryan, Thomas J. & Moffitt, Alan R. (Carleton U, Ottawa, Ontario, Canada) **Evaluation of preschool programs.** *Canadian Psychologist*, 1974(Jul), Vol 15(3), 205-219.—Reviews the somewhat discouraging results regarding the effectiveness of early childhood educational enrichment programs. It is suggested that one of the failings in this area has been in the development of suitable techniques for evaluation. The results of 3 previous studies are reported in which focus was on process evaluation rather than employing the experimental model. It is argued that descriptions of program content, descriptions of the consistent and inconsistent program goals as stated by the teachers, and demonstrations of the inconsistencies between program goals and teachers' behavior provides information which is more informative and more useful than the traditional experimental model when evaluating the effectiveness of preschool programs. (French abstract) (22 ref)—*Journal abstract*.
3930. Soh, K. C. (Inst of Education, Singapore) **Dogmatism and educational attitudes.** *Psychologia: An International Journal of Psychology in the Orient*, 1974(Mar), Vol 17(1), 20-24.—Attempted to determine whether dogmatism should be explicitly or implicitly equated, as is done in most studies, with authoritarianism. Prospective teachers of high and low dogmatism were compared as to their educational attitudes. The differences were related to cultural background and exposure to progressive educational ideas. Ss were 30 women, randomly selected from 2 classes, who were preparing to teach at the lower secondary level. Dogmatism was measured with an adapted version of Rokeach's Dogmatism Scale, Form E. Results show that the high-dogmatism group held more progressive educational attitudes. (15 ref)—*R. D. Nance*.
3931. Strike, Kenneth A. (Cornell U) **On the expressive potential of behaviorist language.** *American Educational Research Journal*, 1974(Spr), Vol 11(2), 103-120.—Treats 2 central concepts of behaviorism, peripheralism and associationism, as doctrines which place semantic and syntactical constraints on acceptable language for human discussion, and discusses how these doctrines affect the description of educational goals and methods. It is argued that peripheralism and associationism are philosophical ideas inherited from British empiricism, and that they are more appropriately treated as part of the philosophy of psychology than as testable empirical claims. The constraints that this philosophy places on a language render the language incapable of expressing some important educational goals, rule out some meaningful empirical hypotheses, and blur some essential ethical distinctions. (20 ref)—*Journal abstract*.
3932. Tate, Sean. (U Pittsburgh) **Anthropological perspectives on evaluation in development education.** *Interchange*, 1973, Vol 4(4), 24-34.—Argues that anthropology is an appropriate source from which to select concepts and methodology for evaluating educational institutions and programs in developing nations. Anthropology can contribute to the evaluation of individual change, of change in organizations, and of the evaluator himself. (75 ref)
3933. Wong, Martin R. & Wong, Joyce M. (U Minnesota) **Reinforcement in the British open classroom.** *Child Study Journal*, 1974, Vol 4(3), 135-143.—Observed the teacher verbal behavior of 2 London primary school open classrooms and categorized that behavior according to a 13-item categorization instrument. Special attention was paid to verbal behavior that could be classified as potentially reinforcing to students. Results indicate that major categories were Substantive Questioning (32.2%), Positive Feedback Giving (17.5%), Substantive Information Giving (16.5%), and Management Directions (13.3%). Teacher statements that could be classified as at least potentially reinforcing to students accounted for 19% of all teacher utterances. Results are compared with another similar study.—*Journal abstract*.

## School Administration &amp; Educational Processes

3934. Almgren, Eva & Gustafsson, Ery. **World citizen responsibility: Assessment techniques, developmental studies, material construction, and experimental teaching.** *Educational & Psychological Interactions*, 1974(Apr), No 48, 34 p.—Summarizes the "world citizen responsibility" project carried out at the Malmö School of Education. Extensive test batteries were constructed to study attitudes toward foreign groups and international relations. Among the older students more negative stereotypes were found, particularly towards minority groups and immigrants. Special teaching packages intended to increase the students' world citizen responsibility were developed and tested. Results give reason for optimism. (26 ref)—*Journal abstract*.

3935. Amigues, René; Bonniol, Jean-Jacques & Stievenart-di Martino, Conception. (U Provence, Marseille, France) [Study of verbal evaluations by teachers of pupils in 1st-year secondary school classes organized by group level.] (Fren) *Cahiers de Psychologie*, 1972, Vol 15(1-2), 29-42.—Studied the determining role of reinforcement (verbal evaluations) in 1st-yr secondary school classes (approximates US 6th grade) that were divided into high- and low-ability groups. Indexes of verbal evaluations given by teachers in French reading comprehension classes reflected number of evaluations, positive vs negative evaluations, and character of evaluations (interpretation, grammar, vocabulary, comment, discipline, and work directives). It was found that (a) Ss in the high group received more positive and fewer negative evaluations than did the low group; (b) teachers gave more discipline and work directives to pupils in the low group; and (c) the high group received more comments in the interpretation category than did the low group, while more of the evaluations in the low group pertained to grammar or vocabulary. Results support the hypothesis that the status of pupils is a determining factor in the quality and quantity of evaluations proffered by the teacher. (English summary)—E. E. Brown.

3936. Barfield, Vivian & Burlingame, Martin. (Colorado Women's Coll) **The pupil control ideology of teachers in selected schools.** *Journal of Experimental Education*, 1974(Sum), Vol 42(4), 6-11.—Examined the relationships between pupil control ideology and teacher sense of efficacy, bureaucratic level of school, and socioeconomic status (SES) of the students. The Political Efficacy Scale (A. Campbell et al) and the Pupil Control Ideology Form (D. J. Willower et al) were administered to 275 teachers in 9 schools stratified according to SES of clientele and bureaucratic level. Findings indicate that teachers in low-SES schools were more custodial toward pupil control than teachers in middle- or upper-SES schools. Additionally, teachers with low sense of efficacy perceived control of pupils more custodially than teachers with average or high perceptions of efficacy. Results suggest that control ideology may indicate the type of bureaucracy operating within the school.—*Journal abstract*.

3937. Barham, Carl S.; Price, Mary R.; Esham, Yolanda & Spradlin, Faye. (Prince Georges County Public School System, Upper Marlboro, MD) **Implementation of a simulation of change model for elementary students.** *Journal of Non-White Concerns in Personnel &*

*Guidance*, 1974(Jan), Vol 2(2), 71-78.—Discusses a Maryland suburban school system's plan to help prepare some of the elementary school students for the change that was precipitated by desegregation. A team of 3 elementary school counselors, a parent discussion-group leader, and a school psychologist conducted an experiment that attempted to have approximately 500 4th, 5th, and 6th graders, through experiencing group processes and change, assess and evaluate their feelings and behaviors as members of a group, as recipients of new members into their group, and as new members entering an ongoing, previously established group. Results of the 4-phase experiment indicate that (a) the experiential simulation of change model was effective with 6th graders and less effective with 4th graders unless they were quite intellectually and emotionally mature; (b) the model helped children understand change from a functional standpoint; (c) in the initial stages of Phase 1, student leaders, isolates, and other grouping patterns became readily identified as children grouped themselves according to preestablished patterns; and (d) 80% of the students gained insight into their behaviors and the behavior of others.—M. E. Pounsel.

3938. Bonniol, Jean-Jacques; Henry, Christine; Massonnat, Jean & Piolat, Michel. (U Provence, Inst of Didactics & Pedagogy, Marseille, France) [The Center for Teacher Training in Secondary Schools.] (Fren) *Cahiers de Psychologie*, 1972, Vol 15(1-2), 119-128.—Describes the 4-yr history of the Center for Teacher Training in Secondary Schools. During the Center's first 2 yrs, various training methods were tested; the training content was determined by the student teachers themselves. For the past 2 yrs, the focus has been on the concrete problems of the practicing teacher where different training activities (e.g., recitations and lectures) have brought together secondary school teachers who are on assignment and future teachers in initial training. This training has concentrated on theory and practice, initial training, and research-training.—*Journal abstract*.

3939. Bonniol, Jean-Jacques & Pendaries-Galera, Josette. (U Provence, Marseille, France) [Reflections on class organization by group level in the first cycle of secondary education in France.] (Fren) *Cahiers de Psychologie*, 1972, Vol 15(1-2), 105-117.—Attempts to explain the failure of a broad experiment dealing with equalization of opportunity in selected secondary schools in the south of France. It is pointed out that a policy of systematic penury—lack of material means, personnel, organization, and collaboration with competent auxiliary services (e.g., by social workers and primary school teachers)—can lead not only to failure of an experiment but also to ideological and political reinforcement of the policy. The only objectives attained correspond to the objectives assigned to National Education in the official Plan VI—early channeling of pupils into 1 of the 4 courses and aggravation of social segregation in the schools. (English summary)—*Journal abstract*.

3940. Bonniol, Jean-Jacques; Caverni, Jean-Paul & Nolzet, Georges. (National Ctr for Scientific Research, U Provence, Marseille, France) [Experimental training in evaluating scholastic tasks.] (Fren) *Cahiers de Psychologie*, 1972, Vol 15(1-2), 93-104.—Participants in training sessions attempted to establish standards on the varia-

tion in marks given by examiners to the same series of papers. Sessions were designed to define and clarify criteria, construct a uniform evaluation scheme, and decrease the differences of marks and rankings on a 20-point scale. Fewer differences were found between markers following the training sessions. There was less variation in marks given to artificially constructed papers than to those actually produced by students. (English summary)—*E. E. Brown*.

3941. **Bullock, Donald H.** (Catholic U of America) **Application of performance problem-solving to educational problems.** *Improving Human Performance*, 1973(Win), Vol 2(4), 245-262.—Applies performance problem-solving to the specific educational problem of reading deficiency. The general relevance of performance problem-solving for education is discussed in terms of its effect on the marketability of graduates, the cost-effectiveness of educational programs, and the drop-push-failout rate among students.—*Journal abstract*.

3942. **Centra, John A.** (Educational Testing Service, Princeton, NJ) **The relationship between student and alumni ratings of teachers.** *Educational & Psychological Measurement*, 1974(Sum), Vol 34(2), 321-325.—Determined that student and alumni ratings for 23 teachers correlated .75 (somewhat less for teachers rated only by graduates of their department). This substantial agreement between current students and alumni of 5 yrs regarding effective or ineffective teachers suggests a good deal of persistence in judgments of teachers by students.

3943. **Frankel, Edward & Kassirnov, Howard.** (Hofstra U) **Effects of required effort, perceived expertise, and sex on teacher compliance.** *Journal of Social Psychology*, 1974(Aug), Vol 93(2), 187-192.—Investigated the effect of school psychologists' required effort (moderate vs low), level of expertise ("Dr" vs "Mr"), and sex on teachers' compliance with their recommendations. 144 elementary school teachers served as Ss. The psychologists evaluated a child from each teacher's class and recommended that she send for materials which would help the child's perceptual and reading development. Results indicate that compliance varied directly with required effort but was unrelated to level of expertise and sex. It is argued that psychologists in schools may influence teachers as a function of legitimate power, whereas expert power is operative when dealing with the public.—*Journal abstract*.

3944. **Gardner, P. L.** (Monash U, Clayton, Vic, Australia) **Research on teacher effects: Critique of a traditional paradigm.** *British Journal of Educational Psychology*, 1974(Jun), Vol 44(2), 123-130.—Process-product studies of the effects of teacher behaviors upon pupil outcomes often employ class mean scores as measures of the outcome variable. Assuming that all the measures used are reliable, a zero correlation between the teacher measure and the pupil outcome implies that the teacher behavior being studied does not affect pupils in any lawful way. However, results of the present study, in which attitudes toward physics held by 1,014 students were assessed, indicate that such a conclusion may be faulty. It is argued that research on teacher effects should consider pupil variables; teacher behaviors and pupil outcomes may enter into lawful relationships with

one another, the nature of the relationship being different for different kinds of pupils.—*Journal abstract*.

3945. **Hanlon, Noel N.** (Hamilton Teacher's Coll) **Teacher personality and teacher effectiveness.** *Delta*, 1973(Jun), No 12, 30-37.—A review of studies on teaching effectiveness indicates that few significant findings have emerged because of the complexity of the problem. Definitions of personality and teaching effectiveness vary with the researcher, thus leading to contradictory results. Faulty research methodology often further complicates the issue. Despite the research limitations, an indirect relationship between personality and teaching effectiveness can be established. It is concluded that (a) specific descriptions of teachers be used in future research since teachers vary on dimensions such as age, experience, and sex; (b) student behaviors influence teaching behaviors such that effective teaching in 1 situation may not be effective in another situation; and (c) external variables (e.g., classroom setting and people other than students) may affect teaching behavior. Teacher personality is only 1 of many variables that influence teaching behavior. (27 ref)—*M. H. Apt*.

3946. **Jamieson, David W. & Thomas, Kenneth W.** (Management Responsibility Guidance Corp, Los Angeles, CA) **Power and conflict in the student-teacher relationship.** *Journal of Applied Behavioral Science*, 1974, Vol 10(3), 321-336.—Examined some parameters of power and conflict in the classroom. Questionnaire data were collected from 105 high school, 61 undergraduate, and 41 graduate students on their teachers' bases of power and their own methods of handling conflict with teachers. Results highlight the imbalance of power between students and teachers and the prevalent use of coercion by teachers at the high school and undergraduate levels. This use of coercive power was shown to be negatively related to student satisfaction, learning, and the extent to which teacher influence transcends the classroom. Despite considerable dissatisfaction, students at all levels reported relative passivity in attempting to change what occurs in the classroom. (42 ref)—*Journal abstract*.

3947. **Keith, L. Thomas; Tornatzky, Louis G. & Pettigrew, L. Eudora.** (Michigan State U) **An analysis of verbal and nonverbal classroom teaching behaviors.** *Journal of Experimental Education*, 1974(Sum), Vol 42(4), 30-38.—Attempted to (a) construct an operationally explicit instrument to measure verbal and nonverbal teacher-learner classroom behaviors and (b) determine the relationships among verbal and nonverbal teacher-learner behaviors. Videotaped observations of 43 teacher-interns in a federally sponsored teacher training program were conducted in the classrooms of 6 public elementary schools containing kindergarten and Grades 1-6. 5-min segments of tapings were analyzed by 4 trained judges, who used a behavior rating schedule developed for this study to categorize verbal and nonverbal behaviors. These ratings yielded the data for correlational analyses. Results indicate that the behavior rating schedule was operationally functional. Cluster analysis indicates that teacher-interns' approval tended to be passively, nonverbally expressed whereas disapproval tended to be explicitly, verbally communicated. Smiling, verbally probing teacher-interns were associated

with thoughtful and responsive pupils over a variety of verbal performance measures. (51 ref)—*Journal abstract.*

3948. Kuzma, Kay J. & Stern, Carolyn. (Loma Linda U) The effects of three preschool intervention programs on the development of autonomy in Mexican-American and Negro children. *Journal of Special Education*, 1972(Fal), Vol 6(3), 197-205.—Assigned 42 Mexican-American and 35 Negro children in 9 Head Start classes to either an autonomy, language, or control group to determine (a) the effects of a 7-wk summer program upon the development of autonomy, and (b) whether the instructional treatments produced significantly different changes in autonomy or cognitive ability as a function of ethnicity. Scores on the Cincinnati Autonomy Test Battery increased for all children, with Mexican-American children showing significant gains on 9 and Negro children on 5 of the 11 autonomy measures. Using the Peabody Picture Vocabulary Test as a measure of mental functioning, results indicate that IQ scores increased significantly ( $p < .01$ ) for children receiving either the language or autonomy curriculum.—*Journal abstract.*

3949. Lepot-Froment, Christiane & Verbeke, Ronald. (U Nationale, Zaïre) [Prediction of the efficiency of Zaïre teachers on the basis of personality tests.] (Fren) *Revue Belge de Psychologie et de Pédagogie*, 1973(Sep), Vol 35(143), 57-78.—Rated 48 male and 17 female 1st-grade teachers in Zaïre on their efficiency, measured by pupil progress. Personality tests used were Gough's California Psychological Inventory (CPI), the Thurstone Temperament Schedule, the Object Relations Technique, and the Rorschach. Though the number of variables yielded amounted to 62, which were applied to 2 criterion measures, pupils' final achievement in calculus could not be predicted. Significant negative correlations occurred between 5 CPI scales and final achievement in reading, whereas 2 areas of responses to the Rorschach showed a positive relationship to the same criterion measures. Content analysis indicated that efficient teachers tended to describe themselves on the CPI without complacency and to express their personal problems rather freely, according to the Rorschach. (42 ref)—*L. A. Ostlund.*

3950. Madden, John L. & Krislov, Joseph. (U Kentucky) A university experience with academic ombudsmen. *Educational Record*, 1974(Spr), Vol 55(2), 110-114.—Discusses the establishment of the position of ombudsman in 1970 at the University of Kentucky in an attempt to improve the relationship between students and administrators in the aftermath of 1968 student uprisings. Students, faculty, and administrators participate in selecting the ombudsman, and the position is outside the university's normal administrative structure. The influence of the ombudsman has been limited to 2 basic areas. (a) He has dealt with a few specific complaints, brought by 1-2% of the student body; these problems have chiefly involved conflicts over judgments of student performance, disagreements regarding penalties for violation of academic rules, student unhappiness with general faculty performance, and inadequately administered academic rules. (b) Existence of the position of ombudsman seems to have created a psychological climate that is conducive to the settlement

of academic conflict. Although the same problems continually recur, they appear to be problems that might not otherwise have come to the fore at all. And although the position has not yet caused any changes in rules that are under debate, an increase in the attractiveness of the position may recruit personnel who will aggressively push for radical changes.—*R. Gutzke.*

3951. Mosher, Ralph L. (Boston U) Knowledge from practice: Clinical research and development in education. *Counseling Psychologist*, 1974, Vol 4(4), 73-82.—Discusses clinical research and development (CRD) as a method which can give new insights to the educational process. A project is described in which adolescents demonstrated ability to absorb counseling skills and superior effectiveness in relating to peers with problems. Analysis through CRD involves reflection, teaching, and evaluation. (16 ref)

3952. Moskovitz, Sarah. (California State U, Northridge) Behavioral objectives: New ways to fail children? *Young Children*, 1973(Apr), Vol 28(4), 232-235.—Discusses the use of behavioral objectives in education and how well they solve classic educational problems. Dilemmas of early childhood education are discussed and alternative approaches are suggested.

3953. Panda, Kailas C. & Bartel, Nettie R. (Virginia Commonwealth U) Teacher perception of exceptional children. *Journal of Special Education*, 1972(Fal), Vol 6(3), 261-266.—Investigated the effect of specialized training and experience of teachers on their perception of exceptional children. 20 teachers with and 20 without specialized training and experience with exceptional children served as Ss. They were asked to rate 10 types of exceptionalities on 9 scales using the semantic-differential procedure. Ratings were analyzed by a 2-way analysis of variance for each factor. Significant differences in the perception between the 2 groups of teachers did not occur in any factors. There were, however, significant differences in the ratings of various concepts in all factors. Concepts labeled in terms of physical impairments were rated higher than those labeled on a sociopsychological basis. (20 ref)—*Journal abstract.*

3954. Placus, John. (Rand Corp, Santa Monica, CA) Incentives for innovation in the public schools. *Review of Educational Research*, 1974(Win), Vol 44(1), 113-144.—Formulates certain propositions about the structure and incentive systems of public schools as they relate to (a) the adoption of innovations and (b) their implementation. The general thesis is that the market structure of the public school "industry" has a major effect on the school's decision to adopt innovations, and the bureaucratic structure and incentives of schools shape in specific ways the transition from adopting innovations to implementing them. The factors that operate to maintain this structure are analyzed in detail, and many recommendations for improving the situation are offered. (4 p ref)—*P. D. Leedy.*

3955. Popkewitz, Thomas S. & Wehlage, Gary G. (U Wisconsin) Accountability: Critique and alternative perspective. *Interchange*, 1973, Vol 4(4), 48-62.—Argues against the prevailing conceptions of educational accountability which stress the application of human engineering and management theory to school problems. Schools should be accountable to several constituent

cies—the community, parents, and students. Each has a different set of interests and requirements to be satisfied. Schools are accountable to their constituencies to the extent that they involve parents and students in educational decision-making. Accountability involves developing opportunities for experiences that can be reflective, expressive, and creative for students. (90 ref)—H. E. Yunker.

3956. Posthuma, Allan B. & Carr, John E. (U London Hosp, Ontario, Canada) **Differentiation matching in school desegregation workshops.** *Journal of Applied Social Psychology*, 1974(Jan-Mar), Vol 4(1), 36-46.—Describes an attempt to test the effectiveness of matching the conceptual structure of participants in educational training and psychotherapy experiences in a school desegregation workshop designed to promote a mandatory bussing proposal by a local school board. Results indicate that differentiation matching had little effect on participants' global judgments of satisfaction with workshop goals but was significantly and inversely related to the decision to voluntarily bus a child, especially among blacks. Abstractness of topics discussed affected participant endorsement of workshop goals but did not affect bussing decision. These findings suggest that the methods of workshop organization are dependent on whether workshop success is to be evaluated on the basis of community public relations or actual decisions to bus children. (24 ref)—*Journal abstract*.

3957. Romine, Stephen. (U Colorado) **Perceptions of an effective community college instructional climate.** *Journal of Higher Education*, 1974(Jun), Vol 45(6), 415-429.—Analyzed replies to a questionnaire by 2,058 students and 325 faculty members at 29 community junior colleges in 15 states. In response to questions regarding the level of general satisfaction with the overall instructional climate of their institution, 48.1% of the students and 70.5% of the faculty reported they were satisfied or highly satisfied. The remainder were uncertain, dissatisfied, or did not respond. 70 possible attributes of an effective instructional climate were rated on a 5-point scale. Faculty mean scores were higher than student mean scores for 54 attributes. For 68 attributes the distribution of student responses was significantly different ( $p < .05$ ) from the faculty distribution. Using student responses, factor analysis resulted in 4 clusters: instructional management, student learning obligations, instructor-student interpersonal relations, and supplemental instructional provisions. An instructional climate appropriate for a community junior college is characterized on the basis of these findings.—E. L. Tatham.

3958. Simon, Roger I. & Levin, Malcolm A. (Ontario Inst for Studies in Education, Toronto, Canada) **The irrationality of rationalized program development.** *Interchange*, 1973, Vol 4(4), 63-76.—Contends that local schools should be responsible to their communities, not to provincial educational authorities, for developing to provincial environments that reflect the community's learning values, expectations, and priorities. Provincially rationalized systems conflict with the trend toward decentralization of program development to the local school level. (15 ref)

### Curriculum Development & Teaching Methods

3959. Anderson, J. Harold. (Western Carolina U) **Sex education in North Carolina.** *Western Carolina University Journal of Education*, 1974(Spr), Vol 6(1), 20-22.—Reports on a sex education questionnaire sent to 100 randomly chosen North Carolina schools, with answers received from 74. In 23% of the schools, the administration instructed teachers to give sex education as appropriate, but in 38% sex education was a planned part of the curriculum. Males were instructed in sex education more than females. The larger the school, the better the quality of sex education. In 41% of the schools, instruction was given in terms of the sexual understanding needed by the individual student. Broader sex education programs in North Carolina, making use of all community resources, are recommended.—J. Joesting.

3960. Argyros, Nicholas S. & Rusch, Reuben R. (State U New York, Albany) **Trimodal programmed instruction in reading.** *Journal of Experimental Education*, 1974(Sum), Vol 42(4), 1-5.—Evaluated the instructional effectiveness of the introductory units of the Trimodal Programmed Instruction in Reading. Ss in Grades 2-4 from a low socioeconomic area were given the Word Recognition and Functional Reading subtests of the Criterion Test before and after completing the program. Results show substantial improvement in posttest scores for all Ss.

3961. Asher, James J.; Kusudo, Jo A. & de la Torre, Rita. (California State U, San Jose) **Learning a second language through commands: The second field test.** *Modern Language Journal*, 1974(Jan), Vol 58(1-2), 24-32.—Studied the effectiveness of motor activity in foreign-language learning, using 27 undergraduates in an experimental course in Spanish. Instruction began with simple motor commands which were gradually elaborated so that nonimperative structures could be embedded within them. Later, students' commands, skits, and problem-solving situations were included. Performance was assessed after 45 hrs, and compared with that of 3 control groups: a group of high-school students with 1 yr of Spanish (C1), and 2 groups of college students, one finishing the 1st semester (C2), and one finishing the 2nd semester (C3) of Spanish. The experimental group outperformed all control groups in listening comprehension, and were equal to C2 in reading skill. The Pimsleur Spanish Proficiency Test, Form A, was administered, and the experimental group's mean performance was at the 70th percentile for listening, 85th for reading, and 76th for writing. Speech skill was "good" on a poor-fair-good scale. After 90 hrs, the Pimsleur, Form C, assessed performance at beyond the 50th percentile for all skills except listening (49th percentile). It is concluded that the program demonstrates high transfer from listening to other linguistic skills in half the time of conventional programs.—*Journal abstract*.

3962. Barlow, R. M. (U Wisconsin, Stout) **An experiment with learning contracts.** *Journal of Higher Education*, 1974(Jun), Vol 45(6), 441-449.—Used the learning contract method in a philosophical ethics course. After 4 wks of orientation, contract negotiations were held. In cooperation with the instructor, each student developed a set of objectives, identified needed resources, developed a sequence of learning activities.

and indicated the evidence of achievement and the mode of evaluation. The instructor assessed the experiment using a log of learning activities, evidence of student achievement, and student evaluations of the method. Although the instructor was originally a traditionalist and approached the experiment with misgivings, his conclusion was that the use of learning contracts has promise in philosophy and that further experiments are needed.—*E. L. Tatham.*

3963. Björk, Lars-Eric. [BASIC programming in the tenth-grade mathematics course and its effects on students' numerical ability and attitudes towards mathematics.] (Swed) *Pedagogisk-Psykologiska Problem*, 1974(Jul), No 246, 22 p.—Investigated the influence of the introduction of the programming language, BASIC, and work with flow charts, algorithms, and computers on the numerical ability of 10th graders and their attitudes towards mathematics. The mean gain on a repeated numerical test and the result on an attitude test were significantly higher for the computer group than for the comparison group. These positive effects were particularly pronounced for students with low grades in mathematics. (27 ref)—*English abstract.*

3964. Blank, Marion; Koltuv, Myron & Wood, Marilyn. (Albert Einstein Coll of Medicine, Yeshiva U) Individual teaching for disadvantaged kindergarten children: A comparison of two methods. *Journal of Special Education*, 1972(Fal), Vol 6(3), 207-219.—Assigned 44 disadvantaged kindergartners to one of 3 groups: individual teaching in a structured tutorial program, individual teaching oriented toward more traditional preschool techniques, or no supplement to the regular kindergarten program (controls). Selected mothers from the community who were trained by 2 professional teachers did all the teaching. At the completion of the tutoring, Ss in the structured tutorial program showed greater WISC IQ gains than did either of the other 2 groups, which did not differ significantly from each other. A 1-yr follow-up indicated that Ss in the specialized tutorial program maintained their relative superiority and that the gains previously found with the structured tutorial program could not be attributed simply to individual attention. Although the IQ gains in the kindergarten children were comparable to those found when the program was applied to 3- and 4-yr-olds, resistance to the learning situation was considerably more marked in the older children. (17 ref)—*Journal abstract.*

3965. Bundy, Lester L. (Regis Coll, Div of Social Sciences, Denver, CO) Our current reading instruction is inadequate. *Reading Teacher*, 1974(May), Vol 27(8), 774-777.—Contends that developments in communications media have created a need for many new skills in the language arts, which is being ignored. Teachers of reading should recognize the importance of the study of semantic content. The traditional view of reading instruction needs to be greatly expanded to include skills involved in dealing with modern communications techniques. Haney's communications anomalies can serve as a guide in teaching such skills.

3966. Collier, Calhoun C. & Redmond, Lois A. (Michigan State U) Are you teaching kids to read mathematics? *Reading Teacher*, 1974(May), Vol 27(8),

804-808.—Points out that special training is required for reading mathematics texts. The style of the writing differs from that of other reading material, and the vocabulary is not always conventional word symbols but includes mathematical symbols which must be "read" and comprehended differently from conventional word meanings.

3967. Dansereau, Donald F.; Evans, Selby H.; Atkinson, Tomme A. & Long, Gary L. (Texas Christian U, Inst for the Study of Cognitive Systems) Factors relating to the development of optimal instructional information sequences. *US AFHRL Technical Report*, 1974(Jul), No 73-51, 40 p.—Tested Inscal multidimensional scaling and found it useful in (a) defining the information complexity of technical material, (b) developing sequences of key concepts within technical material, and (c) providing an index of expert interrater consensus. When the Inscal measure was obtained after 180 college students were exposed to the material, Inscal provided an indication of the correspondence between experts' and students' understanding of concept interrelationships. Major findings are as follows: (a) Alternative sequences of instructional material influenced student performance. (b) Pictorial technical information sequences resulted in small performance differences compared to verbal print sequences. (c) Technical information difficulty debilitated student performance. (d) Student reading aptitude was significantly related to student performance under both pictorial and verbal print presentation modalities. (e) Instructional sequences did not interact with student aptitude.—*Journal abstract.*

3968. Deitz, Samuel M. & Repp, Alan C. (Georgia State U) Producing better performance in a behaviorally-taught college course by allowing earned exemptions from a final exam. *Improving Human Performance*, 1973(Win), Vol 2(4), 263-266.—Conducted an introductory course in the application of behavior analysis to human growth and development through behavioral methods for 2 quarters with 30 university students. In the 1st quarter, students could avoid taking the final examination by scoring above criterion on unit tests. Students in this quarter performed significantly better than students in the 2nd quarter who could not earn an exemption from the final.—*Journal abstract.*

3969. DeWaard, Richard J.; Jagmin, Nancy; Maisto, Stephen A. & McNamara, Patricia A. (U Wisconsin, Milwaukee) Effects of using programmed cards on learning in a museum environment. *Journal of Educational Research*, 1974(Jul-Aug), Vol 67(10), 457-460.—120 museum visitors over age 13 yrs viewed an exhibit with or without the benefit of programed cards. The presence or absence of feedback and the amount of information on a card were manipulated in a factorial design. The experimental groups were compared to control Ss who received only a test on the material, or who studied and were tested on the exhibit without benefit of the cards. Analysis of posttest scores indicated that while the experimental groups performed significantly better than both control groups, no significant differences were found among the experimental groups. The data compared to that obtained by C. G. Screven (1974) support the hypothesis that the cards directed the visitor's observing behavior.—*Journal abstract.*

3970. Dowsey, M. W. **Easy author-entry systems: A review and a prototype.** *International Journal of Man-Machine Studies*, 1974(Jul), Vol 6(4), 401-419.—Discusses the various types of easy author-entry systems that have been developed for use in computer-assisted instruction, describing the salient features of particular systems and suggesting where each type might be used. A prototype system is described whose design aims have concentrated particularly on the problems of ease of use, documentation, and standardization. (17 ref)

3971. Earp, N. Wesley. (North Texas State U) **Challenge to schools: Reading is overemphasized.** *Reading Teacher*, 1974(Mar), Vol 27(6), 562-565.—Recommends that in teaching a child who is doubtful of his capacity in reading or is unconvinced that he needs to learn to read, the teacher's motto might well be, "Cool it." Aid the child and give him opportunities to deal with his problems of ability, self-concept, social and cultural background, and basic motivation; but do so in a calm emotional climate. For such a child, reading as a set of formal tasks would thus be de-emphasized. However, reading would continue to be seen as a natural learning process for many or most people.—P. D. Leedy.

3972. Esveltdt, Karen C.; Dawson, Patrick C. & Forness, Steven R. (U California, Los Angeles) **Effect of videotape feedback on children's classroom behavior.** *Journal of Educational Research*, 1974(Jul-Aug), Vol 67(10), 453-456.—Used video feedback in a classroom setting with 3 10-yr-old boys who had exhibited disruptive behavior. With observable classroom performance as a dependent variable, comparison was made of the effects of the standard teacher conference, video feedback, and video feedback accompanied by discussion. Results indicate that viewing their own performance in the classroom provided an effect on Ss' classroom behavior quite beyond that expected from teacher discussion alone.—*Journal abstract.*

3973. Fleischer, Anne-Vibeke. [School psychology in the classroom.] (Danh) *Skolepsykologi*, 1974, Vol 11(3), 196-216.—Points out that many of the common problems mentioned by teachers and pupils belong to the classroom group as a whole, and describes workable techniques for use by the teachers supported by school psychologists or special education teachers. Role-playing, group problem-solving, and guided discussions facilitated analysis, but results will depend on adapting the program to the individual classroom.—P. Mylov.

3974. Floyd, John R. & Lumsden, D. Barry. (U Maryland) **Effects of frame size in teaching vocabulary development with programmed instruction.** *Improving Human Performance*, 1973(Win), Vol 2(4), 267-272.—Investigated the effects of differential frame sizes (i.e., 1, 3, 7, and 12 words practiced per frame) in teaching the same set of vocabulary words to 80 6th graders. Differences in the relative effectiveness of the 4 frame sizes were found. Results show that, for Ss engaged in vocabulary development, programs with a 3-word frame size led to greater learning.—*Journal abstract.*

3975. Fricklas, Robert & Rusch, Reuben. (State U New York, School of Education, Albany) **Trimodal reading instruction with inefficient learners.** *Slow Learning Child*, 1974(Mar), Vol 21(1), 44-52.—Evaluated the teaching effectiveness of Trimodal Programmed

Instruction in Reading with inefficient learners who were making limited or no progress in their elementary school reading programs despite other remedial procedures. Based on their performance on a criterion pretest, 9 2nd, 3rd, and 4th graders were assigned to either a full remedial program or a partial program. Work recognition and comprehension skills were fostered by having the pupil actively construct sentences by placing plaques associated with whole words on an interface. A policy of limited supervision and limited directive guidance was employed. Results indicate the Ss in both full and partial programs improved dramatically on work recognition and comprehension tasks when post tested.—C. L. Nicholson.

3976. Fromberg, Doris P. (Hofstra U) **British primary schools: Ideals and realities.** *Elementary School Journal*, 1974(May), Vol 74(8), 468-480.—Describes the open-school characteristics of some British elementary schools. Children and teachers are reported to be "calm, occupied and involved" in the processes of elementary education. Teacher supervision is not so continuous in British schools as in American ones. Also, the change in atmosphere and approach that takes place in American schools between kindergarten and 1st grade is postponed in the British system until children are about 8½ yrs old. The shift to "openness" in British elementary schools has reoriented the testing program; it no longer appraises a child in terms of grade- or age-norms but in terms of his own environment. Emphasis on pupil activity has developed novel ways to teach the scientific method, such as counting the number of heartbeats before and after a child runs for 2 min. The overall concept is that the teachers should assist the children in learning to learn.—A. J. Ter Keurst.

3977. Giroux, Roy F. & Pietrofesa, John J. (St Clair Coll, Windsor, Ontario, Canada) **New directions for disadvantaged adults in the community college.** *Canadian Counsellor*, 1974(Jun), Vol 8(3), 156-162.—Discusses the need for new methods of helping disadvantaged adults and youth through community colleges, and suggests that Canadian community colleges can help in the delivery of educational and service programs to disadvantaged students. A life-skills program to assist disadvantaged adults in obtaining employment opportunities is described. The need for faculty to respond to the culturally different, for a new curriculum which has been modified to their needs, and for new teaching consistent with learning styles of the alienated is discussed. Specific program guidelines are presented. (French summary) —*Journal abstract.*

3978. Groff, Patrick. (California State U, San Diego) **The topsy-turvy world of "sight" words.** *Reading Teacher*, 1974(Mar), Vol 27(6), 572-578.—Reviews the literature on sight words and their teaching in beginning reading. It is concluded that most statements made by modern writers about how children recognize sight words are wrong. However, evidence is presented in support of the opinion that "teaching each whole word as a single entity" is currently in bad repute.—P. D. Leedy.

3979. Gross, Susan ; Carr, Martha L.; Dornseif, Allan & Rouse, Sally M. (Matteson School District, IL) **Behavioral objectives in a reading skills program,**

grades 4-8. *Reading Teacher*, 1974(May), Vol 27(8), 782-789.—States 5 assumptions and outlines the following program objectives based on them: word recognition, vocabulary development, interpretive comprehension, literal comprehension, analytical comprehension, study skills, enriched reading, and composition.

1980. Hall, Vernon C. & Turner, Ralph R. (Syracuse U) **The validity of the "different language explanation" for poor scholastic performance by black students.** *Review of Educational Research*, 1974(Win), Vol 44(1), 69-81.—Contends that it would serve no useful purpose to teach English as a second language to speakers of Negro nonstandard English if the goal is to improve comprehension of standard English. The key may lie in a careful study of integration to determine the benefits gained when different cultures learn from each other. It is indicated that no research or demonstration project has yet been concerned with maximizing the values of integration. More effort should be directed toward studying universals of cognitive development rather than relatively superficial differences such as spoken dialects. (2 p ref)—P. D. Leedy.

1981. Herbert, Gwyneth F. (Metropolitan West Area Office of Education, Parramatta, NSW, Australia) **Education through music: An initial assessment of the performance of a group of 150 first grade children whose programme has included Kodaly based music training.** *Slow Learning Child*, 1974(Mar), Vol 21(1), 15-23.—Found that the 150 1st graders who had received Kodaly music training were better equipped than a comparable group who had not received the training, in the functioning areas of discrimination, closure, sequencing, and recall.

1982. Hood, Joyce. (U Iowa, Children's Reading Clinic) **Why we burned our basic sight vocabulary cards.** *Reading Teacher*, 1974(Mar), Vol 27(6), 579-582.—Warns that a good reading exercise can easily go bad if it becomes an end in itself rather than only a means to an end. Some teachers use the Basic Sight Vocabulary as though it were the end rather than the means. They find the words so important and the box of cards so convenient for practicing them that flipping through the cards becomes a major part of the remedial program. When that happens the cards had better be destroyed.—P. D. Leedy.

1983. Houston, J. G. & Pilliner, A. E. (U Edinburgh, Moray House Coll of Education, Scotland) **The effect of verbal teaching style on the attainment of educational objectives in physics.** *British Journal of Educational Psychology*, 1974(Jun), Vol 44(2), 163-174.—Observed 6 teachers in a longitudinal study of the cognitive and affective effects of different teaching styles (as identified by N. A. Flanders's 1970 interaction analysis technique) on the learning of physics by 14-16 yr old pupils following a course for the Scottish Certificate of Education. Analyses of variance and covariance revealed that the open-ended style achieved the more complex cognitive educational objectives more successfully than did either the intermediate or expository styles. On the whole, the open-ended procedure was the most successful in developing favorable attitudes towards physics. (19 ref)—*Journal abstract*.

1984. Hunter, Walter E. (Meramec Community Coll, St Louis, MO) **Self-directed learning at Meramec Community College: An alternative to traditional practice.** *Improving Human Performance*, 1972(Mar), Vol 1(1), 13-23.—Results of an experimental self-directed learning program with over 400 college students indicate that (a) many students can assume a major responsibility for their own learning; (b) costs for self-directed and traditional instruction are about the same; and (c) on the basis of course grades, Ss achieved more than students in traditional courses.

1985. Jamison, Dean; Suppes, Patrick & Wells, Stuart. (Educational Testing Service, Princeton, NJ) **The effectiveness of alternative instructional media: A survey.** *Review of Educational Research*, 1974(Win), Vol 44(1), 1-67.—Reviews research on the effectiveness of alternative instructional media: traditional classroom instruction, instructional radio, instructional TV, programmed instruction, and computer-assisted instruction. It is concluded that students learn effectively from all these media. Few studies indicate that one medium is significantly different from another. The key to productivity is not that technology should replace teachers, but that it should be used to make teachers more productive. Technology has thus far been primarily an enrichment of the individual student's experience, but it has seldom, if ever, increased system productivity. It has not yet proved that it can play an important role in American schools. (8 p ref)—P. D. Leedy.

1986. Johnson, Roosevelt & Harshman, Carl L. (Ohio State U, Office for Minority Affairs) **A black experience seminar: An appraisal of impact.** *Journal of Non-White Concerns in Personnel and Guidance*, 1974(Apr), Vol 2(3), 157-171.—Evaluates a black experience seminar that was presented as part of a concerted inservice staff development program aimed at reducing the discrepancies between educational achievements of black and white students in an Ohio school district. Results of a survey indicate that (a) 98% of the seminar participants felt that the seminar was worthwhile, (b) 64% felt that the seminar would eventually have an impact on the school system (31% were undecided), and (c) 88% felt that the materials and references distributed and cited in the seminar were helpful in understanding the dynamics of the black experience. When asked whether they had ample opportunity to express views and ask questions, 17% of the participants felt that such time was inadequate, and 5% were undecided.—M. E. Pounsel.

1987. Judd, Wilson A.; O'Neil, Harold F. & Spelt, Philip F. **Individual differences and learner control: II. Investigation of control over pictorial mediators in computer-assisted instruction.** *US AFHRL Technical Report*, 1974(Jul), No 74-30, 70 p.—Describes Phase 3 of a 3-phase investigation; Phases 1 and 2 are described in volume I (see PA, Vol 53:Issue 1). The learning task for Phase 3 was the identification of edible plants and their critical features and edible parts. Experimental hypotheses centered on the affective advantages of learner control, personality variables which influence the use of learner control, and the instructional effectiveness of pictorial mediators under learner control. 3 experimental groups were used. A Treatment Present (TP) group received a facilitating treatment (pictorial mediators). A

Treatment Absent (TA) group did not receive the treatment, and the Learner Control (LC) group had control over the availability of the treatment. In performance, there was a significant difference between the TP and TA groups, TP having the highest mean performance. This proved that the facilitating treatment was an effective learning variable to be placed under learner control. Performance of the LC group excelled that of the TA group and did not significantly differ from that of the TP group. The presumed affective advantage of learner control was not shown. Of the 2 personality measures used, Rotter's Internal-External Control Scale and the Achievement via Independence (Ai) scale of the California Psychological Inventory, only the Ai predicted individual differences in learner control behavior. The best predictor of learner control behavior and performance was a task-specific measure developed for this project.—*Journal abstract.*

3988. Judd, Wilson A.; O'Neill, Harold F. & Spelt, Philip F. (U Texas, Austin) **Individual differences and learner control: I. Program development and investigation of control over mnemonics in computer-assisted instruction.** *US AFHRL Technical Report*, 1974(Jul), No 74-3, 120 p.—Describes 2 phases of a 3-phase investigation of the effect of learner control on performance and anxiety in a computer-assisted task. Phase 1 developed a 2-hr instruction program on the identification of edible plants, run on an IBM instructional system. Phase 2 attempted to determine the effectiveness of learner control. Ss were 162 university undergraduates divided into 4 groups. Group 1, Treatment Present (TP), received a presumably facilitating treatment (mnemonic devices relating plant names to their critical features); Group 2, Treatment Absent (TA), did not. Groups 1 and 2 served as control groups. Groups 3 and 4 were given learner control over access to the mnemonics but differed as to the amount of instruction they received on the use of learner control. Comparison of TP and TA performance showed that presentation of the mnemonic devices did not have the hypothesized facilitating effect. Consequently, providing access to mnemonics via learner control did not reduce state anxiety or produce better performance than that of the TA group. Relationships between individual differences variables and learner control were complex; they indicate, however, that these variables interact significantly with learner control, given a generally facilitating treatment placed under learned control. For Phase 3, see PA, Vol 53:Issue 1.—*Journal abstract.*

3989. Kingsley, Edward H. & Stelzer, John. (HumRRO, Alexandria, VA) **A theoretical basis for individualized instruction.** *US AFHRL Technical Report*, 1974(Jul), No 74-10, 120 p.—Formulates a theoretical basis for a model of individualized instruction. The theory is semiaxiomatic in nature so that the definitions and assumptions used are stated explicitly. Set theory and symbolic logic are the conceptual tools used. The model includes theories of subject-matter structure and student-state description. These are related by an overall instructional model. A main result shows how subject-matter structure constrains student-state transitions through a subject matter. An application of the subject-matter theory is made to an existing Air Force course. A

number of open problems are given whose further investigation would help make the model a more practical instructional tool. (23 ref)—*Journal abstract.*

3990. Landry, Richard G. (U North Dakota) **A comparison of second language learners and monolinguals on divergent thinking tasks at the elementary school level.** *Modern Language Journal*, 1974(Jan), Vol 58(1-2), 10-15.—Studied the effect of foreign-language learning in the elementary school (FLES) on divergent thinking abilities. 2 pairs of FLES and non-FLES schools were matched for population, city area, and socioeconomic status. Equal numbers of male and female, FLES and non-FLES Ss were randomly selected from each pair, resulting in a sample of 64 1st graders, 80 4th graders, and 80 6th graders. None came from bilingual homes. Divergent thinking was measured by the Torrance Tests of Creative Thinking, producing 6 total scores. Analysis of variance of the results showed that, as expected, no significant differences between FLES and non-FLES Ss emerged for the 1st graders. At the 4th grade level, there was no significant difference between FLES and non-FLES groups when compared within sexes, but when the data were pooled across sex, 5 of the 6 divergent thinking measures were in favor of the FLES group. The FLES 6th graders scored significantly higher ( $p > .05$ ) than the non-FLES 6th graders on all divergent thinking measures, but again only when the data were combined across sex.—C. A. Sherrard.

3991. Landry, Richard G.; Schilson, Elizabeth & Pardew, E. Michelle. (U North Dakota) **Self concept enhancement in a preschool program.** *Journal of Experimental Education*, 1974(Sum), Vol 42(4), 39-43.—Investigated the effects of a preschool self-concept enhancement program on a group of 4-yr-old middle-class children from diverse ethnic backgrounds. Self-concept was measured by Ss' pre- and posttest scores on the Thomas Self-Concept Values Test and by teachers' reports on the Developmental Profile (H. Bessell et al). Significant increases in self-concept were found on 14 variables in the experimental group. More significant gains in self-concept were made on 5 variables by the experimental group when compared to a control group. It is concluded that self-enhancing education does increase a person's conception of self at the preschool level.—*Journal abstract.*

3992. Lefley, Harriat P. (U Miami) **Effects of a cultural heritage program on the self-concept of Miccosukee Indian children.** *Journal of Educational Research*, 1974(Jul-Aug), Vol 67(10), 462-466.—Investigated the effects of a 10-wk Indian culture program on the self-concept (SC), self-esteem (SE), and Indian self-esteem (ISE) of 20 7-14 yr old Miccosukee reservation children. The 3 variables were measured by means of the Piers-Harris Children's Self-Concept Scale, semantic differential scales, and specially developed tests of ISE. Controls, paired for sex and age, were 20 Seminoles of the same ethnolinguistic group. The Miccosukees were unchanged in global SC, but showed a highly significant rise in SE (actual-ideal-self discrepancy), in preference for Indian over Anglo stimuli, and in the posttest correlation between SC and ISE. SE change in both groups was primarily due to modification of the ideal self. Results are interpreted in terms of dissonance

theory, and their implications for self-concept testing are discussed.—*Journal abstract.*

3993. McCleskey, Joyce. (Troy State U, Reading Ctr, Fort Rucker) **Specific language training as a method of facilitating reading readiness for a select group of first grade children.** *Southern Journal of Educational Research*, 1974(Spr), Vol 8(4), 236-254.—Attempted to determine if specific experimental procedures in paradigmatic language would cause differences in reading-readiness test achievement among 58 experimental, placebo, and control 1st graders. Analysis after structure training indicated that paradigmatic language training did not significantly affect readiness test taking performance of these beginning 1st graders, nor was paradigmatic language a trainable skill at this level. These results suggest that paradigmatic language may be a developmental task in the language development domain.—*Journal abstract.*

3994. McLean, Leslie D. (Ontario Inst for Studies in Education, Toronto, Canada) **It's almost time for CAI.** *Interchange*, 1973, Vol 4(4), 35-47.—Argues that computer-assisted instruction (CAI) will soon be commonly used. Its features are those of a field undergoing development, showing all of the usual problems and inconsistencies. CAI instructional systems may eventually have responsibility for 25% of formal instruction. (34 ref)

3995. Miller, D. D. & Johnson, Gail. (U Missouri, St Louis) **What we've learned about teaching reading to Navajo Indians.** *Reading Teacher*, 1974(Mar), Vol 27(6), 550-554.—Describes teaching Navajo Indians to read as being a problem of cultural differences. Once the bicultural problem is solved and the Navajo student begins to acquire a reading vocabulary of English words, he develops a liking for reading and an increasing mastery of reading skills. Recent surveys have shown increasing Navajo interest in reading. As more English is spoken at home and as the native cultural background improves, children from the reservation are capable of mastering more quickly the technical principles involved in learning to read.—P. D. Leedy.

3996. Mueller, Theodore. (U Kentucky) **Another look at how to teach listening and reading comprehension.** *Modern Language Journal*, 1974(Jan), Vol 58(1-2), 19-23.—Presents foreign-language comprehension exercises based on a theory that comprehension involves 3 levels: sensing the gross syntactic envelope, segmenting, and recoding. Sentences are first presented with emphasized prosody and extended pauses to exaggerate the envelope. Segmentation into clauses follows, stressing within-clause syntactic patterns. Segmentation into vocabulary items is the final stage.

3997. Newman, Morris I.; Williams, Reed G. & Hiller, Jack H. **Delay of information feedback in an applied setting: Effects on initially learned and unlearned items.** *Journal of Experimental Education*, 1974(Sum), Vol 42(4), 55-59.—94 undergraduates enrolled in an educational psychology course read an assigned article of about 3,700 words. A 30-item multiple-choice test was then administered and followed by 1 of 4 treatments: no feedback, immediate feedback, 1 day delayed feedback, or 7 days delayed feedback. A retention test, consisting of the original items and distractors randomly reordered, was

administered 7 days after the feedback. No overall differences in performance were observed. Likewise, there were no significant differences for the test items analyzed according to initial performance or according to item difficulty. Questionnaire data indicated that immediate feedback stimulated the most rereading. These results raise questions as to the importance of controlling feedback intervals carefully in applied instructional settings.—*Journal abstract.*

3998. O'Day, Rory. (U Waterloo, Ontario, Canada) **Reality teaching: The self-analysis classroom.** *Interchange*, 1974, Vol 5(1), 36-45.—Suggests that classrooms should be structured in such a way that students are able to engage in direct self-analysis of their own behavior. Students should learn to distinguish between how they are behaving and how they think they are behaving. Topics discussed include the role of the teacher, the reactions of students, phases of group development, and applications of the self-analysis method. (20 ref)—H. E. Yucker.

3999. Oller, John W. & Nagato, Naoko. (U New Mexico) **The long-term effect of FLES: An experiment.** *Modern Language Journal*, 1974(Jan), Vol 58(1-2), 15-19.—Investigated the extent to which foreign language instruction in the elementary school (FLES) confers superior FL proficiency in the secondary school. 233 female FLES and non-FLES Ss were selected in paired groups from Grades 7, 9, and 11 at a Japanese secondary school. Their FL proficiency in English was tested by 3 50-item cloze tests, 1 test for each grade. IQ was controlled for. Results show a significant difference ( $p < .001$ ) between FLES and non-FLES 7th graders. In the 9th grade the difference was still significant ( $p < .025$ ), but by the 11th grade the difference was insignificant. It is concluded that since FLES and non-FLES students receive the same FL instruction from 8th grade onwards, FLES students may mark time after this point, which would allow the non-FLES students to catch up with them. The alternative conclusion is that, although FLES confers some initial advantage in secondary school, this is soon lost in the face of the ability of non-FLES students to catch up.—C. A. Sherrard.

4000. Porterfield, Denzil. (U Houston) **Influence of inquiry-discovery science preparation on questioning behavior of reading teachers.** *Reading Teacher*, 1974(Mar), Vol 27(6), 589-593.—Suggests that the types of questions recommended by authors of basic reading series be analyzed to reveal the extent to which the guide questions proposed in the teachers' manuals facilitate the teaching of thinking skills. When the questions are deficient in stimulating thought, supplementary guide questions can be developed. This would enable teachers desiring to achieve a particular cognitive or affective goal to incorporate an effective strategy of questioning into teaching which otherwise might not achieve the desired result.—P. D. Leedy.

4001. Powers, Richard B. & Edwards, K. Anthony. (Utah State U) **Performance in a self-paced course.** *Journal of Experimental Education*, 1974(Sum), Vol 42(4), 60-64.—Describes the performance of 92 students in an individually paced course in introductory psychology. Ss were required to complete 30 units of material by oral

interviews and every 3rd unit was followed by a written exam. It was found that the earlier an S started to work, the sooner he finished the course, and that more of those who started early completed the course than those who started later. Individual exam records showed that patterns of exam-taking could not be characterized by any single mode. Fixed-ratio, fixed-interval, and pacing schedule patterns of responding were obtained. Most of the Ss who withdrew from the class did so after completing 1 of the 1st 3 exams and there was no history of exam failure associated with these Ss. Early finishers had a slightly more favorable attitude toward the course than late-finishers. Among Ss who indicated a change toward majoring or minoring in psychology, the change was greater for those who finished early. A major implication of this study is that students should be reinforced for starting to work early in a self-paced class since it maximizes the probability that the student will complete the course. (16 ref)—*Journal abstract*.

4002. Ryan, Frank L. (U California, Riverdale) **The effects on social studies achievement of multiple student responding to different levels of questioning.** *Journal of Experimental Education*, 1974(Sum), Vol 42(4), 71-75.—Exposed 5th and 6th graders to high- or low-level materials (e.g., aerial photographs) and questions on geographical themes. On subsequent achievement tests, Ss responded at levels consistent with the questions posed; both groups outperformed a control group that was taught geography without the materials or questions. (19 ref)

4003. Santhanam, M. R. (Maharaja Sayajirao U Baroda, Ctr of Advanced Study in Education, India) **Some strategies of effective teacher classroom behavior.** *Indian Journal of Psychometry & Education*, 1972(Dec), Vol 3(2), 72-75.—Observed 32 randomly selected teachers from comparative and private schools for 6 hrs each, using N. A. Flanders's interaction analysis category system (see PA, Vol 44:21578), to test teacher strategies of transition from (a) short question-short answer to repeated student discussion or (b) short question-short answer to open-ended interchange. Pearson product moment correlations of  $-.17$  (not significant) were found for the (a) sequence and of  $.59$  ( $p < .01$ ) for the (b) sequence. Results suggest that a strategy of open-ended questions eliciting initiation-type responses can facilitate the creative inquiry cycle.—*J. B. Francis*.

4004. Sawyer, Diane J. (Syracuse U) **The diagnostic mystique: A point of view.** *Reading Teacher*, 1974(Mar), Vol 27(6), 555-561.—Criticizes the prevailing attitude that a skill-oriented assessment of a child's reading behavior by a reading expert is the last word in diagnostic workups and that if skill deficiencies can be specified accurately the child will progress. This approach is considered too simple. Suggested remedies are to create learning environments favorable to the attainment of concepts, motivation, and flexible cognitive strategies.—*P. D. Leedy*.

4005. Sepe, Robert. (Montclair State Coll) **An empirical evaluation of an automated cognitive-psychomotor self instruction application.** *Improving Human Performance*, 1973(Win), Vol 2(4), 273-278.—The historical growth of self-paced instructional modules often has been restricted to programing verbal skills. In the present

study 2 cognitive-psychomotor tasks (dry mounting and laminating) were programed, and a hardware delivery system, featuring an autoprogram stop and slide synchronization capability, was developed and tested with 60 undergraduate students. Data disclosed that the system can be successfully used to instruct cognitive-psychomotor tasks which formerly were instructed by teachers on a one-to-one or small group basis.—*Journal abstract*.

4006. Stendig-Lindberg, G. (Karolinska Hosp, Stockholm, Sweden) **Some comments on the sex education in Sweden and on the goals of sex education.** *Israel Annals of Psychiatry & Related Disciplines*, 1974(Jun), Vol 12(2), 107-110.—Comments on some of the current books and pamphlets used in Swedish sex education programs and on the ideal goals of sex education programs in general. The need to emphasize responsibility and the unity of sexual and emotional behaviors in sex education programs is examined.

4007. Sullivan, Joanna. (Pennsylvania State U, Capitol Campus, Middletown) **Open—traditional—what is the difference?** *Elementary School Journal*, 1974(May), Vol 74(8), 493-500.—Tested 22 pupils from an open classroom and 26 from a traditional classroom for significant differences in creative thinking, creative writing, independence in decision-making, and self-confidence in a new situation. Ss in both groups were 5th graders matched for intelligence and sociocultural backgrounds. Open-class Ss performed better in invention ( $p < .001$ ) and in fluency with words ( $p < .001$ ). No significant differences were found between the mean scores of the 2 groups on fluency of ideas and ability to predict outcomes. In creative writing, open-classroom Ss surpassed traditional classroom Ss in variety of sentence structure and in production of vivid passages, but not in usage of unusual words and originality of topics. Open-classroom Ss were also superior in all but 2 of the 8 questions in a checklist that indicated the S's independence in task performance. In interviews with undergraduates, open-classroom Ss were more flexible in responses, more spontaneous, and less self-conscious than Ss from the traditional classroom.—*A. J. Ter Keursi*.

4008. Sullivan, Joanna. (Pennsylvania State U, Middletown) **Receptive and critical reading develops at all levels.** *Reading Teacher*, 1974(May), Vol 27(8), 796-800.—Receptive reading skills are those that help the reader to recall what he reads. Critical reading should not be confined to the upper grades. It is suggested that its development should begin in the primary grades; kindergarten children should be taught how to make judgments, predictions, and comparisons among sources of information.

4009. Taylor, P. H. (U Birmingham, England) **Lecturer's perceptions of the influence of ideas on the curriculum of colleges of education.** *British Journal of Educational Psychology*, 1974(Jun), Vol 44(2), 131-139.—Using ratings by lecturers in 7 colleges of education, the degree of influence of 20 relevant ideas on the operational curriculum of the college was examined. Results suggest that progressive, child-centered ideas were very influential, and that the ideas fell into discernible groupings, each of which may influence courses of study.

4010. Thomas, Rex & Sims, John A. (Iowa State U of Science & Technology, Computation Ctr) **Effects of chance in an animal selection simulation on college students' attitudes toward simulation.** *Journal of Educational Research*, 1974(Jul-Aug), Vol 67(10), 448-452.

—Investigated the influence on student attitudes of using a random variable to simulate real world phenomena in an instructional simulation. Randomly assigned groups of college juniors ( $N = 74$ ) participated in 2 versions (one realistic and one favorably skewed) of an animal selection simulation as an integral part of a college course. Analysis revealed no significant differences between the attitudes of the 2 groups toward the simulation. However, ex post facto analysis of groups defined by "success" in the simulation revealed a highly significant difference in frustration where the results were publicly posted. Results suggest that the administration of a simulation has greater influence on student attitudes than does the random behavior of the model. —*Journal abstract.*

4011. Thompson, Gerald W. (Old Dominion U) **The effects of ability grouping upon achievement in eleventh grade American history.** *Journal of Experimental Education*, 1974(Sum), Vol 42(4), 76-79.—Tested the assumption that homogeneous ability grouping reduces the range of learning differences when compared with heterogeneous (random) grouping and that this narrowing of range aids the teaching and learning process. The assumption was not upheld; heterogeneous students showed significantly greater achievement gain in 11th-grade American history at 4 ability levels than did homogeneous students.

4012. Walker, Decker F. & Schaffarzick, Jon. (Stanford U) **Comparing curricula.** *Review of Educational Research*, 1974(Win), Vol 44(1), 83-111.—Reviews experiments since 1957 that compared the achievement of students using innovative curricula with that of students using traditional curricula. It is tentatively concluded that the new curricula are not uniformly superior to the old ones (although this may be true) but rather that different curricula are associated with different patterns of achievement. The philosophic position with respect to these findings is summarized: "Stop thinking of the curriculum as a fixed race course and begin to think of it as a tool, apparently a powerful one, for stimulating and directing the active learning capacities which are ultimately responsible for the achievement we want from schools." (2 p ref)—P. D. Leedy.

4013. Willis, Jerry. (U Guelph, Ontario, Canada) **Effects of systematic feedback and self charting on a remedial tutorial program in reading.** *Journal of Experimental Education*, 1974(Sum), Vol 42(4), 83-85.—3 elementary school children with reading problems were tutored by undergraduates. After a baseline tutoring condition Ss were given different-colored chips for correctly and incorrectly read sentences. Ss counted their chips and recorded them on a graph. This feedback and self-charting substantially increased the rate of sentences read correctly and for 2 Ss reduced the error rate. (19 ref)

4014. Woody, Robert H. (Ohio U) **Educational television programming and school health.** *Journal of School Health*, 1974(May), Vol 44(5), 246-249.—Discusses the potential role of the school health professional in

educational television programming. A framework and brief literature review on the relationship between television and human behavior is presented and suggestions for school health workers and members of the community to maximize the benefits of educational television in the school are discussed. 5 recommended courses of action are presented, each emphasizing an active participatory role by the school health worker in the design, development, and production of educational television programs.—R. J. Ambrosino.

4015. Yaney, Joseph P. (Ohio State U) **A critical review of the instructional technology mechanism of task analysis.** *Improving Human Performance*, 1974(Sum), Vol 3(2), 64-70.—Discusses task analysis as a respected part of the total instructional programming process and examines the cost-benefit and operational-cost models of task analysis. 2 reasons are proposed for the fact that people respect, but do not use, the process. The 1st is that the ability to make a nonempirical field estimate of initial and terminal behaviors is thought to be highly developed. The 2nd involves the high, often prohibitive, cost of field data gathering techniques. —*Journal abstract.*

#### Academic Learning & Adjustment & Achievement

4016. Batty, W. R. & Wankowski, J. A. (U Birmingham, England) **Admission grades, temperament and degrees of chemistry students.** Birmingham, England: University of Birmingham, 1974. 26 p.—Presents a study of the interrelationships between admission grades, the selection and consistency of academic and learning styles during the transition from secondary school to the university, and personality based on data from a sample of students in a department of chemistry in one university. Comparisons with other student groups are presented, and implications for educational planning and counseling are discussed.

4017. Bayer, Alan E.; Royer, Jeannie T. & Webb, Richard M. (American Council on Education, Office of Research, Washington, DC) **Four years after college entry.** *ACE Research Reports*, 1973(Mar), Vol 8(1), 45 p.—Presents a statistical summary of a follow-up study of 34,346 students who had been part of an American Council on Education survey of entering freshmen 4 yrs earlier. Short descriptive highlights of the results indicate that students (a) became more liberal over 4 yrs with respect to campus and social issues, (b) seemed less inclined to strive for status and financial success, and (c) tended to shift their career choices away from the harder sciences toward the social sciences and education. Analysis continues on these data which are available to educational researchers for further studies.—J. B. Francis.

4018. Bonniol, Jean-Jacques & Henry, Christine. (National Ctr for Scientific Research, U Provence, Marseille, France) **[Class organization by group level: Study of modes and certain results after one year.]** (Fren) *Cahiers de Psychologie*, 1972, Vol 15(1-2), 9-27.—Studied the effects of dividing 23 French children entering the 2nd yr of secondary school (approximates US 7th grade) into 10 high-, 8 medium-, and 5 low-ability groups in French and mathematics. Ss were compared to a control group of 23 pupils who were not grouped

according to ability and who were taught by the same teachers. For experimental Ss, assignment to ability level was based on teacher recommendations at the end of the preceding grade under generally stated criteria of scholastic achievement, aptitude test scores, rate of progress, and general impression. Groups were compared in terms of teacher communication in class (similar in mode in experimental and control groups, atypical of traditional mode) and end-of-year results in mathematics and French grammar and composition. Significant differences between experimental and control groups were not found in grades given by the teachers, amount of improvement, or scores on standardized tests. Analysis by level within the experimental group indicated that differing teacher expectations for the 3 groups may have influenced results. (English summary)—E. E. Brown.

4019. Brooks, William & Emery, Lawrence. (Nova Scotia Teachers Coll, Truro, Canada) **College dropouts: A view from two schools.** *Canadian Counsellor*, 1974(Jun), Vol 8(3), 146-151.—Mailed a questionnaire to students who withdrew from 2 academic institutions—a teachers' college and a state university—to study their reasons for leaving. The responses of the 113 Ss who returned the questionnaire were classified into 5 categories: academic, health and family, financial, school environment, and other. The most important reason for withdrawal appeared to be the students' feeling that the institution did not offer an academic experience that met their personal objectives. (French summary)—*Journal abstract*.

4020. Cusin, Prune & Piolat, Michael. [Self-evaluation of performance: Some scholastic and intellectual determinants.] (Fren) *Cahiers de Psychologie*, 1972, Vol 15(1-2), 43-57.—Conducted a study with 3 groups of male students with mental ages of 10-11 yrs from 3 educational institutions. 16 Ss were in a regular scholastic regime, 29 were in a "transition" class (4th or lowest secondary school track), and 17 were in a specialized class for pupils with poor scholastic records. Ss were asked to give both a general estimate and an analytic evaluation of their performance immediately following completion of a vocabulary task. Although it was hypothesized that pupils with poor records who had experienced repeated failures would undervalue their performance, results show that both the 4th track and the specialized classes overestimated their performance. It is suggested that the findings might have been a result of the protected atmosphere of the specialized class in which praise and encouragement is the rule and errors tend to be overlooked or de-emphasized, leading to an unrealistic concept of achievement. (English summary) (23 ref)—E. E. Brown.

4021. Di Marco, Nicholas. (U Missouri, St Louis) **Life style, learning structure, congruence and student attitudes.** *American Educational Research Journal*, 1974(Spr), Vol 11(2), 203-209.—Studied the effects of congruence of the life styles of 10 English teachers with those of 196 of their 11th-grade students. Congruence scores were computed for teachers' life styles and students' attitudes toward the teacher, classroom, and learning structure. Results suggest (a) that students' attitudes toward teachers were related somewhat to the

degree to which they shared certain values and (b) that a student's attitude toward his classroom corresponded somewhat to the degree to which the classroom conforms to his life style. (23 ref)—E. J. Mason.

4022. Feichtner, S. H. & Burstyn, J. N. (Carnegie-Mellon U) **Development of individualistic behaviors in the classroom.** *Journal of Experimental Education*, 1974(Sum), Vol 42(4), 12-17.—Identifies 4 behavior patterns exhibited by students in the classroom: an active learning pattern, a passive learning pattern, a nonparticipative pattern, and a disruptive pattern. Each behavior pattern is a result of the matching or mismatching of a student's affective and cognitive skills with the demands of the classroom environment. Each behavior pattern is characterized by 3 stages—tentative, testing, and patterned—where the student perceives the possibility of reward for a certain behavior, tests whether this reward can be produced on demand, and finally adopts a behavior pattern. It is concluded that shifts in behavior patterns are possible at each stage of development if appropriate changes are made in the classroom environment, but that each stage of each pattern has its own discrete shift and remedy.—*Journal abstract*.

4023. Gruber, Joseph J. & Kirkendall, Don R. (U Kentucky) **Relationships within and between the mental and personality domains in disadvantaged high school students.** *American Corrective Therapy Journal*, 1973(Sep), Vol 27(5), 136-140.—Tested 91 14-17 yr old students in Grades 9-11 and examined whether any differences exist in the nature of relationships between personality traits of the disadvantaged and others. It was found that both high- and low-achieving gifted students from disadvantaged environments displayed more desirable personality scores than others. A low degree of relationship among intelligence variables was also reported. (21 ref)—R. S. Albin.

4024. Hensley, Bonnie. (Stephen F. Austin State U) **The relationship of selected oral language, perceptual, demographic, and intellectual factors to the reading achievement of good, average, and poor first grade reading groups.** *Southern Journal of Educational Research*, 1974(Spr), Vol 8(4), 256-271.—Administered the Metropolitan Achievement Test, Primary I battery, to 45 1st graders. Ss were ranked as good, average, or poor readers and were given additional tests to measure the language or perceptual skill areas of auditory discrimination, auditory memory, spatial relations, eye-motor coordination, form constancy sentence length, T-units, and percentage of different words in oral discourse; socioeconomic status (SES) was also considered a variable in the study. Findings show that oral language and auditory perceptual skills did not seem to differ among groups. The role of visual perceptual tasks was substantiated to a limited degree by the investigation. Additionally, SES was not a factor capable of discriminating among good, average, and poor 1st-grade reading groups. (23 ref)—*Journal abstract*.

4025. Hurtig, Marie-Claude; Hurtig, Michel & Paillard, Monique. (U Provence, Lab de Psychologie de l'Enfant et de l'Education scolaire, France) [Children's playground activities in nursery school and in primary school: Modifications in content and concepts of play.] (Fren) *Cahiers de Psychologie*, 1972, Vol 15(3-4),

185-200.—Compared play activities of children in nursery and primary school in terms of social participation and play content. 12 boys and 12 girls were observed in upper nursery school and 5 boys and 5 girls in primary school. 6 boys and 6 girls were followed from nursery to primary school, and 20 boys and 20 girls through the 1st 3 mo of primary school. Nursery school play was characterized by greater variety, less structure, and a greater proportion of nonplay activity than primary school play (37% vs 14%). In the transition from nursery to primary school, differences in amount of structured play were more marked in girls than in boys. In semidirective interviews with 30 children, nursery children described their play without giving it a label. Primary school children would simply name the game, implying a commonly understood play culture. (English summary) —E. E. Brown.

4026. Jackson, Maxie C. & DePuydt, Diane. (Michigan State U, Coll of Urban Development) **Community service: An adjustment motif for minority students.** *Journal of Non-White Concerns in Personnel & Guidance*, 1974(Jan), Vol 2(2), 94-97.—Suggests that in addition to concern about their academic survival, minority students entering predominantly white institutions experience isolation, assimilation, and identity problems. A university-sponsored program, designed to assist in the academic and social adjustment of these students is presented, providing for linkage between students' current and background experiences, for reducing the pressures of assimilation into the campus value system by providing for positive and growth relationships with minority group members, and for promoting a positive self-concept by including students in a meaningful and needed program effort.—M. E. Pounsel.

4027. Kronick, Robert F. (U Tennessee) **Perception of organizational climate as an interactive factor between attitudes and behavior: The academic model.** *Southern Journal of Educational Research*, 1974(Spr), Vol 8(4), 280-290.—Investigated the relationship between attitudes toward learning and academic achievement. 195 junior high school students were administered a questionnaire that included the variables of organizational climate, perception of classroom climate, age, sex, race, and intelligence level; the dependent variable was academic achievement. Results indicate that in selected cases there were significant differences noted in academic behavior because of perception of the setting as "open" or "closed." There were, however, no significant differences between the achievement of males and that of females. Unlike L. G. Warner and M. De Fleur (see PA, Vol 45:4102), who placed the behavior setting as intervening with attitudes and action, it was felt that a more dynamic symmetrical bond was more likely the case with the setting being both antecedent and intervening with attitudes and actions. Thus, in the present study, there were nondemographic factors in explaining academic achievement.—M. E. Pounsel.

4028. Lachar, David. (Fafayette Clinic, Detroit, MI) **Prediction of early US Air Force freshman cadet adaptation with the MMPI.** *Journal of Counseling Psychology*, 1974, Vol 21(5), 404-408.—Tested the predictive ability of MMPI scales to identify US Air Force Academy freshmen who were "high risk" for

problems of emotional adjustment and subsequent separation from the Academy. The entrance profiles from the freshman class ( $N = 1,389$ ) were screened for pathological signs by computer and by clinical evaluation. This screening process identified a 6% subsample of the total class that was labeled "high risk" on the basis of deviant profiles. Evaluation of the 165 cadets who had separated during a 2-mo interval indicated that the rate of attrition and problems in emotional adaptation leading to separation were significantly greater in the high-risk group than in the remainder of the freshman class.—*Journal abstract.*

4029. Lambert, Nadine M. (U California, Berkeley) **Intellectual and nonintellectual predictors of high school status.** *Journal of Special Education*, 1972(Fall), Vol 6(3), 247-259.—Compared assessments of intellectual and nonintellectual behavior of 300 children in the 2nd and 5th grades with their high school status as measured by evidence of successful and unsuccessful functioning and by dimensions of high school behavior derived from a factor analysis of data available in the high school record. Results demonstrate that among the intellectual predictors, elementary school grades predicted a greater range of high school behavior than did measures of intelligence. WISC IQ scores were better indicators of high school status than group IQ scores, and reading- and arithmetic-achievement scores were the least dependable predictors. Teacher, peer, and self-ratings were equally valid predictors of high school status. Results support the need for comprehensive assessments of individual behavior at the elementary level and the planning of educational programs congruent with the affective and intellectual needs of children. (19 ref)—*Journal abstract.*

4030. Lewis, John. (Winona State Coll) **Undergraduate ability-achievement and the earning of graduate degrees.** *Educational & Psychological Measurement*, 1974(Sum), Vol 34(2), 383-385.—Investigated the relationship between membership in undergraduate ability and achievement groups and the attainment of advanced graduate and professional degrees later in life. The 874 Ss had graduated in 1948, 1954-1955, and 1959-1960. Results show that high ability and high achievement groups were most likely to obtain advanced degrees. However, a surprisingly large percentage of low-aptitude and high-achievement males completed advanced work.—*Journal abstract.*

4031. Long, Barbra H. & Henderson, Edmund H. (Goucher Coll) **Certain determinants of academic expectancies among southern and non-southern teachers.** *American Educational Research Journal*, 1974(Spr), Vol 11(2), 137-147.—Investigated academic expectancies of 120 teachers for hypothetical children entering school. Teachers rated stimulus children on the probability of learning to read in the 1st grade. Race, class, readiness test scores, activity, and attention of children were varied in a factorial design, with the latter 3 repeated measures. The teacher's background (southern or not) was a 6th independent variable. Results show significant effects for test scores, activity, and attention and 6 significant interactions. It is concluded that teacher expectancies are strongly influenced by both test scores and classroom

behavior, and that such effects may be either realistic or prejudiced. (20 ref)—*Journal abstract*.

4032. Lunemann, Alan. (U California, Berkeley) **Desegregation and achievement: A cross-sectional and semi-longitudinal look at Berkeley, California.** *Journal of Negro Education*, 1973(Fal), Vol 42(4), 439-446.—Studied the scholastic performance of all the pupils in the Berkeley schools to whom the Stanford Achievement Tests (SAT) were administered in Grades 1-3 in 1968-1970, and of those pupils known to have been in the district in 1968, on the basis of other measures, checked against their subsequent SAT scores in 1969 and 1970 in order to determine their eligibility for inclusion. In 1968 the Berkeley system went through voluntary desegregation. Results indicate that scores generally went up over the 3 yrs and pupils who remained in the district for 2 or 3 yrs did better than pupils who were tested in only 1 of those years.—*W. E. Sedlacek*.

4033. Lyons, James E. (Kentucky State U) **The adjustment of black students to predominantly white campuses.** *Journal of Negro Education*, 1973(Fal), Vol 42(4), 462-466.—Mailed a questionnaire to 140 colleges and universities in 1969. By the end of the school year in 1971, 48% had returned the questionnaire. Practically every school had a "Black/Afro-American History Week," and a "Black Art Festival" was the 2nd most popular activity. 62% placed major emphasis on political functions in their black student organizations. Although a few schools stated that 50% of the students were "militant," the average for all schools was 10%. When asked if the "militants" were in control, the respondents were evenly divided; 27 said yes and 27 said no.—*W. E. Sedlacek*.

4034. Mason, G. A. (U Waikato, Hamilton, New Zealand) **Ability grouping: An ethnographic study of a structural feature of schools.** *Australian & New Zealand Journal of Sociology*, 1974(Feb), Vol 10(1), 53-56.—Presents an ethnographic description of how children perceive their school experiences, especially with regard to ability grouping. 100 8-13 yr old children, drawn from all ability groupings, were interviewed. The ability groups established, and the apparent lack of mobility in the system, reinforced the children's concept of their ability in academic areas, principally reading. Children in low-ability groups found it hard to maintain the prestige acquired by others. The group allocation was interpreted as a sign of worth in a social system which places great value on high performance measured on academic criteria, but this allocation ignored other aspects of the individual's personal growth.—*Author summary*.

4035. McClure, Robert F. (Terrell State Hosp, TX) **Multivariate identification and prediction of university student problems.** *Journal of Experimental Education*, 1974(Sum), Vol 42(4), 44-49.—Used the Omnibus Personality Inventory, the American College Test, the Willingness to Accept Limitations Scale, and self-report questionnaires to identify personality differences between 697 college students who did or did not have emotional problems. These personality differences were then used to predict emotional problems in other students ( $n = 187$ ). Personality differences on 7 measures predicted 3 kinds of emotional problems. The

technique predicted problems with the great silent majority of students who never ask for official help. This information can be used to plan preventive counseling or educational programs early in the college career of potential problem students.—*Journal abstract*.

4036. McIntosh, Barbara M.; Wilson, Lolita N. & Lipinski, Beatrice G. (Simon Fraser U, Burnaby, British Columbia, Canada) **The extent and nature of student attrition in the first five years at Simon Fraser University.** *Canadian Counsellor*, 1974(Jun), Vol 8(3), 163-174.—Received a 29% return ( $N = 1,208$ ) of questionnaires mailed to the 4,954 undergraduates who became voluntary and administrative dropouts at a Canadian university during the 1st 5 yrs of its operation. Analysis of the responses indicate that most students left in their 1st year of studies, and did not discuss their plans with university personnel but would have liked to talk with faculty and/or administrators. Ss attributed their reasons for withdrawal almost equally to academic difficulties, personal-emotional problems, and external-environmental pressures. Two-thirds of the Ss had resumed some type of formal study. Women were significantly less likely than men to become administrative dropouts. (French summary)—*Journal abstract*.

4037. Orlando, Charles & Lynch, Jerry. (Board of Cooperative Educational Services of Alleghany County, NY) **Learning disabilities of educational casualties? Where do we go from here?** *Elementary School Journal*, 1974(May), Vol 74(8), 461-467.—Presents several sociopsychological problems of the underachieving pupil. Among these are the lock-step school organization that militates against the progress of the atypical child, and the self-fulfilling prophecy of a misinterpreted testing program. Studies by K. De Hirsch and D. G. Doehring indicate the difficulty in using tests to differentiate between slow maturation in a child and his physiological or psychological problems in learning to read. The teaching program should focus on developing the children individually rather than on how well they conform to the school pattern. The curricula of the children have 2 mutually dependent aspects. In the instructional aspect the pupil learns academic skills and in the educational aspect he learns to apply these skills in his own life and experience. The pattern of an effective inservice program of elementary education is presented. (18 ref)—*A. J. Ter Keurst*.

4038. Pandey, R. E. (East Foothill Child Guidance Clinic, Duarte, CA) **A comparative study of dropout at an integrated university: The 16 Personality Factor Test.** *Journal of Negro Education*, 1973(Fal), Vol 42(4), 447-451.—Administered the 16 Personality Factor Questionnaire to 350 entering freshmen (219 whites, 131 blacks, 193 males, 157 females) at Lincoln University in Missouri in the fall of 1969. 75% of the white students achieved "good" academic standing, 11% became dropouts, and 14% were on probation at the end of the fall semester. 74% of the black students achieved "good" academic standing, 6% dropped out, and 20% were on probation at the end of the fall semester. Analyses of variance indicated ( $p < .05$ ) that the good students were humble and submissive while the dropouts were assertive, stubborn, and independent. Both dropouts and those on probation were assertive, stubborn, and

independent. Dropouts, however, were more intelligent and of stronger superego strength than probationers. —W. E. Sedlacek.

4039. Passi, B. K. & Lalithamma, M. S. (MSU Baroda, Ctr of Advanced Study in Education, India) **Self-concept and creativity of over, normal and under-achievers amongst grade X students of Baroda.** *Indian Journal of Psychometry & Education*, 1973, Vol 4(1), 1-11. —117 10th graders in Baroda high schools, classified as over-, normal-, and under-achievers were tested for self-concept and for creativity by means of the Personality Word List, Passi Tests of Creativity, and Madhooker Patel Intelligence Test. No mean differences were found among the groups in self-concept, but over-achievers were more creative. —J. B. Francis.

4040. Seefeldt, Carol. (U Maryland) **Who should teach young children?** *Journal of Teacher Education*, 1973(Win), Vol 24(4), 308-311. —Studied 31 teachers and 329 children in an urban Head Start program in Florida. The teachers' formal education was found to be significantly related to the achievement scores of the Head Start children.

4041. Seidl, Neil W. & McKeen, Ronald L. (Coll Racine, Milwaukee, WI) **More on the use of student generated learning hierarchies.** *Improving Human Performance*, 1974(Sum), Vol 3(2), 71-80. —Selected 12 high-ability and 12 low-ability Ss from among 60 university student volunteers on the basis of high school percentile rank, grade point average, and lack of knowledge of matrix algebra. Ss constructed learning hierarchies as they learned matrix algebra. The 2 groups did not generate different learning hierarchies. However, the low-ability group required more guidance and time to construct their hierarchy. —Journal abstract.

4042. Solari, Marie-José (CNRS Lab de Psychologie Scolaire et Lab de Psychologie Associé, U Provence, France) **[Mobilization in the nursery school child: An evaluation technique: Initial data.]** (Fren) *Cahiers de Psychologie*, 1972, Vol 15(3-4), 159-169. —Rather than study attention as such, 2 aspects of mobilization, psychological tension and control of activity in writing and painting, were studied. Criteria in both activities were (a) total time spent working at the task and (b) distribution of work. In total time and in number of shifts between work and nonwork, average results for the 37 male Ss were almost identical in the 2 activities. Ss tended to spend more time working toward the early part of the 15 min allowed for each task. Pauses were longer and more frequent toward the end. Ss who spent the longest time working were also those who registered the most pauses; however, considerable intraindividual variation was noted. Teachers' ratings on characteristics associated with scholastic performance showed considerable interrelationship in the writing task but were not related to ratings of persistence in either task. (English summary) —E. E. Brown.

4043. Stambak, Mira. (CNRS, Paris, France) **[Failure at school: Is the child maladjusted—or is it the school?]** (Fren) *Cahiers de Psychologie*, 1972, Vol 15(3-4), 143-149. —Argues that, while scientific findings do not permit the affirmation that there are no genetic differences in intelligence, neither do they permit affirmation to the contrary. Findings do affirm the decisive influence

of environmental interactions of the individual. Thus, the equation "school failure = maladjusted child" is rejected at least in part. The equation "school failure = maladjustment of the school" is not rejected and calls into question the school system in relation to its objective. (English summary) —E. E. Brown.

4044. Wilcox, B. (U York, England) **The teaching of serial tasks using chaining strategies.** *British Journal of Educational Psychology*, 1974(Jun), Vol 44(2), 175-183. —Investigated the effect of chain length (short, medium, and long) and teaching strategy (backward chaining, forward chaining, and whole method) on the acquisition and retention of 2 types of chain or serial task: paper-folding (regarded as a motor assembly task) and numerical procedures. 176 female college freshmen were randomly assigned to 9 groups defined by chain length and teaching strategy in a 3 × 3 design. Within each group a motor and a number chain were taught by means of self-instructional programs, followed by practice to a criterion of 1 promptless trial. One wk later the tasks were relearned to the same criterion. No advantage was found for backward chaining in the case of the motor chains and the short and medium number chains. However, for the long number chain there was some indication that backward chaining was superior to forward chaining. Both methods were in general inferior to the whole method. (21 ref) —Journal abstract.

### Special Education

4045. Brothers, Roy J. (American Printing House for the Blind, Louisville, KY) **Arithmetic computation by the blind: A look at current achievement.** *Education of the Visually Handicapped*, 1972(Mar), Vol 4(1), 1-8. —Replicated the 1959 research by Nolan and Ashcroft which found that 75% of visually handicapped students in residential schools were below grade level in arithmetic achievement. The present investigation, which included most of the schools in the earlier study, showed that arithmetic achievement of Braille students did not improve over the decade between the 2 studies. Possible reasons for this lack of progress are considered: the caliber of students may not be what it was; there may be more programs for the visually handicapped in local schools; or other concomitant disabilities may be present among children attending residential schools. The use of manipulative devices, and grade level at which they are introduced, and their advantages and disadvantages are discussed. Once the abacus was introduced, the rate of achievement for students using it was greater than that of any group using other manipulative devices. —C. L. Nicholson.

4046. Brown, Lou et al. (U Wisconsin, Madison) **Teaching functional reading to young trainable students: Toward longitudinal objectives.** *Journal of Special Education*, 1972(Fal), Vol 6(3), 237-246. —Taught 2 5-yr-old Mongoloid students to read functionally 12 nouns and 12 adjective-noun phrases. A "whole word method" was employed. After 50 hrs of instruction, results show that Ss had already progressed beyond the reading level expected of many older Mongoloid students. The program presented here, as well as others cited, draws attention to the need for longitudinal instructional

programs for trainable-level retarded students.—*Journal abstract.*

4047. Erber, Norman P. & Zeiser, M. Lynn. (Central Inst for the Deaf, St Louis, MO) **Classroom observation under conditions of simulated profound deafness.** *Volta Review*, 1974(Sep), Vol 76(6), 352-360.—Reports the impressions of 2 professionals who wore earphones with a loud masking noise to prevent hearing. They visited classrooms for the deaf, receiving the same kinds of visual and vibrotactile speech stimuli available to the students. With such limited sensory input, they noticed that optical conditions in classrooms were not optimal for speechreading, and that background noises were distracting when perceived through the vibrator. It is suggested that special classroom communication strategies could partially compensate for these difficulties. Observations of this sort may benefit teachers and audiologists who deal with profoundly deaf children.—*W. A. Hass.*

4048. Forness, Steven R. & MacMillan, Donald L. (U California, Los Angeles) **Reinforcement overkill: Implications for education of the retarded.** *Journal of Special Education*, 1972(Fal), Vol 6(3), 221-230.—Research evidence on the motivation of mentally retarded persons seems to indicate the considerable potency of social reinforcement in the form of adult attention and approval. The use of token economy systems in classes for retarded children appears to be a form of overkill in that checkmarks, tokens, and back-up reinforcers are largely unnecessary when all that is needed is a more systematic form of social reinforcement from the teacher. Social praise and approval, moreover, represent more "natural" consequences for appropriate behavior than tokens or checkmarks. It is noted that teachers may often unintentionally ignore or misuse social-reinforcement techniques to the particular disadvantage of the retarded child. A burgeoning research effort in the area of social-reinforcement approaches to classroom management and motivation has demonstrated the effectiveness of systematic teacher attention and approval.—*Journal abstract.*

4049. Forness, Steven R. (U California, Los Angeles) **Implications of recent trends in educational labeling.** *Journal of Learning Disabilities*, 1974(Aug-Sep), Vol 7(7), 445-449.—Notes that special education has entered a new era of noncategorical approaches toward exceptional children. Beginning with disenchantment with special classes, the trend continues with serious questioning of traditional diagnostic labels and with experimentation in grouping various types of exceptional children together for educational programs. Implications of these events for learning disabled children are explored. (16 ref)—*Journal abstract.*

4050. Gray, Burl B. (Behavioral Sciences Inst, Carmel, CA) **A field study on programmed articulation therapy.** *Language, Speech & Hearing Services in Schools*, 1974(Jul), Vol 5(3), 119-131.—Describes the use by 176 clinicians of a programed articulation therapy in 9 public schools and a university clinic. The observed therapeutic effects were comparable to those reported from the laboratory.

4051. Iida, Sadao. (Yamanashi U, Kofu City, Japan) **[A study of the effects of a resource-room service program for mentally retarded children and slow**

**learners.]** (Japn) *Japanese Journal of Special Education*, 1974(Mar), Vol 11(3), 62-75.—Compared 9 retarded 1st graders in a resource-room program with 10 similar children in regular classes. After a year of the program the experimental group showed a greater increase in IQ and greater progress in Japanese than the control group, and 2 experimental Ss attained the normal achievement level. (English summary)

4052. Ivey, Lillian P. & Teel, Jerry R. (Central State U, School of Education, Edmond) **Tri-sensory language stimulation with the TAVF unit.** *American Annals of the Deaf*, 1974(Jun), Vol 119(3), 318-320.—Describes the use of a teaching device, The Tactile Auditory Visual Feedback Unit (TAVF) with 15 preschool, hearing-impaired children 3-7 yrs old. Of 6 dependent variables associated with language, 5 were statistically significant. The TAVF appears to be an effective tool to use with hearing-impaired children.

4053. Keller, James F. & Moore, Marian B. (Virginia Polytechnic Inst) **Democracy in the hearing impaired classroom.** *American Annals of the Deaf*, 1974(Jun), Vol 119(3), 307-313.—Reports the application of a democratic theoretical model in a classroom for the hearing-impaired. Results show that teachers gained confidence and experienced fewer conflicts. The children began assuming more responsibility for themselves and their classmates and began to use more spontaneous language.

4054. Koegel, Robert L. & Schreibman, Laura. (U California, Santa Barbara) **The role of stimulus variables in teaching autistic children.** In O. I. Lovaas & B. D. Bucher (Eds), *Perspectives in behavior modification with deviant children*. Englewood Cliffs, NJ: Prentice-Hall, 1974. xiii, 562 p.—Reviews the literature which suggests that transfers or shifts in stimulus control do not always take place in the reinforcement techniques involved in establishing new behaviors. Characteristics of the stimulus and of the learner are discussed, and evidence is provided that the probability of a particular stimulus coming to control a response depends on the context in which it appears.

4055. Kokaska, Charles. (California State U, Long Beach) **Normalization: Implications for teachers of the retarded.** *Mental Retardation*, 1974(Aug), Vol 12(4), 49-51.—Identifies 3 major implications for teachers' functions which can be drawn from the principle of normalization. They involve the use of risk components within instruction, recognition of the transience of the teacher-learner situation, and modification of attitudes toward the retarded's participation in society.

4056. Kristiansen, Birte B. & Kristiansen, Holger. **[Integration related to the course of development.]** (Danish) *Skolepsykologi*, 1974, Vol 11(3), 183-195.—Describes 6 cases from a residential treatment center for children of elementary school age. Conclusions are drawn regarding the need to separate emotionally disabled children from local schools and from their families. It is not a question of segregation but of how to integrate them based on or supported by daytime therapy. Social and mental aftercare treatment may be supplemented by special education in the local comprehensive school.—*P. Mylov.*

4057. Marshall, Margaret. **The effect of special educational treatment of maladjusted pupils in a day**

**school.** *Association of Educational Psychologists Journal & News Letter*, 1971(Fal), Vol 2(10), 23-25.—Evaluated the progress of 60 pupils who had received part of their education in a day school for maladjusted children. The total population of ex-pupils numbered 75, and for these 60 full records were available regarding their subsequent school and work attainment. 80% had attended normal schools, and of those who left school, 75% had held 1 job for at least a year. Of the 12 Ss interviewed personally, all felt that the special school had helped them in some way, or that they had enjoyed that particular educational experience more than any other.—*I. L. Zimmerman.*

4058. **McLeod, J.** (U Saskatchewan, Saskatoon, Canada) **Problems of diagnosis and placement of the severely sub-normal child.** *Association of Educational Psychologists Journal & News Letter*, 1971(Fal), Vol 2(10), 10-17.—Suggests models relating to the diagnosis and placement of the severely subnormal child, here seen as one whose IQ would generally be expected to be below 50, but who would in all likelihood be attending day training centers. The basic placement of the child is a function of several factors, foremost being the educability of the child and his social and emotional adjustment. Once placed, educational diagnosis and treatment must be continuous and interlocking; and this means that services must be provided within the school itself and that teachers must be trained to become full team members in the diagnostic and placement process.—*I. L. Zimmerman.*

4059. **Meyers, Elizabeth S.; Ball, Helen H. & Crutchfield, Marjorie.** (Manhattan Beach City School District, CA) **Specific suggestions for the kindergarten teacher and the advanced child.** *Gifted Child Quarterly*, 1974(Spr), Vol 18(1), 25-30.—Warns that a kindergarten showing advanced development in one area should not be accelerated to 1st grade unless it is certain that he is equally mature in other areas. A child remaining in kindergarten because he is not physically or emotionally ready for the next level, but having capacity beyond his peers in some respects, must be given day-to-day challenges in his special skill. A number of suggestions for resources and activities are offered.

4060. **Minskoff, Esther H.** (Groves School, Hopkins, MN) **Remediating auditory-verbal learning disabilities: The role of questions in teacher-pupil interaction.** *Journal of Learning Disabilities*, 1974(Aug-Sep), Vol 7(7), 406-413.—Considers 2 aspects in the teacher-pupil verbal interaction for remediating learning disabilities in auditory and verbal areas: (a) the child's retrieval of the response in terms of recognition or recall and (b) the nature of the psychological process used by the child to respond to a question in terms of cognitive memory, convergent and divergent thinking, and evaluative thinking operations. Methods are discussed for constructing questions on the basis of these 2 aspects for children with auditory disabilities in auditory reception, verbal expression, auditory sequential memory, thinking operations, and reading comprehension difficulties. Implications for publication of teaching materials, teacher training, and research related to auditory and verbal learning disabilities and the teacher-pupil verbal interaction are explored.—*Journal abstract.*

4061. **Nielsen, Flemming.** [The institutionalized child: Possibilities of integration.] (Danish) *Skolepsykiologi*, 1974, Vol 11(3), 230-236.—Describes the Geelsgaard boarding school, a special residential treatment center for physically handicapped children and youth. Although the teaching covers the comprehensive school curriculum, the organization and aids are different. The aim of the 61 interns and 81 externs is integration based on individual criteria for each child.—*P. Mylov.*

4062. **Ogawa, Yoshihiro.** (Tokyo Metropolitan Kita Ryoiku Hosp for Cerebral Palsied Children, Japan) [An investigation of cerebral palsied children at the regular schools.] (Japn) *Japanese Journal of Special Education*, 1974(Mar), Vol 11(3), 85-93.—Presents results of a questionnaire survey of the parents and teachers of 61 cerebral-palsied children enrolled in regular schools. Most of the children were spastic and mildly handicapped. 34% were mentally retarded; mean IQ was 99. 53% had been accepted only reluctantly by the regular schools, and 58% were admitted only under special conditions regardless of whether they were severely or mildly handicapped. While Ss were independent in self-care functions, they had difficulty in ambulation and writing. 89% of the parents were satisfied with their children's school life, especially with their psychological growth. 59% of the teachers had felt it a burden to pay special attention to these children to prevent accidents. The level of school performance was not related to the ability to walk, but was affected by motor disability of upper extremities, speech defects, and other neurological disorders. Most teachers felt that the presence of the handicapped had a good influence on the normal children, and that the cerebral palsied with IQs above 90 should be enrolled in regular schools. Only those with IQs below 90 need special education. (English summary) —*S. Ohwaki.*

4063. **Rudel, Rita G.; Denckla, Martha B. & Spalten, Elinor.** (Columbia U, Coll of Physicians & Surgeons) **The functional asymmetry of Braille letter learning in normal, sighted children.** *Neurology*, 1974(Aug), Vol 24(8), 733-738.—Taught 40 male and 40 female right-handed 2nd, 4th, 6th, and 8th graders to read 12 braille letters by palpation, using a paired-associates method. 40 Ss learned 6 letters with their left hand and then 6 other letters with their right; the left-right order was reversed for the remaining 40. Although language was involved, this tactile-verbal paired-associate learning ultimately was better accomplished by the left hand. Results are discussed in terms of other demonstrations that (a) the left hand may be superior to the right on spatial tasks that exclude vision, (b) females develop more slowly in the performance of left-sided (right-hemisphere-dependent) tasks, and (c) females depend more than males on left-hemisphere mediation. (39 ref)—*Journal abstract.*

4064. **Shaw, Otto L.** **Youth in crisis: A radical approach to delinquency.** New York, NY: Hart, 1974. 135 p. \$7.50(cloth), \$3.95(paper).—Describes the history, conceptual basis, administration, staff functions, and goals of the Red Hill School for delinquents in England. The school's founder, Otto Shaw, who was greatly influenced by the work of A. S. Neill, has based rehabilitation on the principle of understanding and respect, instead of punishment, for the young offender.

4065. Silverman, Martin A. & Wolfson, Eva. (Child Development Ctr, New York, NY) **The use of small educational-therapeutic groups in a program for disadvantaged preschoolers.** *Psychosocial Process*, 1970, Vol 1(2), 47-59.—Summarizes results of a day care center program designed to improve the cognitive functioning of disadvantaged children. The 3-6 yr olds entering the program came from families living at minimal subsistence level and displayed deficiencies in language development, fund of information, concept development, self-esteem, initiative, and frustration tolerance. To facilitate learning it was necessary to divide class time between measures to facilitate cognitive development and therapeutic measures to counteract characterological disturbances that interfered with the children's capacity to utilize the program. The earliest gains of the program involved confidence, motivation to learn, ability to take initiative, and peer relations. During the 2nd yr participants stood out as intellectually alert and inquisitive, but with little change in their characterological problems. Both of the 1st 2 groups graduated from the program maintained their gains after they had completed grades 1 and 2.—J. M. Kleinman.

4066. Tinsley, Tuck. (Florida School for the Blind, St Augustine) **The use of origami in the mathematics education of visually impaired students.** *Education of the Visually Handicapped*, 1972(Mar), Vol 4(1), 8-11.—Describes the use of origami (paper folding) in teaching geometric concepts to the visually handicapped. Braille paper was preferred for origami rather than other types of paper. Several exercises of demonstrating geometric concepts are presented with brief discussions of the teaching methods used.

4067. Torrance, E. Paul. (U Georgia) **Interscholastic brainstorming and creative problem solving competition for the creatively gifted.** *Gifted Child Quarterly*, 1974(Spr), Vol 18(1), 3-7.—Advocates creative brainstorming contests between school teams as a way of linking creativity to competitive practices. Teams from all grade levels could compete, and disadvantaged children would not be handicapped by their cultural differences. They might actually perform better than gifted children; this occurred in a creativity contest at a university summer school for the gifted. 2-member teams of disadvantaged children scored significantly higher in creativity, both as to number and originality of ideas produced, than teams of gifted advantaged children. Observers noted important qualitative differences coming from the 2 groups. It is concluded that interscholastic brainstorming competitions can be useful in a variety of ways.—J. C. Gowan.

4068. Wilson, Harriet M. & Holbrook, Anthony. **An instrumental approach to oral-nasal speech balance with a preschool hearing impaired child.** *Volta Review*, 1974(Sep), Vol 76(6), 361-367.—Arranged a visual feedback device, Florida II, to assist in the development of oral vs nasal speech sound production. A 4-yr-old girl with severe hearing impairment and nasal speech was taught that a red light indicated hypernasality but a white light indicated oral sound and led to a reward in the form of candy. In 5 mo of training she learned to produce open vowels without excessive nasality. Vari-

tions in procedure and their application are mentioned.—W. A. Hass.

4069. Wright, Lloyd S. (U Arizona) **Perceptual characteristics of third grade conduct problem boys.** *Slow Learning Child*, 1974(Mar), Vol 21(1), 53-61.—Attempted to determine the incidence of deficits in auditory discrimination, visual motor pattern memory, and visual spatial pattern memory among 3rd grade boys with conduct problems. A learning theory evaluation suggests that problem behavior in middle-class boys may be primarily learned inappropriate behavior, while in working-class boys such behavior may be complicated by perceptual deficits. The large number of perceptual problems in the working-class Ss indicates that teachers of such children should be familiar with remedial techniques for alleviating perceptual deficits.—C. L. Nicholson.

4070. Yoshino, Kimiyoshi. (Tokyo U of Education, Japan) **[An evaluation of regular preschool education for hearing-handicapped children.]** (Japn) *Japanese Journal of Special Education*, 1974(Mar), Vol 11(3), 48-61.—Studied 7 children with severe hearing handicaps who were enrolled in kindergarten or nursery school and were receiving hearing therapy. Teachers' ratings and intelligence and achievement tests were used for evaluation. The group experience facilitated general behavior development, especially language skills. Ss' ability in abstraction was at the level of normal children and was significantly higher than that of children in schools for the deaf. Although Ss took active part in all school activities, their reading ability was 1-1.5 yrs behind that of normal children. Teachers reported difficulty in providing special instruction and attention for these children; it was almost impossible to compensate for the time lost from regular classes while they attended special classes for the hard of hearing. (English summary)—S. Ohwaki.

### Counseling & Measurement

4071. Andrey, Bernard. (U des Sciences Sociales de Grenoble, Inst de Psychologie, France) **[Psychology in the schools: Interpersonal relationships in the institution.]** (Fren) *Cahiers de Psychologie*, 1972, Vol 15(3 4), 151-157.—Outlines the mediational role of the school psychologist in the interpersonal relationships involving the child in interaction with his various environments—a role extending to the intrainstitutional relationships of school and civil personnel. School psychologists are thus in a position to contribute to changes in perspective and modifications of the institution. The adequacy of current training provided to prepare school psychologists for this professional and administrative function is questioned. (English summary)—E. E. Brown.

4072. Baldwin, Bruce A. & Wilson, Robert R. (U North Carolina, Student Health Services, Mental Health Div) **Peer services in human sexuality health education.** *Crisis Intervention*, 1974, Vol 5(3), 12-26.—Discusses the problems of development, staff selection and training, and the operation of a university-based information and counseling service on human sexuality. Data are presented showing the categories of calls over a 2-yr period.

4073. Benenson, Thea F. (Bronx Community Coll, City U New York) **Prediction of first-grade reading**

**achievement: Criterion validation of a measure of visual recognition memory.** *Educational & Psychological Measurement*, 1974(Sum), Vol 34(2), 423-427.—Conducted a longitudinal study of 192 1st-graders which examined the predictive efficiency of a newly developed measure of visual recognition memory in predicting 1st-grade reading achievement when analyzed in conjunction with a standardized conventional reading readiness test. Results of extensive regression analyses failed to substantiate any practical predictive utility for the instrument when used with a fairly homogeneous sample.—*Journal abstract*.

4074. **Bonniol, Jean-Jacques; Caverni, Jean-Paul & Noizet, Georges.** (National Ctr for Scientific Research, U Provence, Marseille, France) [Scholastic status of pupils as a determinant of marks assigned on a specific task.] (Fren) *Cahiers de Psychologie*, 1972, Vol 15(1-2), 83-92.—Studied the scholastic status of pupils as it influences the frame of reference and level of teacher expectation when pupil assignments are graded. A series of student compositions was marked by 2 groups of examiners. Group 1 was told that the papers were written by high-level 6th grade pupils, and Group 2 was told that the papers were by low-level pupils. An analysis of variance indicated that papers attributed to low-level pupils were underestimated, and those attributed to high-level pupils were overestimated. Further, results were the same with papers actually written by pupils and those artificially composed to display stated combinations of errors and inadequacies. Student teachers were found to mark higher than experienced teachers, but no significant interaction with the other experimental factors appeared. Test results suggest that experienced teachers do not escape the influence of the label of scholastic status.—*Journal abstract*.

4075. **Brod, Pearl & Brod, Nathan.** (State University Agriculture & Technical Coll, New York, Farmingdale) **Placement counseling: Focus on the community college.** *Journal of Employment Counseling*, 1974(Mar), Vol 11(1), 32-37.—Argues that, because of the vocational emphasis in the 2-yr college, placement is even more important here than in other institutions. Despite the employment needs, placement services have not been adequately developed. Counseling needs in the 2-yr colleges are varied and complex and include career counseling, follow-up, developing opportunities for minorities, and concern with the handicapped, veterans, and marginal students. Community awareness and participation is essential. To accomplish this, an adequate, well-prepared staff is required. (16 ref)—*Journal abstract*.

4076. **Cegelka, Patricia T.; Omvig, Clayton & Larimore, David L.** (U Kentucky, Coll of Education) **Effects of aptitude and sex on vocational interests.** *Measurement & Evaluation in Guidance*, 1974(Jul), Vol 7(2), 106-111.—Determined the extent to which vocational interests of adolescents differed as a function of sex and aptitude and whether the effect of aptitude on interests was the same for males and females. A 2-factor multivariate analysis of variance design was used. Ss were 263 9th graders who were measured on the 24 scales of the Ohio Vocational Interest Survey (OVIS), which served as the dependent measure. Significant differences

between males and females were found on 19 of the 24 OVIS interest scales and were fairly typical of male-female role expectations. Ss were assigned to 4 aptitude levels based on the Differential Aptitude Test. Aptitude was significantly related to 6 vocational interests areas. Ss who were low in aptitude were high in the interest areas of manual work, machine work, personal services, inspecting and testing, crafts, and precise operations. There was no interaction between sex and aptitude. Differences between males and females in vocational interests did not change at different aptitude levels. (24 ref)—*Journal abstract*.

4077. **Chitalekhya, Kumari; Sharma, S. N. & Singh, R. P.** (Patna U, Faculty of Education, India) **Development of an inventory to measure academic motivation.** *Indian Journal of Psychometry & Education*, 1973, Vol 4(1), 19-22.—Developed an inventory in Hindi and took measures of item selection, item analysis, reliability, and validity. A correlation of .54 with students' examination marks in academic subjects was achieved.

4078. **Chovan, William L.** (Western Carolina U) **Public policy and ethical considerations of testing in the schools.** *Western Carolina University Journal of Education*, 1974(Spr), Vol 6(1), 5-10.—Examines court decisions and public reactions concerning the use of tests by psychologists in the public schools. The courts have given parents the right to inspect school records. There is a description of how appropriate testing benefits students by helping to identify the conditions under which each child can learn most effectively.

4079. **Cochrane, R. G.; Schonell, Fred & Schonell, Eleanor.** (U Queensland, Educational Research Ctr, St Lucia, Australia) **The effect of context on word recognition.** *Slow Learning Child*, 1974(Mar), Vol 21(1), 38-43.—Compared student scores on the St. Lucia Graded Word Reading scores, and Words in Context; scores from the latter were significantly higher, and context improved word recognition regardless of which test was given first. Bright students showed no significant differences between scores on the 2 tests.

4080. **Crabtree, Paul D. & Hales, Loyde W.** (Minford High School, OH) **Holland's hexagonal model applied to rural youth.** *Vocational Guidance Quarterly*, 1974(Mar), Vol 22(3), 218-223.—Tested the hexagonal model of occupational classification on a population other than college students. 1,431 high school seniors from rural districts were tested with the Vocational Preference Inventory. The hexagonal configurations obtained in this study validate the hexagonal model. Possible uses of this inventory at the high school level are discussed. These include use as an efficient and economical method of classifying occupational information and to help familiarize students with occupational information.—R. S. Albin.

4081. **Crystal, John C. & Bolles, Richard N.** (Crystal Management Services, McLean, VA) **Where do I go from here with my life?** New York, NY: Seabury Press, 1974. xvii, 253 p. \$7.95.—Presents a life-work planning manual for students, instructors, counselors, and career seekers, including detailed discussion of such topics as skills-identification, educational background and self-assessment, geographical preferences and philosophy of life,

job specifications and job hunting, interviewing, and professional development.

4082. Curtis, David W. (Red River Community Coll, Winnipeg, Manitoba, Canada) **Counseling in a Manitoba community college.** *Canadian Counsellor*, 1974(Jun), Vol 8(3), 152-155.—Examines the "training" philosophy of the community college, the historical antecedents of this philosophy, and the implications for the community college student and student personnel worker. The role of the college counselor or as a guidance worker is also discussed. (French summary)

4083. Dalton, Starrette. (Indiana U) **Predictive validity of high school rank and SAT scores for minority students.** *Educational & Psychological Measurement*, 1974(Sum), Vol 34(2), 367-370.—Compared the predictive validities of the Scholastic Aptitude Test (SAT) and high school achievement for a sample of minority students, with typical predictor variable truncations absent. Results confirm that high school achievement is a less effective predictor of academic success for minority students than for nonminority students; however, it appeared to be a better predictor than the SAT. This is contrary to previous findings for minority students. The combination of predictors was superior to high school achievement alone as a predictor for both "overachievers" and "underachievers."—*Journal abstract.*

4084. Duari, P. (Inst of Education for Women, Calcutta, India) **A new scaling method for modifying ranks of candidates in public examinations.** *Indian Journal of Psychometry & Education*, 1972(Dec), Vol 3(2), 78-83.—Describes a method of transforming obtained scores on board and university examinations to overcome problems of comparisons among students based upon substantially different test items. The method uses  $d$  scores, defined as the ratio of the allotted score to the highest score on a given item or test. The method was used to transform scores of 25 students on a 10-question test. Spearman rank-difference correlations between the original scores and the  $d$  scores was .80, suggesting that  $d$  scores afford better representation of the relative performance of students in these examinations.—*J. B. Francis.*

4085. Ewing, Thomas N. (U Illinois) **Racial similarity of client and counselor and client satisfaction with counseling.** *Journal of Counseling Psychology*, 1974, Vol 21(5), 446-449.—Client evaluations of a precollege counseling interview were obtained for 13 black and 13 white students counseled by 3 experienced black counselors and 8 experienced white counselors. Black students tended to react more favorably to black and to white counselors than did white students. In general, racial similarity of client and counselor was not an important factor in these counseling interviews. The hypothesis that counselors are differentially effective in counseling students of a different racial background than their own lacks support.—*Journal abstract.*

4086. Gallo, Joseph G. (Canada Manpower, Manpower Planning and Management Development, Calgary, Alberta) **Computer-assisted vocational counseling.** *Canadian Counsellor*, 1974(Jun), Vol 8(3), 185-193.—A random sample of 6 males and 6 females from each of Grades 10, 11, and 12 ( $N = 36$ ) used the Computer-Assisted Vocational Counseling System (CAVCS). Each

student had 4, 25-min terminal sessions over a 13-wk period. Using the criterion of usage as evidenced in the number of jobs examined, an analysis of covariance with IQ score as covariate indicated that there were no significant differences in system usage across grade levels or between sexes within grade levels. Kruskal-Wallis analysis of variance testing did not reveal any significant differences in the amount of usage of the 2 modes of operation available. Evidence was found to indicate that a system such as the CAVCS could be of benefit to senior high school students during their preliminary efforts in vocational or career exploration. (French summary) (23 ref)—*Journal abstract.*

4087. Garling, P. & Jarbol, John. [The observation school in the county of Vejle.] (Danish) *Skolepsykologi*, 1974, Vol 11(3), 217-229.—Describes the school and reports a tentative follow-up study of 54 pupils conducted in 1973. The school receives up to 24 boys and girls, chronological age 6-12, for teaching and treatment after referral from a school psychologist in the county. Results of the questionnaire favored continuation of the school program and broadening the social work with families.—*P. Mylov.*

4088. Gilly, Michel; Poitou, Régine; Volle, Claude & Volle, Michel. (CNRS Lab de Psychologie Scolaire et Lab de Psychologie Associé, U Provence, France) [From nursery school to first grade: Some data and comments about predictive techniques for learning to read.] (Fren) *Cahiers de Psychologie*, 1972, Vol 15(3-4), 171-183.—Conducted a validity study of an 8-test battery designed to predict learning to read. 100 6-yr-olds were tested late in nursery school and again 1 yr later in primary school. 5 factors accounted for 76% of the variance, the 2 main factors being Scholastic Efficiency and Application (sacrifice of speed to accuracy). Results caution against the use of the test for prediction of individual accomplishment and differential assignment, but suggest that they may be useful as descriptive aids in foreseeing conditions each pupil needs for best achievement in reading. (English summary)—*E. E. Brown.*

4089. Goldstein, H. & Fogelman, K. (National Children's Bureau, London, England) **Age standardization and seasonal effects in mental testing.** *British Journal of Educational Psychology*, 1974(Jun), Vol 44(2), 109-115.—There are 2 distinct types of age standardizations for tests of school attainment. One allows for differences in age between children tested at the same time, and the other allows for average changes in test scores with time of year. Standardization procedures do not normally take this distinction into account. Analysis of data from a previous study of over 13,000 11-yr-olds showed that there was no increase in attainment scores between April and July in the last year of primary school. This "seasonal" effect creates further difficulties in providing satisfactory age standardizations. It is suggested that full age-time standardizations should be carried out by selecting standardization samples over whole age ranges at different times of year.—*Journal abstract.*

4090. Gross, Alan L.; Faggen, Jane & McCarthy, Karen. (City U New York) **The differential predictability of the college performance of males and females.** *Educational & Psychological Measurement*, 1974(Sum).

Vol 34(2), 363-365.—Performed separate multiple regression analyses in 10 undergraduate colleges of the City of New York University, using college freshman grade point average as the dependent variable and 6 high school scores as predictor variables. The multiple correlation coefficients, derived on the cross-validation samples, substantially reinforced previously reported findings that females are more predictable than males in academic settings.

4091. Hakstian, A. R. & Cattell, R. B. (U British Columbia, Vancouver, Canada) **The checking of primary ability structure on a broader basis of performances.** *British Journal of Educational Psychology*, 1974(Jun), Vol 44(2), 140-154.—Administered a battery of 57 ability tests (e.g., the Kit of Reference Tests for Cognitive Factors) to a total of 343 15-55 yr old Ss in high school, vocational training school, college, and the military. The aims were to confirm the differentiability of the better-known primary mental abilities and to assess the differentiability of the more recently hypothesized abilities, along with their relationships with the better-established constructs. A common-factor analysis of the 57 variables revealed 19 correlated primary abilities, ranging from such established factors as Verbal and Numerical Ability to less well-understood primaries in the memory and fluency-originality areas. The conceptual nature of the factors and their interrelationships are discussed, and the results are placed in the context of earlier research on abilities. (39 ref)—*Journal abstract.*

4092. Holowinsky, Ivan Z. & Pascale, Pietro J. (Rutgers State U) **Performance on selected WISC subtests of subjects referred for psychological evaluation because of educational difficulties.** *Journal of Special Education*, 1972(Fal), Vol 6(3), 231-235.—Investigated race and sex differences in the WISC performance of 50 male and 27 female black children and 39 male and 18 female white children referred for psychological evaluation. Ss had a mean IQ of 79.55, a standard deviation of 12.52, and an IQ range of 57-129. Significant race differences occurred on only the Vocabulary subtest, with white children performing better than black children ( $p < .01$ ). Boys performed significantly better than girls on the Picture Completion, Information, Vocabulary, and Block Design subtests ( $p < .05$ ). The smallest  $F$  ratio for race differences occurred on the Block Design subtest. Ss performed better on the Picture Completion subtest than on any other subtest. Findings do not support the hypothesis of racial differences in intelligence.—*L. Gorsey.*

4093. Hunt, J. McVicker & Kirk, Girvin E. (U Illinois) **Criterion-referenced tests of school readiness: A paradigm with illustrations.** *Genetic Psychology Monographs*, 1974(Aug), Vol 90(1), 143-182.—Discusses the need for tests of specific units of information, information-processing strategies, motivation, and values that demonstrate a readiness for school or that are needed to plan individualized instruction programs for children from varied backgrounds. The inappropriateness of norm-referenced tests for these purposes is discussed, and the concept of criterion-referenced tests is extended from specific learning/teaching goals to include the general area of school readiness. A paradigm for such criterion-referenced tests is presented, and descriptions of tests of

semantic mastery of color, position, shape, and number concepts are included. Illustrative data from comparative studies of middle-class nursery-school children and children from Head Start programs are presented, which show that while 80-90% of nursery-school children exhibit mastery of color information, only 20% of Head Start children do so. Similar differences are reported for mastery of position, shape, and number. Within the Head Start group, black and white Ss' performance did not differ. (93 ref)—*Journal abstract.*

4094. Kicklighter, Richard H.; Powell, John & Parker, James. (Georgia State Dept of Education, Atlanta) **The Peabody Picture Vocabulary Test and naive versus trained examiners.** *Journal of Experimental Education*, 1974(Sum), Vol 42(4), 27-29.—To verify marketing claims that the Peabody Picture Vocabulary Test is suitable for use by persons without special training in testing, a total of 40 7-11 yr olds, ranging from retarded to gifted, were tested in counterbalanced order by 8 elementary school teachers and by 3 school psychologists. No significant differences were found between the Ss' mean IQs in the experienced vs the naive examiner's data, and there were no significant treatment effects, trial effects, or interactions. However, differences in the test results for certain individuals were large, suggesting the necessity for cautious use in the absence of corroborating data.—*Journal abstract.*

4095. Leviton, Harvey & Kiraly, John. **The effects of a short training program on the Draw-A-Man Test scores of pre-school children.** *Educational & Psychological Measurement*, 1974(Sum), Vol 34(2), 435-438.—Used 61 preschool children, in 2 experimental groups and a control group, as Ss in a study designed to test the prediction that a preschool enrichment program could improve performance on the Harris-Goodenough Draw-a-Man Test. Results supported the prediction and are discussed in terms of the validity of the test as a measure of intellectual ability. It is suggested that the test be used as an indicator of school readiness because of its sensitivity to readiness experiences, rather than as an indicator of intelligence.—*Journal abstract.*

4096. Lewis, John. (Winona State Coll) **A pictorial attitude scale for elementary pupils.** *Educational & Psychological Measurement*, 1974(Sum), Vol 34(2), 461-462.—Describes the Children's Pictorial Attitude Scale, designed to provide a nonverbal measure of children's attitudes toward elementary school. The scale was developed by identifying areas of activities and drawing pictures representing these areas. Children are instructed to respond according to how they would feel in one of these picture situations. The scale yielded a split-half reliability coefficient of .69 from 607 pupils in Grades 1-6. Scores on the scale have discriminated among pupils in the 6 grade levels.—*Journal abstract.*

4097. Lewis, John. (Winona State Coll) **A study of the validity of the SRA tests of general ability.** *Educational & Psychological Measurement*, 1974(Sum), Vol 34(2), 433-434.—Conducted a validity study on the Science Research Associates Ability Series. Ss were 289 pupils, Grades 1-6. The criteria were teachers' ratings. The obtained validity coefficient varied from .42 for Grade 3 to .61 for Grade 4. Smaller criterion standard deviations for Grades 1-3 should be considered in interpreting the

relatively lower validity coefficients for these 3 lower grades.

4098. Lewis, John. (Winona State Coll) **A study of the validity of the Metropolitan Readiness Tests.** *Educational & Psychological Measurement*, 1974(Sum), Vol 34(2), 415-416.—40 pupils who had just completed kindergarten were administered the Metropolitan Readiness Test. Lee-Clark Reading Readiness Test scores and teacher ratings were obtained as criteria measures after Ss had completed the 1st grade. The validity coefficient was .67 with Lee-Clark scores and .61 with teacher ratings.

4099. Little, Dolores M. & Roach, Arthur J. (Texas A&M U) **Videotape modeling of interest in nontraditional occupations for women.** *Journal of Vocational Behavior*, 1974(Aug), Vol 5(1), 133-138.—Investigated peer social modeling of interest in nontraditional occupations for women as a possible technique in career counseling. Ss in treatment and control groups were female undergraduate, undeclared majors in a liberal arts curriculum ( $N = 32$ ). 2 series of videotaped films, with sex of counselor as a controlled variation of the modeling, were presented to 2 experimental groups. Selected criteria from the Vocational Preference Inventory and a simulated career choice indicated a significant increase in interest in nontraditional occupations by Ss viewing a modeling series with reinforcement by a male counselor.—*Journal abstract.*

4100. Lynch, Mervin D. & Edwards, Thomas M. (Northeastern U) **The Miniscat: Its development and some evidence of its validity.** *Educational & Psychological Measurement*, 1974(Sum), Vol 34(2), 397-405.—Describes an elementary grade creativity test, in which word doublets (e.g., peanut and fly) are to be responded to by a third word (e.g., butter). Items represent 6 different associative rule structures. 1st and 3rd graders were judged high or low in creativity from their responses to a story completion test. Ss high in creativity had appreciably higher Miniscat scores than those low in creativity—an outcome supporting the validity of the test. Scores for Grade 3 were higher than for Grade 1 on Form B of the test but not on Form A. Girls scored higher than boys on Form A but not on Form B. Split-half reliability coefficients were high and consistent. The judges of creativity were themselves tested for creativity. Their creativity scores were unrelated to their judgments of children's creativity—a finding that failed to support the notion that it takes a creative person to recognize one.—*Journal abstract.*

4101. Maier, Dennis & Herman, Al. (Preventive Social Service, Provost, Alberta, Canada) **The relationship of vocational decidedness and satisfaction with dogmatism and self-esteem.** *Journal of Vocational Behavior*, 1974(Aug), Vol 5(1), 95-102.—Administered the Rok-each Dogmatism Scale (Form E), the Tennessee Self-Concept Scale, and a personal-data questionnaire to 141 college freshmen. The relationship of levels of vocational decidedness and the satisfaction or dissatisfaction of Ss' level of vocational decidedness with dogmatism and self-esteem was analyzed. Results indicate that vocationally decided and undecided Ss represented uniquely different populations on measures of dogmatism and self-esteem. (17 ref)—*Journal abstract.*

4102. Malpas, A. J. & Brown, Margaret. (Chelsea Coll, U London, England) **Cognitive demand and difficulty of GCE O-level mathematics pretest items.** *British Journal of Educational Psychology*, 1974(Jun), Vol 44(2), 155-162.—2 judges assessed 720 mathematics items from pretests written for 2 different syllabuses for "concrete" or "formal" demands, using criteria derived from Piaget's theory of cognitive development. The mean difficulty indices for items placed in concrete and formal categories were compared to test the hypothesis that items classified as making higher demands would be found more difficult. Results show that while there was some variability, there was significant agreement between the judges ( $p < .001$ ) in the placing of the items and a significant correlation ( $p < .001$ ) between classification category and the difficulty index of the items. An unexpected difference between the 2 syllabuses in the distribution of items over concrete and formal categories was also discovered. Several possible interpretations of these results are discussed, and ways of making criteria for formal and concrete operations more rapidly applicable to such mathematical activities as the solution of multiple choice examination items are examined. (15 ref)—*Journal abstract.*

4103. Mandryk, Thomas R. & Schuerger, James M. **Cross-validation of the HSPQ as a predictor for high school grades.** *Educational & Psychological Measurement*, 1974(Sum), Vol 34(2), 449-454.—Used Cattell's High School Personality Questionnaire (HSPQ) to predict achievement on a sample of 469 high school students, and compared estimates of achievement with observed values. Multiple linear regression was performed twice; HSPQ scores alone and HSPQ scores in combination with 2 ability measures. Results indicate that (a) the beta weights derived in the present study were essentially consistent with those used by Cattell, (b) one-fourth of the variance associated with achievement was accounted for by personality factors, and (c) predicted achievement scores using Cattell's equation correlated relatively highly with observed scores.—*Journal abstract.*

4104. Massonnat, Jean. (National Ctr for Scientific Research, U Provence, Marseille, France) **[The counseling interview in an educational orientation procedure.]** (Fren) *Cahiers de Psychologie*, 1972, Vol 15(1-2), 59-81.—Examined the way 33 9th-grade students viewed themselves, their studies, and future career plans within family, school, and social situations. Orientation was provided through 2 counseling interviews 3-4 mo apart; interviews proceeded according to detailed schedules of content and were coded as to content and direction by counselors. Results at the end of the year show that while evidencing some growth in environmental perception and self-concept, pupils failed to show greater application of the information and understanding acquired in formulating their plans or preparatory studies. There was no significant increase in the number or scope of scholastic and environmental factors identified as determinants of individual choice. (English summary) (19 ref)—*E. E. Brown.*

4105. Moore, Clifford L. & Retish, Paul M. (U Iowa) **Effect of the examiner's race on black children's Wechsler preschool and primary scale of intelligence**

**IQ. Developmental Psychology.** 1974(Sep), Vol 10(5), 672-676.—Used a test-retest design to investigate the effect of examiner's race on the IQ scores of 28 male and 14 female low-income black 47-69 mo old preschoolers. 6 female examiners, 3 black and 3 white, administered an abbreviated form of the Wechsler Preschool and Primary Scale of intelligence to the Ss. Each S was tested by a black examiner and by a white examiner. Results indicate that the main effect of the examiner's race was significant for the Verbal, Performance, and Full-Scale IQs. The children earned higher mean scores when tested by the examiner of similar ethnic origin. A significant administration effect and Administration  $\times$  Sex effect was revealed on the Verbal scale. (37 ref)—*Journal abstract*.

4106. Neise, Karl. [The problem of precision of test diagnoses.] (Germ) *Praxis der Kinderpsychologie und Kinderpsychiatrie*, 1974(Feb), Vol 23(2), 62-67.—Surveys the current scientific discussion on the utility of intelligence tests. A formula for determining standard errors and confidence limits is presented. The use of profile analysis of intelligence tests as probabilistic statements is discouraged. (19 ref)

4107. O'Shea, Arthur J. & Harrington, Thomas F. (Boston State Coll) **Measuring the interests of male and female students with the SVIB for men.** *Measurement & Evaluation in Guidance*, 1974(Jul), Vol 7(2), 112-117.—Examined the Strong Vocational Interest Blank for Men profiles of 89 male and 113 female counselor education students to determine the extent of sex differences. The differential predictive validity of the SVIB was also studied. Both male and female Ss had similar overall SVIB profiles. However, there were distinct differences along the lines of sex-role stereotypes. The SVIB did not have differential predictive power among various counseling groups—elementary, secondary, college, and community. Results support the direction which the new SVIB is to take.—*Journal abstract*.

4108. Omvig, Clayton P. & Thomas, Edward G. (U Kentucky) **A socioeconomic comparison of vocational interests: Implications for counseling.** *Journal of Vocational Behavior*, 1974(Aug), Vol 5(1), 147-155.—Assessed the effects of socioeconomic status on results obtained from the Ohio Vocational Interest Survey (OVIS). The sample consisted of 200 9th graders, half of whom represented the inner-city disadvantaged, with the remaining half representing a high socioeconomic level. Disadvantaged males displayed significantly higher interests for all 24 OVIS work areas; disadvantaged females recorded significantly higher interests for 18 of the 24 work areas. Established OVIS norms were compared with the interest patterns of each group, thus providing a reference point from which to work when counseling special students. It is concluded that established norms were of little value in interpreting OVIS results to inner-city disadvantaged students, especially males. (18 ref)—*Journal abstract*.

4109. Otto, Luther B.; Haller, Archibald O.; Meier, Robert F. & Ohlendorf, George W. (Washington State U) **An empirical evaluation of a scale to measure occupational aspiration level.** *Journal of Vocational Behavior*, 1974(Aug), Vol 5(1), 1-11.—Used data from 34,118

American high school students to evaluate the Occupational Aspiration Scale (OAS). The OAS was successively reevaluated for each of 16 subsamples generated by cross-classifying respondents by grade in school (9-12), sex, and socioeconomic status (SES). The reliability of the OAS was slightly lower among females than among males; it did not vary appreciably by grade or SES. The mean scores were lower for youth from low SES families than for those from high SES families. No important differences by age, sex, or SES were found in the standard deviations of the test scores. Results indicate that the reliability and validity of the OAS are sufficient for research on high school youth of both sexes and from both higher and lower SES levels. (20 ref)—*Journal abstract*.

4110. Pitkalski, John J. (U Delaware, Reading Study Ctr) **Assessment of pre-reading skills: A review of frequency employed measures.** *Reading World*, 1974(Mar), Vol 13(3), 171-197.—Describes the dimensions that have been investigated as contributors to a child's readiness for learning to read. Literature on the Bender Gestalt Test, the Marianne Frostig Developmental Test of Visual Perception, and the Illinois Test of Psycholinguistic Abilities is reviewed to determine the extent to which published research has raised or resolved questions regarding the use of these instruments, particularly as they relate to evaluating the pre-first-grade child. Test usefulness is evaluated in terms of what the instrument reveals about the reading process and about its necessary prerequisites. The Peabody Picture Vocabulary Test, the Stanford-Binet Intelligence Scale, and the Wechsler Preschool and Primary Scale of Intelligence are also reviewed. (58 ref)—*R. S. Albin*.

4111. Pinto, Louise R. & Feigenbaum, Louis. (City Coll, City U New York) **Effects of clinical counseling on college achievement.** *Journal of Counseling Psychology*, 1974, Vol 21(5), 409-414.—To investigate the effects of clinical counseling on the academic achievement of college students, each of 132 counseled students was compared to a "hypothetical twin" which represented the average of 5 noncounseled students closely matched to the counseled students on each of 5 control dimensions: age, sex, high school average, number of college credits, and cumulative index. No significant differences in achievement were found between counseled students and their controls. However, when counseled students were grouped according to the counselor they had seen, significant differences emerged.—*Journal abstract*.

4112. Plass, Howard; Michael, Joan J. & Michael, William B. **The factorial validity of the Torrance Tests of Creative Thinking for a sample of 111 sixth-grade children.** *Educational & Psychological Measurement*, 1974(Sum), Vol 34(2), 413-414.—Performed a factor analysis of 30 measures of the Torrance Tests of Creative Thinking administered to a sample of 111 6th graders. Each of the 7 rotated factors described a task (content) rather than an hypothesized psychological process for which a task was scored.

4113. Price, Gary E. (St John's U, Jamaica, NY) **Counselor and computer effectiveness in helping students select courses.** *Journal of Counseling Psychology*, 1974, Vol 21(5), 351-354.—Compared the effectiveness of a computer-based counseling system with a

counselor-based system in helping students explore and select high school courses. Ss were 96 students in Grades 9-11. No significant differences were found in grades received and number of courses changed between the students using counselor-assisted and computer-assisted course selection procedures.—*Journal abstract.*

4114. Pryor, Norman M. & Gordon, Michael E. (Ford Motor Co, Detroit, MI) **A statistical model for the examination of the validity of prerequisites.** *Educational & Psychological Measurement*, 1974(Sum), Vol 34(2), 349-355.—Compared the grades in upper-division classes of students who had and had not completed the "necessary" prerequisite courses, using a multivariate analysis of variance procedure known as step-down analysis. This made it possible to determine the actual importance of the lower-division courses for future academic success. Grade point average was the variable most closely associated with the level of performance in the target courses, whereas the percentage of prerequisites accounted for only 2% of the variance. Results are examined in the light of possible revisions in admission requirements for upper-division courses.—*Journal summary.*

4115. Reid, Ivan & Cohen, Louis. (U Bradford, School of Research in Education, England) **Male and female achievement orientation and intellectual responsibility: A British validation study.** *Educational & Psychological Measurement*, 1974(Sum), Vol 34(2), 379-382.—Administered anglicized versions of the Mehrabian Achievement Orientation Scale and a modified Crandall Intellectual Achievement Responsibility Scale to 168 British students of teacher education who were similarly qualified academically but had variously chosen degree and nondegree college programs. The Crandall Scale differentiated between degree and nondegree course students in both male and female samples. The Mehrabian scale differentiated between degree and nondegree course students in the female sample only. Results are discussed in the light of cultural and institutional differences between British and American students.—*Journal abstract.*

4116. Rubin, Rosalyn A. (U Minnesota) **Preschool application of the Metropolitan Readiness Tests: Validity, reliability, and preschool norms.** *Educational & Psychological Measurement*, 1974(Sum), Vol 34(2), 417-422.—Followed 910 Ss from prekindergarten through the latter part of 1st grade. Prekindergarten scores on the Metropolitan Readiness Tests (MRT) correlated .65 with MRT scores obtained 1 yr later at pre-1st grade level. Prekindergarten scores also predicted late 1st grade achievement in reading, spelling, and arithmetic approximately as effectively as scores obtained at pre-1st grade level. Prekindergarten MRT norms based on the study sample are presented.—*Journal abstract.*

4117. Scott, C. S.; Fenske, R. H. & Maxey, E. J. (American Coll Testing Program, Iowa City, IA) **Vocational choice change patterns of a national sample of community-junior college students.** *ACT Research Report*, 1974(May), No 64, 10 p.—Examined changes in expressed vocational choices made over an 18-mo period by a sample of students who were each enrolled in 1 of 62 2-yr institutions. Ability, interest, and family back-

ground measures, including the Career Planning Profile, were used as independent variables. Results indicate that (a) vocational choice changers were very similar to nonchangers in terms of the 23 independent variables examined, (b) vocational choice change patterns varied widely among groups of changers, and (c) there were very substantial differences in the choice changes made by males and females. Theoretical and practical implications of the findings are discussed.—*Journal abstract.*

4118. Shutt, Darold L. & Hannon, Thomas A. (Northern Arizona U) **The validity of the HNTLA for evaluation of the abilities of bilingual children.** *Educational & Psychological Measurement*, 1974(Sum), Vol 34(2), 429-432.—Studied groups of 50 Mexican-American and 50 Navajo students enrolled in special education classes in Arizona. 6 test administrators were used. For the combined sample, a significant correlation was found ( $p < .01$ ) between subtests of the HNTLA and those of the WISC Performance Scale.

4119. Tapp, George S. & Barclay, James R. (Morehead State U) **Convergent and discriminant validity of the Barclay Classroom Climate Inventory.** *Educational & Psychological Measurement*, 1974(Sum), Vol 34(2), 439-447.—Using self-report, peer judgments, and teacher ratings, the inventory employs the multimethod multitrait factor analysis approach. A computer processing procedure, utilizing criteria developed in this approach, scores, analyzes, and develops a written report on each pupil. These reports can be cumulated to result in descriptions of the social interaction and affective environment in the classroom. A questionnaire comprised of short paragraphs defining the major factors from the inventory was administered to 9 elementary classrooms. Each student rated himself for each of the factors, and was, in turn, rated by a randomly selected peer and the teacher. These 3 rating sources combined with the inventory's factor scores to form a 5-trait, 4-method matrix for the assessment of convergent and discriminant validity. Considerable evidence for these aspects of validity was found.—*R. W. Covert.*

4120. Tatham, Clifford B. & Tatham, Elaine L. (Research Hosp & Medical Ctr, Kansas City, MO) **Academic predictors for black students.** *Educational & Psychological Measurement*, 1974(Sum), Vol 34(2), 371-374.—Designated 45 black males and 28 black females as either academically successful (graduation, or grade point average of at least 1.0) or academically unsuccessful. A 2-way (Sex  $\times$  Academic Success) multivariate analysis of variance indicated that with respect to standard scores on the Scholastic Aptitude Test, Verbal and Mathematical, and on the High School Readiness test, males differed significantly from females ( $p < .005$ ). The successful males differed from the unsuccessful males with respect to these 3 variables, but no such difference was found for females. It is concluded that measures of academic achievement should not be the only measures used in selecting black students for admittance to college; others, such as motivation and socioeconomic background, also need to be considered.—*Journal abstract.*

4121. Taylor, George R. & Jackson, Margaret H. (Coppin State Coll) **The effects of direct intervention on school tardiness.** *Southern Journal of Educational Re-*

search, 1974(Spr), Vol 8(4), 272-279.—Sought to determine if intervention initiated by school personnel could successfully reduce the tardiness rate in 13 students in a metropolitan junior high school. Ss had a record of habitual tardiness in Grades 7 and 8. It was hypothesized that the tardiness rate would be significantly decreased after intervention. Data were collected from official school records, interviews, and survey forms. Results indicate that the tardiness rate was significantly reduced by the end of the 9th yr.—*Journal abstract.*

4122. Tsuji, Kazuko. [A study on the therapist's contribution to counseling with junior high school students.] (Japn) *Japanese Journal of Educational Psychology*, 1973(Mar), Vol 21(1), 43-47.—Studied 5 dimensions of therapeutic response, analyzing data provided by 10 Rogerian therapists and 10 counselors of middle school students responding to a questionnaire. The dimension of unconditional positive regard was found to be most effective. (English summary)

4123. Wallner, Nancy K. (Mississippi State U) **The development of a listening comprehension test for kindergarten and beginning first grade.** *Educational & Psychological Measurement*, 1974(Sum), Vol 34(2), 391-396.—Developed and validated 2 forms of a test of listening comprehension which fulfilled 2 of the 3 statistical criteria for parallel tests. The alternate-form and internal reliabilities were high. Content, criterion-related, and predictive validities were established.

4124. Washington, Kenneth R. & Anderson, Norma J. (U Massachusetts, School of Education, Amherst) **Scarcity of black counselors: A crisis in urban education.** *Journal of Non-White Concerns in Personnel & Guidance*, 1974(Jan), Vol 2(2), 99-105.—Questions whether positive counseling can occur in a black counselor-white counselor dichotomy and whether the attitudes of white guidance counselors can be modified through effective preservice and inservice programs. A review of the literature on the topic indicates a need for more black counselors and for the development of preservice and inservice programs that address themselves to the cultural and experiential differences which exist between white counselors and black students.—*M. E. Pounsel.*

4125. Wasik, John L. (North Carolina State U) **Teacher perceptions of behaviors associated with creative problem solving performance.** *Educational & Psychological Measurement*, 1974(Sum), Vol 34(2), 327-341.—Conducted a study to determine the perceptual cues used by teachers to identify creative problem-solving ability. A battery of 8 Structure of Intellect (SI) ability tests was administered to 162 10th grade students of 1 suburban school. Ratings of student creative problem-solving ability obtained from 4 teacher teams were compared with the SI measures by using Christal's judgment analysis procedure. It is concluded that the 4 teacher teams were using the same cues (SI abilities) in rating students in terms of their ability to solve problems creatively, and that these cues were related to types of abilities measured by scholastic aptitude tests. (21 ref)—*Journal abstract.*

4126. Williams, Clarence G. (Massachusetts Inst of Technology, Graduate School) **A model for counseling "high promise" minority freshmen.** *Journal of Non-*

*White Concerns in Personnel & Guidance*, 1974(Jan), Vol 2(2), 87-93.—Offers a model for effectively bringing more minority students into the mainstream of university life. The model provides for professional counselors who carry out the fundamental aims of any typical university program. Specifically, in an attempt to achieve both long-term and immediate goals, the model includes individual counseling, faculty consultations, residence hall counselors, residence hall visitations, group process, teachers' and counselors' consultations, a follow-up program, and auxiliaries. It is stressed that face-to-face interviews between counselor and student and extensive training and background experience relative to minority groups on the part of the counselor are basic to the success of the program.—*M. E. Pounsel.*

APPLIED PSYCHOLOGY

4127. Almquist, Elizabeth M. (North Texas State U) **Sex stereotypes in occupational choice: The case for college women.** *Journal of Vocational Behavior*, 1974(Aug), Vol 5(1), 13-21.—The choice of a male-dominated occupation rather than a traditionally feminine one was the single occupational variable which meaningfully divided a class of 110 women who were studied intensively over the 4 yrs of college. Women who chose occupations which employ largely men differed predictably from women who selected feminine occupations in terms of familial influence, work values, work experience, role-model influence, and some collegiate activities. The 2 groups did not differ appreciably in sociability experiences or in relationships with parents, so it cannot be argued that work plans of women pioneering in a "male" occupation stem from social isolation, rejection, or lack of appropriate feminine socialization. (15 ref)—*Journal abstract.*

4128. Belk, Russell W. (Temple U) **An exploratory assessment of situational effects in buyer behavior.** *Journal of Marketing Research*, 1974(May), Vol 11(2), 156-163.—Considers that circumstances, contexts, and situations are often cited but rarely studied as explanations for unpredicted behaviors. The amounts and patterns of variance in selected purchase decisions were studied as a function of consumption and purchase contexts. Based on the work of H. Triandis, a "behavioral differential inventory" was developed on which respondents indicate the likelihood that they would make each of a number of responses to a stimulus configuration. 100 adults from 5 business, social, and church groups completed the inventory for 2 product categories (snacks and meats) and 10 situations. Results demonstrate that a large amount of situational influence determines consumer preferences; situational main effects and interactions accounted for almost half the explained variance in meat and snack preferences. Implications for additional research on theoretical problems concerning the relationship of attitudes, personality, and brand loyalty to consumer behavior are discussed. (31 ref)—*L. Gorsey.*

4129. Blum, Milton L.; Stewart, John B. & Wheatley, Edward W. (Florida International U, School of Arts & Sciences) **Consumer affairs: Viability of the corporate**

response. *Journal of Marketing*, 1974(Apr), Vol 38(2), 13-19.—The typical function of newly established departments of consumer affairs in corporations is to coordinate existing departments and improve communication. It is suggested that much more emphasis should be placed on research and innovation. New measures of consumer satisfaction and new methods of diagnosing consumer dissatisfaction are needed.

4130. Bush, Ronald F.; Gwinner, Robert F. & Solomon, Paul J. (U Mississippi, School of Business Administration) **White consumer sales response to black models.** *Journal of Marketing*, 1974(Apr), Vol 38(2), 25-29.—Carried out a controlled sales test in 3 supermarkets using point-of-purchase displays set up with and without black models. No significant differences occurred in sales responses of white consumers to promotional materials utilizing (a) all white models, (b) all black models, or (c) white and black models (integrated). Observations were recorded for 13,443 white consumers during the experiment. (22 ref)—D. W. Twedt.

4131. Cunningham, William H.; Moore, Russell M. & Cunningham, Isabella C. (U Texas, Coll of Business Administration, Austin) **Urban markets in industrializing countries: The São Paulo experience.** *Journal of Marketing*, 1974(Apr), Vol 38(2), 2-12.—Studied the purchasing behavior of a stratified random sample of 602 residents of São Paulo, Brazil. 52% were upper lower class, 15% were lower lower class, and the rest were distributed rather evenly among the top 4 social classes. Purchasing behavior and the importance of different advertising media as sources of purchase information varied significantly by social class. (17 ref)—D. W. Twedt.

4132. Czepiel, John A. (New York U) **Word-of-mouth processes in the diffusion of a major technological innovation.** *Journal of Marketing Research*, 1974(May), Vol 11(2), 172-180.—Presents a microanalytic study of the use of word-of-mouth processes among decision makers in competitive firms in diffusing a major technological innovation (in this study, the use of the continuous casting process in the steel industry). Structured interviews were conducted with 31 of those managerial and technical persons who were directly involved in making the initial recommendation to use continuous casting. The assessment determined (a) whether respondents had contacted any other sources for information about the innovation; (b) whether, after their decision to adopt the innovation, any firms had contacted them for information; and (c) whether respondents had any regular opinion/advice relationships with other firms. Findings indicate the existence of a functioning informal community linking the firms together. The finding of active friendship relationships in information seeking reinforces the idea of diffusion as a behavioral and social process. Data on opinion leadership and centrality in opinion/advice networks are also presented. (23 ref)—L. Gorsey.

4133. Ehrenberg, Andrew S. (London Graduate School of Business Studies, England) **Repetitive advertising and the consumer.** *Journal of Advertising Research*, 1974(Apr), Vol 14(2), 25-34.—An Awareness Trial Repeat purchase approach as to how advertising works is

proposed as an alternative to the conventional Awareness Attitudes Behavior model. This recommendation is based on the argument that consumers' attitudes toward similar brands are very similar and that they tend to ignore advertising for brands they are not already using; therefore there is little scope for persuasive advertising. Advertising's main role is to reinforce feelings of satisfaction for brands already being used. (26 ref)—J. C. Franklin.

4134. Erdos, Paul L. (Erdos & Morgan, New York, NY) **Employee surveys.** *Personnel Journal*, 1974(Apr), Vol 53(4), 294-300.—Discusses several specific purposes for soliciting opinions from employees and managers. Areas to be covered in such surveys are described and typical letters to respondents are shown.

4135. Eye, Glen G. (U Wisconsin, Madison) **Knowledge abundance in an environment of scarcity.** *Journal of Educational Research*, 1974(Jul-Aug), Vol 67(10), 445-447.—Contrasts the recent marked increase in the quantity of knowledge with the marked decrease in materials. The tendency to falsely assume that materials are as inexhaustible as knowledge is discussed. It is argued that while both knowledge and materials are marketable commodities, different laws govern each.

4136. Fox, William M.; Hill, Walter A. & Guertin, Wilson H. (U Florida, Coll of Business Administration) **Dimensional analysis of the Least Preferred Co-Worker scales.** *Journal of Applied Psychology*, 1973(Apr), Vol 57(2), 192-194.—Administered the least preferred co-worker scales to 114 Internal Revenue tax examiners, 147 US Marines, and 180 British managers in an electronics firm. Comparative factor analyses of responses show that it was possible to identify several dimensions of coworker perceptions measured by the LPC scales: Hostile-Ineffective, Remote-Rejecting, Tense, Ineffective-Boring, and Hesitant.

4137. Frank, Austin C. & Kirk, Barbara A. (U California, Berkeley) **Factors within the 1969 SVIB for Women and relationships to Holland's theory.** *Journal of Vocational Behavior*, 1974(Aug), Vol 5(1), 79-94.—Assigned Holland codes to the Basic Interest Scales (BIS) and the Occupational Scales (O-S) of the revised Strong Vocational Interest Blank for Women. Component scores of 206 female students on the BIS and O-S were separately developed, intercorrelated, and evaluated along with standardized composite scores representing each of the 11 O-S groups on the profile. The dimensionality of the BIS and O-S was similar, and similar in number to J. L. Holland's theory, but the components were only partially congruent. Some profile groups provided relatively good representations of BIS and/or O-S components, and the grouping of the O-S provided important information not otherwise readily available. Fundamental problems of compatibility appeared to exist in relating the structure of this instrument to Holland's formulations. (15 ref)—*Journal abstract.*

4138. Gaffey, Robert L. & Walsh, W. Bruce. (Community Mental Health Clinic, Delaware, OH) **Concurrent validity and Holland's theory.** *Journal of Vocational Behavior*, 1974(Aug), Vol 5(1), 41-51.—Used 4 different operational definitions of vocational orientation to explore the relationships among all possible combinations of same named scales across the 4 inventories.

Concurrent validity was studied by administering the Vocational Preference Inventory (VPI), the Self-Directed Search (SDS), and the Holland scales (Sets I and II) to 153 male workers established in occupational environments consistent with J. L. Holland's 6 vocational environments. Results reveal that 5 scales of the VPI and of the Holland scales and 4 scales of the SDS successfully differentiated the occupational groups consistent with Holland's theoretical framework. All of the correlation coefficients for same named scales for all possible combinations of the 4 inventories were significant and support the validity of Holland's theory.—*Journal abstract*.

4139. Goldman, Roy D.; Platt, Bruce B. & Kaplan, Robert B. (U California, Riverside) **Dimensions of attitudes toward technology.** *Journal of Applied Psychology*, 1973(Apr), Vol 57(2), 184-187.—Administered an 80-item questionnaire measuring attitudes toward mechanization to 45 undergraduate students in physical science, biological science, social science, and fine arts. Responses were factor analyzed using a varimax rotation. Factor scores were created for 6 of the resulting factors: Global Mechanism, Mechanical Curiosity, Preference for Hand-made Goods, Alienation, Spiritual Benefits of Technology, and Human Vitalism. These factor scores were then used as dependent variables in a multivariate comparison of the students in different major fields. Most of the between-group differences in attitude toward mechanization were reflected by differences in mechanical curiosity.—*Journal abstract*.

4140. Guttentag, Marcia. (Harvard U) **Subjectivity and its use in evaluation research.** *Evaluation*, 1973, Vol 1(2), 60-65.—Describes a new model for evaluation research based on the assumption that the inherent subjectivity of decision-making renders classical experimental designs and tests of significance irrelevant to most program evaluation. An alternative approach is derived from decision theory using W. Edwards's method (1971) of measuring multi-attribute utilities (MAU) to quantify decision-makers' subjective judgments about the value of projects. A detailed example of the use of MAU in program planning is presented. An illustration is given of how the outcomes of MAU planning provide evaluation researchers with hypotheses which they can test when objective data eventually replaces the subjective judgments used originally. Bayesian rather than traditional statistical procedures are recommended.—*J. Adams-Webber*.

4141. Hallstrom, Arne G. [The power of prisoners of war to resist interrogation: An overview based on literature study.] (Swed) *MPI A-Rapport*, 1974(Jun), No 26, 26 p.—Notes that methods of obtaining information from prisoners of war and methods of preventing a country's own personnel from revealing information to the enemy have been studied thoroughly, especially in the US after the Korean war. The present study investigated the predictive utility of these methods. It is concluded that generalizations about the firmness of resistance cannot be produced, and if they could be developed, they would probably be on a continuum ranging from qualified and firm to weaker and weaker resistances. If one were aware of the ideologies and interrogation practices on both sides during a war, the

necessary conditions for judging the power of prisoners of war to resist interrogation could be more easily established.—*English abstract*.

4142. Harless, J. H. (Harless Performance Guild, McLean, VA) **An analysis of front-end analysis.** *Improving Human Performance*, 1973(Win), Vol 2(4), 229-244.—Describes the goals and procedures of front-end analysis and discusses ways in which humans can intervene in the performance of another (a) by giving instruction on how and when to make responses, (b) by offering incentives and favorable consequences for desired responses, and (c) by changing the environment in which the responses occur. 4 alternate processes are outlined, and an example of the application of front-end analysis to a specific problem is included.—*B. McLean*.

4143. Harlow, Dorothy N. (U South Florida, Coll of Business Administration) **Professional employees' preference for upward mobility.** *Journal of Applied Psychology*, 1973(Apr), Vol 57(2), 137-141.—Examined why some engineers are more interested than others in upward mobility. The hypotheses were based on R. Presthus's 1962 accommodation theory. 54 graduate engineers completed questionnaires measuring job satisfaction (JS), ambiguity tolerance (AT), and promotional preference (PP). For the total sample, PP and JS were positively correlated ( $p < .05$ ), supporting the theory. AT and PP were also positively correlated for Ss above the median on JS, contrary to the theory. However, AT and PP were negatively correlated for 33 engineering managers. Although data from professional employees did not support the theory regarding AT, it is possible that the individual's career stage should also be considered.—*Journal abstract*.

4144. Imundo, Louis V. (Wright State U) **Attitudes of non-union white-collar federal government employees toward unions.** *Public Personnel Management*, 1974(Jan), Vol 3(1), 87-92.—Surveyed the attitudes toward unions held by nonpostal white-collar government employees who are represented by a union but are not dues-paying members. The sample, randomly selected, consisted of 500 white-collar workers, 10% of those employed at an Air Force base in Ohio. The sampled workers are exclusively represented by a union. 170 usable responses to a mailed questionnaire were received. Workers in the 30-50 yr age group were pro-union and were dissatisfied with their current working conditions, yet were not dues-paying union members. There appear to be 2 reasons for the contradiction. These workers are apprehensive of union power, and they have union representation without paying dues. To increase dues-paying membership, it is suggested that the union should design its promotional appeals around reinforcement of pro-union and reduction of anti-union sentiment.—*S. E. Bowser*.

4145. Johnson, Richard M. (Market Facts, Inc., Chicago, IL) **Trade-off analysis of consumer values.** *Journal of Marketing Research*, 1974(May), Vol 11(2), 121-127.—Describes a computational method for exploring and quantifying value systems of consumers through conjoint measurement. The 3 components of the method are (a) a technique of data collection requiring respondents to consider "trade-offs" among desirable alternatives, (b) a method which derives "utilities" accounting as nearly as possible for each respondent's

choices, and (c) a market simulation model which determines those product attributes that maximize its share of preference within any particular competitive market; the model assumes that the attributes under study are independent and allows for their interaction using Kendall's tau and phi statistics. The advantages of this procedure, external validation data, and other evidence of its appropriateness are discussed.—*L. Gorsey.*

4146. **Jonnada, Rama K. & Fegley, Kenneth A.** (Bell Telephone Lab, Whippany, NJ) **Path analysis in systems science.** *IEEE Transactions on Systems, Man, & Cybernetics*, 1974(Sep), Vol 4(5), 418-424.—Discusses the application of path analysis to the development and evaluation of causal models, which are useful in systems science applied to such typical areas as biological, behavioral, and social systems. Path analysis is described and illustrated with examples, and its usefulness to systems engineers involved in the development of information systems is pointed out.

4147. **Kinnear, Thomas C.; Taylor, James R. & Ahmed, Sadrudin A.** (U Western Ontario, School of Business Administration, London, Canada) **Ecologically concerned consumers: Who are they?** *Journal of Marketing*, 1974(Apr), Vol 38(2), 20-24.—Explored the relationship between socioeconomic and personality characteristics of consumers and the amount, if any, of ecological concern they indicate. Personality data were based upon mail questionnaires returned by 500 members of the Canadian Family Opinion-University of Western Ontario Consumer Panel. Ecologically concerned consumers scored high in perceived consumer effectiveness against pollution, high in openness to new ideas (tolerance), high in need to understand the workings of things and satisfy intellectual curiosity (understanding), and moderately high in their need to obtain personal safety (harm avoidance). A marketing implication is that an ecologically concerned segment of the population may be large enough to warrant exploitation.—*D. W. Twedt.*

4148. **Kirk, Kenneth W.; Johnson, Richard W. & Ohvall, Richard A.** (U Wisconsin, School of Pharmacy, Madison) **Interests of women pharmacists.** *Vocational Guidance Quarterly*, 1974(Mar), Vol 22(3), 200-208.—Developed a pharmacist scale for the Strong Vocational Interest Blank for Women. A mailed questionnaire was completed by 1,341 female pharmacists. The occupational criterion group was defined: 25-55 yrs old, employed 3 or more yrs, liked her work, and state licensed. A sample of 646 women met these criteria, and 67 items were found that differentiated women pharmacists from women in general. These pharmacists scored high on the biological science and medical service basic scales. Male pharmacists, on the other hand, scored high on the merchandising and medical sciences scales. These sex differences are reflected in the job roles assumed by women and men pharmacists: females are more likely to become hospital pharmacists and men to become community pharmacists.—*R. S. Albin.*

4149. **Lehmann, Donald R. & O'Shaughnessy, John.** (Columbia U, Graduate School of Business) **Difference in attribute importance for different industrial products.** *Journal of Marketing*, 1974(Apr), Vol 38(2), 36-42.—Conducted a binational study of how industrial buyers

evaluate 4 categories of products. Purchasing agents for 19 major US companies and 26 major British companies were asked to indicate on a semantic differential scale the relative importance to them, in choosing a supplier for each type of product, of each of 17 attributes. It was found that suppliers must promote their products in terms of how they are to be used. US and British purchasing agents differed as to the importance assigned to some attributes, indicating that multinational suppliers might need to use different marketing strategies for different national markets.—*D. W. Twedt.*

4150. **Matsumoto, Kei; Kawaike, Kooji; Yoshida, Syuzo & Sameshima, Kazuko.** (Kagoshima U, Faculty of Medicine, Japan) **[The influence upon psychoactivity of high temperature and fatigue.]** (Jpn) *Kyushu Neuro-psychiatry*, 1971(Oct), Vol 17(2), 80-84.—Studied the degree of fatigue of 11 medical and 7 nursing students as measured by the Uchida-Kraepelin test. From July 26 through August 1, 1971, all Ss worked from 5:30 AM to 6 PM under the mean temperature of 32° C or higher. Results of the 1st test, given on July 27, show a normal profile pattern. Results of the 2nd test, given on August 1, show a decrease in both the amount of work produced and the effect of rest. The evidence indicates that high (and low) temperatures influence the degree of fatigue which in turn affects psychoactivity. Arrangements for suitable rest periods are suggested in order to maintain normal patterns of psychoactivity under high temperatures. (English summary)—*S. Ashida.*

4151. **Meyer, John C.** (State U New York, School of Criminal Justice, Albany) **Police attitudes and performance appraisal: The forest and some trees.** *Journal of Police Science & Administration*, 1973(Jun), Vol 1(2), 201-208.—Investigated the relationship between the employer's appraisal of the employee's performance and the employee's perception of organization morale and client opinion by studying the interaction of these factors in an east coast police department. 833 policemen expressed their views on department morale and public opinion, and an appraisal of each policeman's work was measured by an Index of Recognition (IOR) derived by subtracting the number of complaints regarding a policeman from the number of commendations that he had received. Results appear to indicate that the nature of official recognition has little effect on employee perceptions. However, recognition may reflect the employee's orientation to work as it is measured by the employer. These findings raise the question of whether performance appraisal systems are measuring what they are intended to do.—*R. S. Albin.*

4152. **Nystrom, Paul C.** (U Wisconsin, School of Business Administration, Milwaukee) **Equity theory and career pay: A computer simulation approach.** *Journal of Applied Psychology*, 1973(Apr), Vol 57(2), 125-131.—Used computer simulation to convert E. Jaques's 1961 theory of equitable payment into the composites model utilized by the M. Haire et al's (see PA, Vol 41:14292) study of career pay. Salaries of 100 Ss were stochastically allocated for 25 time periods. A Markovian process model produced a set of pay parameters that more closely replicated past empirical findings than the parameters produced by an independent process model. Distributing pay increases according to differentially

developing work capacity curves yielded pay increases distributed at random with respect to past salaries. Thus, Jaques's theory of equitable payment provides one explanation for the empirical findings generated by previous studies of career pay curves. (22 ref)—*Journal abstract*.

4153. Paloian, A. Y. (Data Enterprises of the Northwest, Bellevue, WA) **An interrogative authoring system.** *International Journal of Man-Machine Studies*, 1974(Jul), Vol 6(4), 421-444.—Reviews requirements for a desirable authoring system and proposes an interrogative authoring system which allows for verb checking prior to entry, logic separation from data, self-documentation of a course, and machine independence of a course (the 1st step toward course sharing). Examples of use of the program are included.

4154. Prediger, Dale J. & Hanson, Gary R. (American Coll Testing Program, Iowa City, IA) **The distinction between sex restrictiveness and sex bias in interest inventories.** *Measurement & Evaluation in Guidance*, 1974(Jul), Vol 7(2), 96-104.—Proposes that sex-limiting or sex-restrictive effects of interest inventories do not necessarily constitute sex-bias and that sex restrictiveness is an important characteristic of interest inventories that should be considered separately from sex bias. Tentative definitions of sex-restrictive and sex-biased reporting procedures are provided and applied to 3 interest inventories for purposes of illustration. The types of evidence these definitions require of publishers are also discussed, and parallels with the Equal Employment Opportunity Commission guidelines on test bias are drawn. It is maintained that unless a distinction between sex-restrictive and sex-biased reporting procedures is made, current definitions of sex bias in interest inventories can and will be successfully challenged by inventory authors, and delays in eliminating biased reporting procedures will result. (15 ref)—*Journal abstract*.

4155. Richardson, Mary S. (New York U) **The dimensions of career and work orientation in college women.** *Journal of Vocational Behavior*, 1974(Aug), Vol 5(1), 161-172.—Administered 14 presumed measures of career orientation as well as Super's Work Values Inventory to 97 female college seniors. Analysis of the relationships among these variables identified 2 relatively independent clusters. The 1st cluster most closely approximated the usual definition of career orientation. Career-oriented women were highly career motivated and perceived the career role as primary in their adult lives. The 2nd cluster—work orientation—characterized women with well-defined occupational aspirations who placed a high value on both the career role and marriage-family responsibilities in their future. Work-oriented women tended to choose traditionally feminine occupations in contrast to the career-oriented women whose aspirations included higher-level and less traditional occupations. (20 ref)—*Journal abstract*.

4156. Rotondi, Thomas. (Marquette U, Robert A. Johnston Coll of Business Administration) **Creativity and organizational identification in research and development environments.** *Public Personnel Management*, 1974(Jan), Vol 3(1), 53-58.—Presents a theoretical discussion of personal identification with an organization as it relates to creative and innovative employees.

Organizational climates may effectively emphasize either creativity or organizational identification, but not both. Creativity is measurable by objective output (U.S. patents, inventions, publications, etc). Organizational identification includes perception of shared characteristics, a feeling of belongingness, and demonstrated support of the organization. 3 generalized expectations of research and development environments are given: (a) Creativity is inversely related to organizational identification. (b) Creativity is directly related to occupational identification. (c) Organization identification is inversely related to occupational identification. It is postulated that there are 2 types of individuals—innovators and ritualists—in research and development organizations. If management provides a flexible work environment conducive to innovation and change, creative individuals are likely to be self-motivated both to achieve organizational goals, and to remain with the organization. (17 ref)—*S. E. Bowser*.

4157. Sainty, Geoffrey E. (Manitoba Community Coll, Canada) **A validation of the worker trait groups in the DOT.** *Journal of Vocational Behavior*, 1974(Aug), Vol 5(1), 173-176.—Performed an empirical validation of the 114 Worker Trait Groups (WTG) of the 3rd edition of the *Dictionary of Occupational Titles* (DOT) by comparing the factor structure of the worker-trait components of the 114 WTG's with the factor structure of 800 jobs. 6 factors were compared and cosines between .8997 and .9657 obtained on the matched factors.

4158. Schiffman, Leon G. & Gaccione, Vincent. (Baruch Coll, City U New York) **Opinion leaders in institutional markets.** *Journal of Marketing*, 1974(Apr), Vol 38(2), 49-53.—Explored opinion leadership in the nursing home industry. A mail questionnaire was sent to the 263 nursing homes in the American Hospital Association, 47% of which responded. Comparison of results of this study with those of household-consumer studies suggests that the institutional opinion leader is similar to his household counterpart in a number of ways. His interaction with administrative personnel of other nursing homes is greater than that of nonleaders, and he is more likely than nonleaders to seek the advice of others. Identification of administrators who are opinion leaders offers 2 advantages: (a) Leaders are more responsive to new products and services. (b) Leaders may serve as sources of information for other purchasers. (16 ref)—*D. W. Twedt*.

4159. Sherman, Lewis J. (U Missouri, St Louis) **A psychological view of women in policing.** *Journal of Police Science & Administration*, 1973(Dec), Vol 1(4), 383-394.—Reviews evidence which supports the thesis that women should be given a broader role in police-work. Examples of this broadened role in the US and foreign countries are presented and discussed.

4160. Singh, N. P. (Bhagalpur U, T.N.B. Coll, India) **Rural or agricultural psychology for developing countries.** *Indian Journal of Psychometry & Education*, 1972(Dec), Vol 3(2), 66-71.—Advocates application of principles and theories of psychology to problems of agrarian economy. The industrial psychology model does not take into account fundamental differences in the personal and situational factors which affect the behavior of agricultural workers. Reinterpretation of such

psychological factors as identification, affiliation, and aggression for agricultural workers is required. Current studies of rural or agricultural psychology are cited. (18 ref)—*J. B. Francis.*

4161. Sudman, Seymour & Ferber, Robert. (U Illinois, Urbana) **A comparison of alternative procedures for collecting consumer expenditure data for frequently purchased products.** *Journal of Marketing Research*, 1974(May), Vol 11(2), 128-135.—Reports a pilot study on alternative means of obtaining consumer expenditure data. Results show that compensation clearly increased both the level of cooperation and expenditures reported, that government vs university auspices do not make much difference, and that diaries yield more complete and accurate information than telephone calls, although telephoning may be useful for supplementary purposes.

4162. Taylor, James W. (California State U, School of Business Administration & Economics, Fullerton) **The role of risk in consumer behavior.** *Journal of Marketing*, 1974(Apr), Vol 38(2), 54-60.—Briefly reviews previous publications on the role of risk in consumer behavior, and presents a proposed model of the interrelationships among the different components of risk-taking in consumer behavior as they affect the purchase decision. (45 ref)

4163. Temkin, Sanford. (Research for Better Schools, Philadelphia, PA) **Making sense of benefit-cost analysis and cost-effectiveness analysis.** *Improving Human Performance*, 1974(Sum), Vol 3(2), 39-48.—Clarifies the meanings and implications of the vocabulary of cost-effective analysis and discusses its effects on individual and leadership decision-making. 2 methods that can be applied to public economic problems—benefit-cost analysis and cost-effective analysis—and the information requirements and implications for applying them are detailed.—*B. McLean.*

4164. Tenzel, James H. & Cizancas, Victor. (U California, Medical School, San Diego) **The uniform experiment.** *Journal of Police Science & Administration*, 1973(Dec), Vol 1(4), 421-424.—Describes a continuing experiment which began in 1969 in which police in Menlo Park, California, switched to standard blazers, dress shirts, and ties, with no insignia, badges, or night sticks. This change has been rapidly accepted, has positively affected police attitudes toward education, and has helped police-community relations.

4165. Tregoe, Benjamin B. (Kepner-Tregoe, Inc, Princeton, NJ) **Job enrichment: How to avoid the pitfalls.** *Personnel Journal*, 1974(Jun), Vol 53(6), 445-449.—Discusses several misconceptions of job enrichment and describes a problem-solving program (Analytical Trouble Shooting) adopted by the author's company.

4166. Tucker, W. T. (U Texas, Coll of Business Administration, Austin) **Future directions in marketing theory.** *Journal of Marketing*, 1974(Apr), Vol 38(2), 30-35.—Reports that marketing theory, which has usually looked at products, institutions, consumers, and marketing practices from the viewpoint of the marketing manager, is now splitting up under the force of its own growing sophistication and the irritation of contemporary problems. Novel approaches which might produce new developments in marketing theory and should therefore be given consideration include study of the labor market

(particularly the human resources it has failed to organize), and research in consumer behavior from the standpoint of the consumer's own well-being or that of society.—*D. W. Twedt.*

4167. Weiss, Carol H. (Columbia U, Bureau of Applied Social Research) **Between the cup and the lip . . . Evaluation**, 1973, Vol 1(2), 49-55.—Studied the effects of specific organizational constraints on program evaluation research. Participants in 10 applied research projects were interviewed. Results indicate that (a) researchers, administrators, and staff often held conflicting views concerning the purpose of evaluation research; (b) researchers were dependent on an administrator for major decisions when he controlled research funds; (c) these 2 factors, as well as differences in professional orientations, were frequently sources of tension and conflict between researchers and administrators; (d) rapid turnover in research staff caused instability in conditions of evaluation; (e) it was difficult to coordinate the timing of evaluation research with program schedules; and (f) often there were no direct channels for providing results of evaluation research to potential users. The implications of these findings for planning program evaluations are discussed.—*J. Adams-Webber.*

4168. Winter, Frederick W. (U Illinois, Urbana-Champaign) **The effect of purchase characteristics on postdecision product reevaluation.** *Journal of Marketing Research*, 1974(May), Vol 11(2), 164-171.—Used a purchase simulation design to study consumer evaluations of products during the period immediately after purchase but before consumption. 490 adults (a) completed attitude and product use questionnaires to determine the importance of 6 attributes of 4 brands of scouring pads, (b) viewed a TV program in which \$s received either an advertising exposure to 1 brand or no exposure, (c) completed a 2nd brand attitude questionnaire, and (d) participated in 4 simulated shopping trips in which they indicated that their purchases of the product were either adoption or trial purchases and completed additional attitude measures. Data indicate that the most favorable cognitive response results from an adoption/trial (vs trial/trial) purchase; the consumer has thus made a recent psychological commitment to a brand previously selected on a trial basis. Favorable cognitive change is increased when the purchase is of a brand of somewhat low superiority over unchosen brands and when the alternatives are viewed as heterogeneous or the chosen brand has high familiarity. Implications for cognitive dissonance theory are discussed. (18 ref)—*L. Gorsey.*

4169. Zytowski, Donald G. (Iowa State U, Student Counseling Service) **Predictive validity of the Kuder Preference Record, Form B, over a 25-year span.** *Measurement & Evaluation in Guidance*, 1974(Jul), Vol 7(2), 122-129.—Located a total of 102 males and females 7(2), 122-129.—Located a total of 102 males and females 25 yrs after they had taken the Kuder Preference Record, Form B (KPR-B) at an average age of 14 yrs. 53% were engaged in occupations consistent with their highest interest scores, although 32% were in occupations consistent with their lowest scores. Those in consistent occupations reported significantly greater job satisfaction, but no difference in self-assessed performance. In addition, \$s whose occupations involved a given scale

scored higher on that scale than those whose occupations did not on all except the Clerical scale, although only on the Social Service scale was the difference significant. Results are interpreted to mean that counseling for future occupations should not be done from the age 14 KPR-Bs, but that interests measured this early do bear a relationship to occupations 25 yrs later. (17 ref)—*Journal abstract*.

### Occupational Guidance & Personnel Selection & Training

4170. Baker, Trace A. & Davis, Joel L. (Northern Illinois U) **A simple turntable for vestibular stimulation of cats by acceleration through a fixed angle with description of a head restraint.** *Behavior Research Methods & Instrumentation*, 1974(Jul), Vol 6(4), 399-402.

4171. Angers, William P. (Kean Coll, NJ) **Position in the family in relation to teaching as a career choice.** *Individual Psychologist*, 1974(May), Vol 11(1), 15-21. —Investigated A. Adler's hypothesis that the oldest child, as an adult, seeks an occupation that places him in authority. Ss were 496 teacher college freshmen whose birth order and temperament qualities were assessed through an author-developed questionnaire and the MMPI, respectively. Results suggest that Adlerian concepts as they relate to birth order and resulting life-style do have validity in the counseling situation. Firstborn siblings tended to gravitate toward schools of professional training as delimited by teacher education in greater proportion than did later-born siblings. Average temperament traits among teacher college students indicated that they were aggressive, dominant individuals who were conscious of the importance of rules and regulations and were willing to do something about these items if they were not satisfied with them. The relationship between Adlerian psychology and achievement, motivation, counseling, and guidance is discussed. (21 ref)—*M. E. Pounsel*.

4172. Austin, David L. (Spin Physics, Inc, San Diego, CA) **Transactional interviewing or, who does what to whom?** *Personnel Journal*, 1974(Jun), Vol 53(6), 450-453. —Discusses goals of the interview, describes special skills necessary for effective interviewing, and reviews specific interviewee goals.

4173. Badalamente, Richard V. et al. (Texas Tech U) **Training police for their social role.** *Journal of Police Science & Administration*, 1973(Dec), Vol 1(4), 440-453. —Presents a systems model for police training in which the social work role of police (output); the traits, knowledge, and skills necessary for this role; and various training methods are discussed. Characteristics of police recruits (input) and performance evaluation (feedback) are briefly mentioned.

4174. Bemis, Stephen E.; Bonner, Robert L.; Kearney, Thomas & Goppold von Lobsdorf, Kathleen. (US Dept of Labor, Washington, DC) **The new occupational aptitude pattern structure for the GATB.** *Vocational Guidance Quarterly*, 1974(Mar), Vol 22(3), 189-194. —Describes the final developmental work and the resulting structure of the new occupational aptitude scales of the General Aptitude Test Battery (GATB). The primary goal was to develop a rationale for relating occupational aptitude patterns to worker trait groups. The new structure is

comprehensive from the standpoint of using available research data because 90% of the specific occupational batteries are included. The structure is limiting, however, from the standpoint of reference to all occupations in the economy. Reports from counselors using the new structure have been favorable.—*R. S. Albin*.

4175. Carroll, Archie B. (U Georgia, Coll of Business Administration) **Conceptual foundations of job enrichment.** *Public Personnel Management*, 1974(Jan), Vol 3(1), 35-38. —Presents a theoretical discussion of job enrichment methodology. The implementation of job enrichment strategies is considered as a special case of introducing change in an organization. A step by step procedure is outlined, consisting of experimentation, supervisory coaching, identification of jobs, implementation, and feedback and follow-up. Job enrichment provides the employee with opportunities for achievement, recognition, responsibility, and mental growth. It is concluded that successful application of this methodology requires continuous managerial commitment.—*S. E. Bowser*.

4176. Christensen, Kathleen C. & Sedlacek, William E. (U Maryland, Counseling Ctr) **Diagnostic use of Holland's Self-Directed Search.** *Vocational Guidance Quarterly*, 1974(Mar), Vol 22(3), 214-217. —Explored the use of the Self-Directed Search for Educational and Vocational Planning (SDS) as a diagnostic tool for identifying students who persist in college when they may be better suited to vocational training programs. The SDS was administered to all entering freshmen at the University of Maryland. One yr later it was administered to 37 freshmen from the same group who had lower than C averages and 37 controls from the original sample. One of the 6 scales ("realistic") differentiated the groups. It is noted that this scale reflects an interest in many occupations which do not require college training. Implications for counselors are discussed.—*R. S. Albin*.

4177. Clarke, Walter V. **Who gains when you cheat on a personality test?** *Personnel Journal*, 1974(Apr), Vol 53(4), 302-303. —Warns against attempts to cheat in taking personality tests for employment. Modern tests are so constructed that cheating is almost impossible. More important, cheating may result in employing the wrong individual in an important position; this is costly for the organization and even more disastrous for the individual. 2 case histories illustrate this kind of mistake.

4178. Dick, Arthur H. (Longines-Wittnauer, New Rochelle, NY) **Job evaluation's role in employee relations.** *Personnel Journal*, 1974(Mar), Vol 53(3), 176-179. —Discusses the importance of communicating the methods of job evaluation to affected members of the organization. 5 such methods are job ranking, grading or job classification, factor comparison, the point method, and direct pricing.

4179. Faverge, Jean M. (Free U Brussels, Belgium) **[L'examen du personnel et l'emploi des tests. (Examination of personnel and the use of tests.)]** (Fren) Paris, France: Presses Universitaires de France, 1972. 176 p.

4180. Fiedler, Fred E. (U Washington, Organizational Research) **Predicting the effects of leadership training and experience from the contingency model: A clarification.** *Journal of Applied Psychology*, 1973(Apr), Vol 57(2),

110-113.—Clarifies some points that the author's article (see PA, Vol 48:7994), which presented a new interpretation of leadership training and experience, did not make sufficiently clear, and corrects the various misinterpretations of the findings as well as of the underlying theory.—*Journal abstract.*

4181. Fisher, Allan H.; Harford, Margi R. & DiSario, Martha R. **Enrollment potential for college-based military officer training programs: A comparison of results conducted in May 1972 and May 1973.** Alexandria, VA: Air Force Human Resources Lab, Manpower Development Branch, MR 74-3, 1974. 102 p.—Survey results show that of the various military training programs the US Air Force and Navy Reserve Officers Training Corps scholarship programs were the most popular with youth and more popular with those from low-income families. Being able to attend the college of choice without financial cost and the term of obligated service were the reasons most often given for affiliating with the military.

4182. Hall, Kathleen M. (Northern Ireland Youth Employment Service Board, Belfast) **What we want from occupational psychology.** *Bulletin of the British Psychological Society*, 1972(Jul), Vol 25(88), 207-209.—Reprints a speech delineating 4 areas in which the occupational psychologist can help the careers officer: (a) in the process of training of personnel for the Youth Employment Service; (b) by greater involvement in career programs in schools, to develop awareness of a wider range of career possibilities and more flexible attitudes toward job status; (c) by helping to encourage young men and women, especially in areas of unemployment, to take advantage of training facilities; and (d) in the area of plans for developing realistic work ideals, job versatility, more knowledge of comparable vocational work in other countries, the use of computers, and helping young people to live with uncertainty.—R. S. Albin.

4183. Hansen, D. N. et al. (Florida State U) **Computer-based adaptive testing models for the Air Force Technical Training Environment Phase I: Development of a computerized measurement system for Air Force technical training.** *US AFHRL Technical Report*, 1974(Jul), No 74-48, 86 p.—Presents a review of the literature on adaptive testing emphasizing methods of test selection and entry, tailored presentations of test items, and sensitive procedures of scoring, diagnosis, interpretation, and reporting. The 2 testing techniques which showed the most promise were flexilevel testing and hierarchical testing. 3 proposed studies, based on previous work done in 2 Air Force technical courses, are described in a validation design for adaptive testing. These studies are a flexilevel test study, a hierarchical learning task adaptive test study, and a criterion zone decision study. It is concluded that adaptive testing offers the potential for time savings of up to 50% and that a very flexible computer system to drive the testing strategies can be easily developed. (7 p ref)—*Journal abstract.*

4184. Hopper, Robert & Williams, Frederick. (U Texas) **Speech characteristics and employability.** *Speech Monographs*, 1973(Nov), Vol 40(4), 296-302.—Conducted a 2-stage pilot study, constructing and testing

semantic differential (SD) scales for interviewers' judgments of employability from taped speech samples. Samples containing responses to interview-type questions were obtained from 4 different ethnic and dialectal speakers, and were played to 12 authentic employment interviewers for judgments on employability of the speakers. Adjectives supplied by the interviewers were incorporated into 40 SD scales of characteristics judged from speech, and a set of employability scales for 7 job categories was devised. 23 new interviewers then responded to the tapes using these test instruments. Factor analysis revealed 4 factors: Competence, Agreeableness, Self-assurance, and Anglo-likeness. Speech-based judgments predicted hiring best for leadership categories, and poorest for manual labor. Stage 2 replicated Stage 1, but with 2 black and 2 white speakers, and fewer scales. The same factors emerged, except for Anglo-likeness. Dialectal differences between speakers affected only executive employability.—C. A. Sherrard.

4185. Jolson, Marvin A. (U Maryland, Coll of Business & Management) **Marketing notes and communications: Employment barriers in marketing.** *Journal of Marketing*, 1974(Apr), Vol 38(2), 67-69.—Prepared 3 résumés identical in educational background and experience, but showing religion/race as (a) white Protestant, (b) black Protestant, and (c) Jew. 300 firms that had advertised marketing positions in the *Wall Street Journal* or *Marketing News* received the 3 résumés. No statistically significant differences in response were found for nonselling marketing positions, but there was a significant tendency for employers to reject black applicants for sales positions. Only 6% of the black sales applicants triggered positive responses, in contrast to 26% of the Jewish and 24% of the white Protestant applicants.—D. W. Twedt.

4186. Kerr, Steven & Harlan, Anne. (Ohio State U) **Predicting the effects of leadership training and experience from the contingency model: Some remaining problems.** *Journal of Applied Psychology*, 1973(Apr), Vol 57(2), 114-117.—F. F. Fiedler's (see PA, Vol 52:Issue 2) clarifying remarks on using the contingency model to predict effects of leadership training and experience have resolved many of the original article's apparent inconsistencies. Some problems still remain, however, which could seriously impair the usefulness of Fiedler's recommendations. Some of these problems and some possible courses of action are discussed.—*Journal abstract.*

4187. Kramer, Howard C. & Barr, Donald J. (Cornell U) **In-service training for campus police.** *Community Mental Health Journal*, 1974(Sum), Vol 10(2), 180-184.—Studied the possible expansion of contributions made by members of a campus security force to the university community. Possible contributions to organizational development provided by college or university security forces are discussed in terms of increasing communication channels; developing skill-building programs to facilitate competence in report writing, listening, or interviewing; and developing ongoing public relations programs to share information with the community. A model for campus security forces inservice training based on results from community involvement programs and

data from a survey of security forces training programs in 18 universities are presented.—*Journal abstract.*

4188. Kuehn, Jane. (Louisiana State U, Junior Div, Baton Rouge) **Group counseling with undecided college students.** *Vocational Guidance Quarterly*, 1974(Mar), Vol 22(3), 232-234.—18 undecided students participated in 2 counseling center groups on career development. The groups met for 3 2-hr sessions in the evening during the spring semester. The format is described together with student gains. It is concluded that a structured group counseling situation for undecided students is most helpful. This group should examine values and decision making, and give information about the world of work.—*R. S. Albin.*

4189. Lohnes, Paul R. (State U New York, Buffalo) **Implications of data-analysis models for careers guidance.** *British Journal of Guidance & Counseling*, 1974(Jul), Vol 2(2), 149-159.—Notes that data-analysis models for careers guidance have been mostly of the regression type, operating to transform trait assessments into predictions of career adjustments. It is suggested that if understanding of self and life-space is a prerequisite to decision-making and planning, models of the correlation type—which transform trait distributions of populations into knowledge of the antecedents of variance in careers phenomena—may need to take precedence in guidance programs. Models of the 2 types have some guidance implications in common, but each type of model also has some special implications, which are discussed. It is argued that studying correlation models for career development data in the context of a sequential, structured guidance curriculum can provide young people with scientific attitudes and skills which will make them ready for personal predictions, decisions, and planning.—*Journal abstract.*

4190. McGoff, R. M. & Harding, F. D. (International Training Consultants, Burbank, CA) **A report on literacy training programs in the armed forces.** Alexandria, VA: Air Force Human Resources Lab, Manpower Development Branch, MR 74-6, 1974. 52 p.—Questionnaire, interview, record search, and observation data indicate wide diversity in methods and effectiveness of the various military literacy training programs (Air Force, Army, and Navy). Procedures for follow-up evaluation are suggested, and it is recommended that literacy training should include job-related skills as well as a specified reading level as program objectives.

4191. Miller, Robert B. (American Inst for Research, Silver Spring, MD) **A method for determining task strategies.** *US AFHRL Technical Report*, 1974(May), No. 74-26, 50 p.—Examines the concept of strategic principles or task strategies implicit in the job activities of highly proficient performers. The goal is to identify or invent such strategies, as appropriate, and then train workers to use them. 25 information processing functions are described, with examples of strategic principles and training implications. Certain other strategic principles not readily interpretable in information processing terms are also presented. An analytic procedure for determining and/or devising strategies is provided and suggestions on the teaching and learning of strategies are summarized.—*Journal abstract.*

4192. Morley, Eileen. (Harvard U, Graduate School of Business Administration) **Human support services in complex manufacturing organizations: A special case of differentiation.** *Administrative Science Quarterly*, 1974(Sep), Vol 19(3), 295-318.—Studied the distribution of services provided by 8 large manufacturing companies to encourage individual success at work. Data were obtained from 25 senior executives in the firms. Organizational profile data reveal 4 types of employing organizations in the sample, each employing a different type of population, and supplying a different level of service. Findings show that the level of human support services provided is not related to employee characteristics but to certain system variables, suggesting that services occur in response to system characteristics rather than to worker needs. The existence of a "third world" effect in the socioeconomic distribution of industrial populations is suggested (i.e., people with the most acute problems work in organizations that provide the least service). (18 ref)—*Journal abstract.*

4193. Mullins, Cecil J. & Massey, Iris H. (Air Force Human Resources Lab, Selection Systems Section, Lackland Air Force Base, TX) **An evaluation of item-by-item test administration.** *Journal of Applied Psychology*, 1973(Apr), Vol 57(2), 188-189.—Administered a battery of 3 tests to 2 groups of 615 airmen in their 1st wk of basic training. One group was tested in the normal way, and the other was tested with an item-by-item form of administration. Results indicate that the item-by-item administration was in no way superior to the usual method.—*Journal abstract.*

4194. Parker, Randall. (U Texas, Austin) **Methodological pitfalls in predicting counseling success.** *Journal of Vocational Behavior*, 1974(Aug), Vol 5(1), 31-39.—Compared prediction models employing multiple linear regression of raw scores, multiple linear regression of factor scores, the single best predictor, and a 9-point decision rule index, using data from 296 counseling clients. The least statistically sophisticated model, employing the single best predictor, was the most successful approach. Considerable shrinkage in power of prediction was demonstrated upon cross-validation.

4195. Rigney, Joseph W.; Morrison, D. Kirk & Williams, Louis A. (U Southern California) **A guide for the application of performance-structure oriented CAI in naval training: A working paper.** *NAVTRAEQUIP-CEN: USN Training Equipment Center Technical Report*, 1974(Jul), No 73-C-0065-1, 62 p.—Describes considerations and procedures for applying Performance-Structure Oriented computer-assisted instruction (CAI) in naval training in terms of a general diagram of the necessary elements in a CAI system. The developmental steps, from job task-structure analyses to computer programs, are described. (3½ p ref)

4196. Rigney, Joseph W.; Towne, Douglas M. & King, Carole A. (U Southern California, Behavioral Technology Lab, Los Angeles) **Interactive computer graphics for performance-structure-oriented CAI.** *Behavioral Technology Laboratories, U Southern California, Technical Report*, 1974(Jul), No 73, 30 p.—Describes 2 different uses of interactive graphics in computer-assisted instruction (CAI)—as substitutes for physical devices and operations (e.g., simulation of operating on man-ma-

chine interfaces by using the graphics for controls, indicators, and indications) and as explications of invisible processes (e.g., graphics which allow students to initiate animations of physical processes or functional organizations).

4197. Rust, Steven K.; Smith, James F. & Woodruff, Robert R. **Syllabus and syllabus development techniques used in evaluating the A/F37A/T-4G flight simulator.** *US AFHRL Technical Report*, 1974(Jun), No 74-44, 35 p.—Describes the simulator syllabus developed by the Flying Training Division of the US Air Force Human Resources Laboratory to demonstrate the effectiveness of a limited visual, limited motion flight simulator in T-37 undergraduate pilot training. This report (a) describes the syllabus development procedures employed; (b) clarifies the resulting syllabus content and format; and (c) provides a guide for development of future special purpose syllabi.—*Journal abstract*.

4198. Schneider, Craig E. (U Colorado, Coll of Business & Administration) **Training and development programs: What learning theory and research have to offer.** *Personnel Journal*, 1974(Apr), Vol 53(4), 288-293.—Summarizes learning principles and findings, potentially useful in all phases of training and development programs, which are grouped as follows: (a) learning environment, (b) the role of the teacher/trainer, (c) characteristics of the learner, (d) basic processes in human learning activity, (e) reinforcement and punishment, (f) retention and transfer of learning, and (g) effects of practice.—*P. L. Crawford*.

4199. Serednesky, George E.; Cahill, Lorine & Engelhart, Charles I. (Woodside Receiving Hosp, Youngstown, OH) **Effectiveness of the GATB and counseling combined: Reducing vocational training dropout rates.** *Journal of Employment Counseling*, 1974(Mar), Vol 11(1), 10-12.—Assigned 73 16-22 yr old male vocational trainees to 1 of 2 groups. The 36 Ss in Group 1 were assigned to a particular vocational course consistent with their General Aptitude Test Battery profiles and received 3 or more counseling sessions. The 37 Ss in Group 2 received neither prescreening nor counseling sessions but were assigned to their courses because of personal interest and in order to fill vacancies. A significant relationship ( $p < .01$ ) was found between the combination preparation procedures (prescreening and counseling) and graduation from the vocational course. Further analysis suggests that the combination of counseling and prescreening may reduce dropout rate to a greater extent than prescreening alone.—*Journal abstract*.

4200. Sinha, A. K. (Ministry of Defence, New Delhi, India) **Increasing effectiveness of human potentialities.** *Indian Journal of Psychometry & Education*, 1972(Dec), Vol 3(2), 53-58.—Discusses the social importance of vocational guidance, personnel selection, and occupational training for achieving effective symbiosis of man and machine in industry. It is concluded that in India, vocational guidance geared to industrial and social needs is very primitive, personnel selection procedures employing psychological assessment procedures are not far advanced, and occupational training programs based upon the resources and demands of technology are

almost nonexistent. There is need for increased research in specific aspects of all these areas.—*J. B. Francis*.

4201. Teasley, C. E. & Wright, Leonard. (U South Carolina, Bureau of Governmental Research & Service) **The effects of training on police recruit attitudes.** *Journal of Police Science & Administration*, 1973(Jun), Vol 1(2), 241-248.—Tested 48 state patrol recruits at the beginning and end of their 8-wk training course to determine what attitudinal changes in conservatism and dogmatism the course might have caused. Conservatism was measured on a scale of 26 Likert-type items, and dogmatism was measured on Rokeach's E scale. Conservatism increased moderately during training, and dogmatism increased to a more marked degree. Of the 3 major functions of the police—law enforcement, peacekeeping, and the provision of services—the first is the most strongly emphasized in police training, yet in practice the police spend much less time in actual law enforcement than in peacekeeping activities and the provision of services, functions which call for less authoritarian behavior than law enforcement. The appropriateness of police academy training, as now carried out, is questioned.—*R. S. Albin*.

4202. Thomas, Charles A. (US Dept of the Army, Office of the Surgeon General, Washington, DC) **Human relations training in the army medical department.** *Military Medicine*, 1974(Sep), Vol 139(9), 731-733.—Describes the evolving integration of human relations training principles into the Army Medical Department's mental health and behavioral science programs. Particular emphasis is given to how these principles contribute to an emerging broader view of mental health that incorporates social and environmental factors as contributing variables. Present human relations training activities are described, and the future utilization and importance of this approach is discussed.—*Journal summary*.

4203. Thursby, Lynn L. **The WIN Program: Its success with female trainees.** *Journal of Employment Counseling*, 1974(Mar), Vol 11(1), 13-15.—Examined the effectiveness of the Work Incentives (WIN) Program with 28 female trainees in a medium-sized midwestern city. A questionnaire, which included the Michigan State University Work Beliefs Checklist, investigated 23 hypotheses, specifically focusing on the hypothesis that WIN enrollees successfully placed in jobs would not differ substantially from other enrollees in work history. This hypothesis was rejected: length of work history differed substantially between successful and less successful WIN trainees. Demographic variables of female WIN enrollees are analyzed, and ways in which WIN counselors might profit from a knowledge of these variables are discussed.—*B. McLean*.

4204. Varga, Lou. (California Dept of Human Resources Development, San Diego) **Counseling outcomes: Counselor characteristics and client results.** *Journal of Employment Counseling*, 1974(Mar), Vol 11(1), 2-9.—Studied 18 counselors in one of the administrative areas of the California Department of Human Resources and 697 of their closed cases in order to discover whether differences in employability outcomes did exist. The study attempted to discover (a) the number of clients who achieve employability during their relationships

with employment counselors, (b) the final disposition of cases that are closed other than employable, and (c) the degree to which counselors engage in placement activities and the influence which these activities have on employable closures. Results provide evidence that some counselors had significantly more clients achieve employable status than did other counselors.—*Journal abstract.*

4205. Wittmer, Joe; Jeffers, Martin S. & Persons, William E. (U Florida) **Parental behavior and vocational choice: A comparison of counselors and engineers.** *Journal of Employment Counseling*, 1974(Mar), Vol 11(1), 16-21.—Compared the perceived parental behavior characteristics of 41 counselors in training and 33 5th-yr engineering students in a test of a part of A. Roe's (see PA, Vol 33:1546) vocational choice theory. This theory suggests a dichotomous pattern of vocational choice: "toward persons" (e.g., counseling) or "toward nonpersons" (e.g., engineering) categories that will have been determined by the nature of the early childhood socialization process. In essence, a person who has experienced a warm loving home situation is more likely to enter a "toward persons" occupation, and an individual whose parent-child relationship was emotionally cold will most likely gravitate toward a "toward nonpersons" occupation. Both groups were administered the Parent-Child Relations Questionnaire developed by Roe and M. Siegelman (1963). The findings lend considerable support to Roe's theory.—*Journal abstract.*

#### Job Performance & Satisfaction

4206. Azen, Stanley P.; Snibbe, Homa M. & Montgomery, Hugh R. (U Southern California, School of Engineering) **A longitudinal predictive study of success and performance of law enforcement officers.** *Journal of Applied Psychology*, 1973(Apr), Vol 57(2), 190-192.—Describes a 20-yr longitudinal study of biographical, psychological, and aptitudinal variables predictive of successful police performance. Ss were 95 men appointed as deputy sheriffs in the Los Angeles County Sheriff's Department between 1947 and 1950. Among the significant predictors, stepwise-discriminant analysis yielded the following as "best" predictors of at least 1 criterion of success: age, height, the civil service written test score, the Hypomania scale of the MMPI, the Mechanical scale of the Kuder Vocational Preference Record, and the Activity scale of the Guilford-Zimmerman Temperament Survey.—*Journal abstract.*

4207. Bass, Alan R. & Turner, John N. (Wayne State U) **Ethnic group differences in relationships among criteria of job performance.** *Journal of Applied Psychology*, 1973(Apr), Vol 57(2), 101-109.—Investigated racial discrimination and differential bias in criterion measures for 75 black and 359 white tellers in a large bank. 6 supervisory ratings and 4 objective criteria (adjusted salary increase, percent of time worked, and number of shortages and averages) were obtained. Results indicate that mean differences between black and white employees on the criterion measures were generally small, and most statistically significant differences were reduced to nonsignificance when the effects of age and job tenure were removed. However, further analyses showed that the white supervisors based their evaluations of subordi-

nates on objective data for black employees considerably more than they did for white employees. (19 ref)—*Journal abstract.*

4208. Borman, Walter C. (Personnel Decisions, Minneapolis, MN) **The rating of individuals in organizations: An alternate approach.** *Organizational Behavior & Human Performance*, 1974(Aug), Vol 12(1), 105-124.—Notes that in assessing validity of performance ratings, high agreement between raters may be an unduly severe and erroneous requirement. Instead of demanding convergent validity across organizational levels on performance dimensions common to the different levels, it is suggested that the raters be subgrouped by organizational level with each rater group providing performance evaluations using only dimensions appropriate to their level's position. To test this idea, scaled expectation behavior rating scales were developed separately by 41 secretaries and by university instructors for the job of secretary. The 4 job behavior dimensions (Job Knowledge, Organization, Cooperation with Co-workers, and Responsibility) developed by secretary raters showed only modest conceptual similarity with the 3 job behavior dimensions (Judgment, Technical Competence, and Conscientiousness) developed by instructors. Within-level interrater agreement for instructor rates was greater on their own dimensions than on the secretaries' dimensions ( $p < .005$ ), and for secretary raters interrater agreement was greater for their own dimensions ( $p < .10$ ). A hybrid multitrait-multirater analysis in which raters make evaluations on only those dimensions their level's members are in good position to rate is offered as a more reasonable method to judge the "goodness" of ratings in organizations. (16 ref)—*Journal abstract.*

4209. Bozza, Charles M. (California State U, Long Beach) **Motivations guiding policemen in the arrest process.** *Journal of Police Science & Administration*, 1973(Dec), Vol 1(4), 468-476.—Tested the widely held belief that younger police officers with higher educational levels and less experience will make a greater number of arrests. 24 officers were divided into high and low groups based on their arrest records. The high performance group was significantly younger and more educated, but they did not differ either in their tolerance level (measured by the Conventionalism subscale of the California F Scale), in their attitudes toward promotion (measured by the Job Descriptive Inventory), or in their length of service. Possible reasons why older officers with less education make fewer arrests are discussed.—R. J. Albers.

4210. Chatterjee, Amitava. (Indian Inst of Technology, Kharagpur, India) **The organizational variables of group cohesiveness.** *Indian Journal of Psychometry & Education*, 1972(Dec), Vol 3(2), 43-52.—Investigated the relationship between group cohesiveness and organizational factors. 200 workers organized in section units as primary work groups completed questionnaires dealing with attitudes toward those groups. An index of group cohesiveness (defined as satisfaction with one's work group) was calculated and compared with organizational factors (e.g., productivity, size of work group, length of service, satisfaction with supervision, and satisfaction with managers). Data indicate that group cohesiveness

was positively related to length of service in the organization, satisfaction with supervision, satisfaction with management, and productivity, but was negatively related to size of work group. Results suggest that group cohesiveness may be a significant factor in effective management.—J. B. Francis.

4211. de Leo, Philip J. & Pritchard, Robert D. (US Air Force Human Resources Lab, Lowry Air Force Base, CO) **An examination of some methodological problems in testing expectancy-valence models with survey techniques.** *Organizational Behavior & Human Performance*, 1974(Aug), Vol 12(1), 143-148.—Examined the reliability and construct validity of various questionnaire measures of expectancy-valence components. Measures of valence, instrumentality, and expectancy were given to a sample of 171 male US Air Force trainees on 2 occasions. Results indicate that reliabilities of the 3 components of the model were fairly low and that different measures of the same component were not highly correlated. It is concluded that using questionnaire measures to test expectancy-valence models is inappropriate until better measures are developed.—*Journal abstract.*

4212. Helmreich, Robert; Bakeman, Roger & Radloff, Roland. (U Texas, Austin) **The Life History Questionnaire as a predictor of performance in Navy diver training.** *Journal of Applied Psychology*, 1973(Apr), Vol 57(2), 148-153.—Describes a new demographic instrument, the Life History Questionnaire (LHQ), which elicits demographic data longitudinally by providing a question-by-year matrix of responses. Variables derived from the LHQ were used to predict success in US Navy diver training. Validation and cross-validation data were obtained from 115 enlisted men in 5 diving classes. 2 criteria were developed for the samples—pass-fail indicator and a 4-point performance criterion. Correlational data for 12 predictors (e.g., social status, health, and educational performance) are presented. The LHQ appears to provide sufficient longitudinal data to enable detailed investigation of relationships among a variety of life settings and experiences and to relate these to subsequent behavior. (16 ref)—L. Gorsey.

4213. Herman, Jeanne B. & Hulin, Charles L. (U Illinois) **Managerial satisfactions and organizational roles: An investigation of Porter's Need Deficiency Scales.** *Journal of Applied Psychology*, 1973(Apr), Vol 57(2), 118-124.—Empirical research identifying a relationship between job satisfaction and level in the organizational hierarchy has utilized the Porter Need Satisfaction Questionnaire extensively. An attempt was made to replicate the previous findings and expand the domain of job satisfaction variables to determine the generality of the relationship. Ss were 174 supervisors in a large manufacturing firm. The hypothesis of different mean levels of satisfaction associated with different levels in the hierarchy was supported using the Job Descriptive Index (JDI), but was not supported using the Porter Need Deficiency Scales. The internal structure of the Porter Questionnaire and its convergence with the JDI were investigated to explore alternative explanations of the results. (18 ref)—*Journal abstract.*

4214. Hill, John W. & Eddowes, Edward E. **Further development of automated GAT-1 performance**

**measures.** *US AFHRL Technical Report*, 1974(May), No 73-72, 80 p.—Describes a search for automated flight measurements that correlate with pilot proficiency. 2 separate experiments were carried out in a GAT-1 trainer: a basic experiment with 326 measurements on each of 30 Ss in 3 experience groups, and an expanded experiment with 2,436 measurements on each of 30 new Ss from the same 3 experience groups. Exp I consisted of 4 different flight tasks, each about 10 min long, and Exp II consisted of these and 6 additional tasks. Results show that there was little difficulty in obtaining measurements that correlated with experience. More than 5% of the measurements of each experiment were statistically significant ( $p < .01$ ). Over 400 important measurements were tabulated with group means, standard deviations, and further cross-tabulations to show which tasks and families of measurements were best at discriminating among pilots. 3 statistical methods were used to select a set of measurements from Exp I and combine them into 2 new canonical variables, each a linear-weighted combination of the measurements in the set, to discriminate optimally among the 3 groups of Ss. Applying the canonical variables to the repeated measurements of Exp II allowed several deductions about the best selection procedure to be made.—*Journal abstract.*

4215. Kapor, Gojko; Vujošević, Krsto & Branković, Miodrag. (Military Medical Academy, Clinic for Mental Disease, Belgrade, Yugoslavia) **[Sociomedical factors influencing resignations from the army.]** (Srce) *Vojnosanitetski Pregled*, 1974(Mar), Vol 31(2), 79-83.—Compared 182 soldiers who resigned from the army and 100 control soldiers with respect to medical, social, and psychosocial variables. Those who resigned showed a greater incidence of psychoneurotic and psychopathic disorders, were less often employed or highly skilled, more often had parents with alcoholic, psychopathic, and marital problems, were more often firstborn or only children, and had committed a greater number of criminal offenses prior to military service than soldiers in the control group. (English, French & Russian summaries)—S. Slak.

4216. Knowles, Patrick & Peterson, Rolf. (US Coast Guard Recruit Training Ctr, Cape May, NJ) **Measurement of flexibility in state police officers.** *Journal of Police Science & Administration*, 1973(Jun), Vol 1(2), 219-223.—Analyzed 2-part questionnaires returned by 23 of the 60 members of a state police tollway battalion, to obtain data on the relation between personal and environmental variables and the flexibility of police in situations allowing or requiring discretionary action. Part 1 of the questionnaire elicited personal characteristics. Part 2 described 5 incidents with more than one solution, and respondents were asked to state in writing how they would handle the situation. 21-29 yr old officers were more flexible than those 30-50 yrs old, and those classified as extraverts were more flexible than introverts. The Social Distance variable, which measured the respondent's acceptance of "different" individuals, was also a good indicator of flexibility. A relationship between flexibility and higher education was not confirmed, perhaps because only 3 Ss had college degrees. It is felt that situational testing is superior to routine tests, and it is recommended that similar studies

of police recruits be carried out and the results compared with the recruits' later records to determine the predictive value of the questionnaire.—R. S. Albin.

4217. Lewis, Rodney W. **Toward an understanding of police anomie.** *Journal of Police Science & Administration*, 1973(Dec), Vol 1(4), 484-490.—Rejects the view that police anomie arises from professionalization in favor of a "danger-stress" view. Danger-stress produces the anomie which is in turn compounded by other outside factors, including professionalism.

4218. Muchinsky, Paul M. & Hoyt, Donald P. (Iowa State U) **Predicting vocational performance of engineers from selected vocational interest, personality, and scholastic aptitude variables.** *Journal of Vocational Behavior*, 1974(Aug), Vol 5(1), 115-123.—Examined the validity of the American Council on Education Psychological Examination Quantitative score and of selected subscales of the Edwards Personal Preference Schedule and the Strong Vocational Interest Blank (SVIB) in predicting the vocational performance of 217 engineers. Multidimensional criteria of vocational performance assessed from both external and internal frames of reference were employed. 6 predictors were related to 17 vocational performance criteria; of the 102 tests that were made, 7 were statistically significant. Results indicate that vocational performance cannot be accurately predicted by vocational interest, personality, and scholastic aptitude variables. The only consistent finding was that subjective ratings of vocational performance were predicted by SVIB Group V scores. (17 ref)—*Journal abstract.*

4219. O'Reilly, Charles A.; Bretton, Gene E. & Roberts, Karlene H. (U California, Berkeley) **Professional employees' preference for upward mobility: An extension.** *Journal of Vocational Behavior*, 1974(Aug), Vol 5(1), 139-145.—In a recent article D. Harlow (1973) provided some empirical data regarding the upward mobility aspirations of professional employees. In partial support of R. Presthus's accommodation theory (1962) Harlow found a positive correlation between preference for promotion (PP) and job satisfaction (JS). She also reported conflicting findings relating ambiguity tolerance (AT) and PP. The results reported here, from a study with 252 officers and enlisted military aviation personnel, test the 2 hypotheses Harlow investigated and a 3rd hypothesis, suggested by Presthus, relating organizational commitment (OC) and PP. The analyses confirmed Harlow's findings concerned with the relationship between PP and JS, failed to find any relationship between AT and PP, and showed a positive association between OC and PP.—*Journal abstract.*

4220. Ronan, W. W. et al. (Georgia Inst of Technology) **Occupational level and mental health: A note.** *Journal of Vocational Behavior*, 1974(Aug), Vol 5(1), 157-160.—Administered A. Kornhauser's (1965) questionnaire to 75 military and 25 civilian personnel at 3 military installations. Analysis of the data showed the existence of at least 6 factors concerned with personal life adjustment. There was a failure to find any substantial relationship between mental health and job satisfaction, which confirms a finding by the Survey Research Center study (1970). It is hypothesized that the relationship between mental health and job satisfaction

exists only on the lower skill, routine work level. It is further suggested that these research results offer certain directions that might be pursued in the further understanding of the exact bases for both job and general life adjustment.—*Journal abstract.*

4221. Schwab, Donald P. (U Wisconsin, Madison) **Conflicting impacts of pay on employee motivation and satisfaction.** *Personnel Journal*, 1974(Mar), Vol 53(3), 196-200.—Studied responses of approximately 300 skilled and semiskilled male and female employees, drawn from a work force of 4,000 in plants in the US and Canada, who responded to the Minnesota Satisfaction Questionnaire and the Job Description Index. 3 pay systems were used: individual piece rates ( $n = 128$ ), group incentive rates ( $n = 84$ ), and hourly rates ( $n = 61$ ). Results indicate that persons paid by time were most satisfied with their pay while persons paid on output were more highly motivated to perform ( $p < .05$ ). Thus a personnel practice (in this instance, the type of pay system) may have a positive effect on motivation but a negative effect on satisfaction. The implications of this finding for the personnel manager's job are discussed. (28 ref)—P. L. Crawford.

4222. Shirom, Arie & Goldberg, Joel. (Tel-Aviv U, Israel) **Adjusting to work: Workplace mobility of young male workers in Israel.** *Journal of Vocational Behavior*, 1974(Aug), Vol 5(1), 67-77.—Examined the correlates of workplace mobility in 15-17 yr old male Israeli workers registered with the Youth Employment Bureau (YEB). Data regarding these correlates, and longitudinal data concerning the sequence of job movements, were obtained in an interview held with a sample of those youths who resided in Tel-Aviv ( $n = 146$ ) and from the YEB's forms filled out in connection with their registration and job placements. Several measures of sociodemographic background, past work experience, and present working conditions were included in the multiple correlation analysis. Controlling for longevity in the labor force, seniority in the 1st job emerged as the most efficient predictor of workplace mobility. Results suggest that the early stages of a young worker's process of occupational socialization are important in determining his future career decisions. (23 ref)—*Journal abstract.*

4223. von Grumbkow, J. & Wilke, H. (Inst of Social & Industrial Psychology, Groningen, Netherlands) **[Social exchange and equity: Testing and appraisal of the equity theory.]** (Duth) *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1974(Jun), Vol 29(4), 281-316.—Applies J. S. Adams's equity theory to employee performance. The theory interprets social behavior as an exchange process; it is based on classical learning concepts, and on the principles of frequency and reinforcement as conditioned by the law of effect. L. Festinger's dissonance theory is applied to indicate the reduction of tension as a source of motivation. In a simple direct exchange the equity formula is expressed as a ratio of income of an employee, A, divided by his expenses, compared to the same ratio for another employee, B, like him. The indirect exchange situation involves many more conditions which obscure the application of the Adams theory. Some of these conditions are the behaviors and goals of the employer, C. Many factors in the A-B-C triad are discussed, such as

the personal needs and conflicts of the employees, reactions to corrections by the employer, the wage system, communications among the workers, knowledge of the wages of others, and employees' future plans. Other competing and conflicting theoretical ideas are discussed. (English summary) (92 ref)—*A. J. Ter Keurst*.

4224. **Ward, Ernest H.** (Honeywell Information Systems, Los Angeles, CA) **Elements of an employee motivation program.** *Personnel Journal*, 1974(Mar), Vol 53(3), 205-208.—Discusses employee motivation in an industrial environment; i.e., what can be done, in practical terms, to bring about more widespread acceptance by employees of organizational goals, and a greater desire to work towards them.

### Management & Leadership

4225. **Epstein, Jack H.** (US Air Force Systems Command, Andrews Air Force Base, Washington, DC) **Career management programs.** *Personnel Journal*, 1974(Mar), Vol 53(3), 191-195.—Questions the validity of the development concept that all employees need to be developed in the same way. Evidence indicates that the programs are not producing the results claimed.

4226. **Guthrie, Thomas L.; Peterson, Robert N. & Leonard, Edwin C.** (Indiana U, Fort Wayne) **The remuneration riddle.** *Personnel Journal*, 1974(Apr), Vol 53(4), 253-257.—Discusses the question of how much to pay salaried employees and the various factors affecting the answer. It is suggested that computer resources using linear programming with an appropriate algorithm procedure can establish a compensation program that is objective, fair, and relatively easy to administer.

4227. **Haynes, Marion E.** (Shell Oil Co, Houston, TX) **Delegation: Key to involvement.** *Personnel Journal*, 1974(Jun), Vol 53(6), 454-456.—Discusses principles of delegation and offers suggestions for maximizing its effectiveness.

4228. **Hogenraad, Robert; Mertens, Charles; Goddin, Michel & Roland, Emile.** (U Louvain, Belgium) **[Affective and descriptive structures of management: Inter-cultural study.]** (Fren) *International Journal of Psychology*, 1973, Vol 8(4), 275-283.—Obtained responses to a semantic differential instrument, composed of 22 concepts and 30 bipolar adjective scales (9 pancultural and 21 from the management field) from 50 Canadian and 48 Belgian Ss, all French-speaking male managers and nonmanagers, who worked in 2 production enterprises in Quebec, Canada, and in Belgium. Factor analysis revealed Control as the 1 management-specific factor common to both samples, with Precision and Creativity also appearing, in a less striking manner, for both groups. Control as it dominates managerial thinking, rather than the usual semantic differential structure, may have important implications. (English summary)—*E. A. Gavin*.

4229. **Hrebiniak, Lawrence G.** (Pennsylvania State U, Coll of Business Administration) **Job technology, supervision, and work-group structure.** *Administrative Science Quarterly*, 1974(Sep), Vol 19(3), 395-410.—Based on data from 36 supervisors and 174 subordinates in a general hospital and measures of technological level, task predictability, interdependence, and manageability, job autonomy, participation, and supervision variables (e.g.,

unity and closeness of control), it is suggested that the relationship between technology and structure at the individual level is too weak to indicate a technological imperative, even when prior socialization and background of the respondents are controlled. At the group level of analysis, variables such as the perceived hierarchical independence and decisional participation of the supervisor were significantly related to structure, independent of job technology. With the effects of supervision taken into account, job technology and work-group structure showed significant relationships. Results of multivariate analysis indicate the importance of both technology and supervision for work-group structure. Data suggest that a number of variables account for structure in organizations where control is fragmented. (48 ref)—*Journal abstract*.

4230. **Kerr, Steven; Schriesheim, Chester A.; Murphy, Charles J. & Stogdill, Ralph M.** (Ohio State U) **Toward a contingency theory of leadership based upon the consideration and initiating structure literature.** *Organizational Behavior & Human Performance*, 1974(Aug), Vol 12(1), 62-82.—Reviews the published literature involving the leader behavior dimensions "consideration" and "initiating structure," to develop some situational propositions of leader effectiveness. Among the variables found by researchers to significantly moderate relationships between leader behavior predictors and satisfaction and performance criteria are the following: subordinate need for information, job level, subordinate expectations of leader behavior, perceived organizational independence, leader's similarity of attitudes and behavior to managerial style of higher management, leader upward influence, and characteristics of the task (including pressure and provision of intrinsic satisfaction). 10 situational propositions are presented, and these are linked to form 2 general postulates of leadership effectiveness. (4½ p ref)—*Journal abstract*.

4231. **McDonnell, John F.** (California State Coll, San Bernardino) **The human element in decision making.** *Personnel Journal*, 1974(Mar), Vol 53(3), 188-190.—Sees the decision maker as acting subjectively, on the basis of his own standards, his sense of obligation to his superiors, etc. It is suggested that each problem should be approached individually rather than by following set rules.

4232. **Mobley, William H.** (U South Carolina, Coll of Business Administration) **The link between MBO and merit compensation.** *Personnel Journal*, 1974(Jun), Vol 53(6), 423-427.—Notes the wide divergence of opinion on the value of linking Management by Objectives (MBO) and merit compensation activities. 625 middle- to top-level managers of a large corporation, who had been using the MBO process for an average of 2 yrs, were asked to indicate their perceptions of the relationship. Most respondents perceived a positive value in the relationship.—*P. L. Crawford*.

4233. **Ouchi, William G. & Dowling, John B.** (Stanford U) **Defining the span of control.** *Administrative Science Quarterly*, 1974(Sep), Vol 19(3), 357-365.—Considers that the concept span of control has been interpreted so widely over the past years that in its present form its use as a means of communicating information among scholars has become severely impaired. It is argued that

it is a useful concept for measuring the closeness of contact between a superior and his subordinates. Data from department managers and salespersons in 78 retail department stores are presented which demonstrate that different operational definitions of the term will produce not only greatly different mean values of the span of control, but also different correlation coefficients with other important structural variables (e.g., size, intradepartmental homogeneity, and store image). A new operational measure is proposed to develop a common language of measurement that will facilitate an understanding of organizational structure. (16 ref)—*Journal abstract*.

4234. Reid, Thomas J. (Grumman Aerospace Corp, Bethpage, NY) **The context of management development.** *Personnel Journal*, 1974(Apr), Vol 53(4), 280-287.—Discusses the function of management development in general conceptual terms as a component of some larger system which it attempts to serve. It is emphasized that the formulation of plans and implementation of programs to develop managers for a particular organization must be preceded by the development of an understanding of the organization as an entity and the organizational expectations concerning manager behavior and performance.—P. L. Crawford.

4235. Robertson, Dan H. (U Denver, Coll of Business Administration) **Sales force feedback on competitors' activities.** *Journal of Marketing*, 1974(Apr), Vol 38(2), 69-71.—Conducted a study to determine the extent of feedback from the sales force about the introduction of new products by competitors. It was found that even in a corporation where the importance of receiving competitive information is stressed, only rarely (less than 20% of the time) is this information transmitted back to management. Follow-up interviews revealed that many salesmen felt the information would not be used, and that because of the numerous other nonselling demands on a salesman's time (travel, other paper work, waiting to see customers, etc) management should not overemphasize time devoted to selling at the cost of activities such as sales force feedback.—D. W. Twedt.

4236. Scheil, Virginia E. (Metropolitan Life Insurance Co, Personnel Research, New York, NY) **The relationship between sex role stereotypes and requisite management characteristics.** *Journal of Applied Psychology*, 1973(Apr), Vol 57(2), 95-100.—300 24-64 yr old male middle managers rated either women in general, men in general, or successful middle managers on 92 descriptive terms. Results confirm the hypothesis that successful middle managers are perceived to possess characteristics, attitudes, and temperaments more commonly ascribed to men in general than to women in general. There was a significant resemblance between the mean ratings of men and managers, whereas there was no resemblance between women and managers. Examination of mean rating differences among women, men, and managers on each of the items disclosed some requisite management characteristics which were not synonymous with the masculine sex-role stereotype. Implications of the demonstrated relationship for organizational behaviors are discussed. (22 ref)—*Journal abstract*.

4237. Sheibar, Paul. (First National City Bank, New York, NY) **Personnel practices review: A personnel**

**audit activity.** *Personnel Journal*, 1974(Mar), Vol 53(3), 211-215, 217.—Describes a personnel audit system used in a large bank which includes securing information about (a) deviations from personnel policy and the need for corrective action at the operating level, (b) the need for changes in personnel policies, (c) the need for new policies, and (d) employee reaction to personnel policies and work environment. The focus is on the detailed method of analyzing the extent to which supervisors comply with personnel policies and practices, and to assist when necessary.—*Journal abstract*.

4238. Truskie, Stanley D. (U Pittsburgh) **A case study of a union-management learning encounter in industry.** *Personnel Journal*, 1974(Apr), Vol 53(4), 277-279.—Describes a program that has been successfully implemented and has been made part of a 3-yr union contract. It is concluded that union and management personnel can join in extensive learning experiences to discuss substantive, job-related issues to their mutual benefit.

4239. Turner, Ronald E. (Queen's U, Kingston, Ontario, Canada) **Product priorities within a multiple-product marketing organization.** *Journal of Marketing Research*, 1974(May), Vol 11(2), 143-150.—Explored the problems experienced by management in allocating marketing funds in multiple-product companies using normative analysis. Data from this type of company during 1 yr of operations confirm the predicted directions of product-priority influence between product managers, salesmen, and other managerial roles and suggest that their perceptions change over time and as a result of exposure to different stimuli. (20 ref)

4240. Van Fleet, David D. (U Akron) **Toward identifying critical elements in a behavioral description of leadership.** *Public Personnel Management*, 1974(Jan), Vol 3(1), 70-82.—Considers a major problem in studies of leadership and managerial effectiveness; i.e., the lack of an operational definition. The critical incident technique was employed in an attempt to develop such a definition. The study involved nearly 50 Ss from more than 25 organizations, and consisted of collecting, condensing, testing for criticality, and categorizing a fairly large number of such incidents. A Behavioral Description of Leadership was developed from the data. While this does not represent the perfect definition of leadership that is being sought, it is felt to be one more step toward such a definition. (29 ref)—S. E. Bowser.

### Organizational Structure & Climate

4241. Hunt, Shelby D. & Nevin, John R. (U Wisconsin) **Power in a channel of distribution: Sources and consequences.** *Journal of Marketing Research*, 1974(May), Vol 11(2), 186-193.—Assessed the relationship between power and the sources of power in a channel of distribution that has a well-defined power source: the franchisor-franchisee channel. The consequences of franchisors using coercive vs noncoercive sources of power also were evaluated. Power was defined as the ability of the franchisor (perceived by the franchisee) to control the decision variables of the franchisee. 815 fast-food franchisees completed empirical measures of power, coercive sources (e.g., control of building and land and threat to revoke franchise), noncoercive sources (e.g., the degree and type of

assistance offered by the franchisor), and franchisee satisfaction with the relationship. Results show that (a) there is a significant relationship between the power of a channel member and the sources of power available to him—franchisors relied primarily on coercive sources of power to achieve power over franchisees, and (b) the results of exercising power depend on the sources of power used—franchisee satisfaction increased with the use of noncoercive sources of power. (19 ref)—*L. Gorsev.*

4242. **Jurkovich, Ray.** (Sociologisch Inst, Leiden, Holland) **A core typology of organizational environments.** *Administrative Science Quarterly*, 1974(Sep), Vol 19(3), 380-394.—Presents a core typology of organizational environments consisting of 64 types which can be expanded depending on the user's interest and problems. Different types of environments have consequences for the planning of strategies, operations, and tactics; coalition behavior; and decision making. 4 hypotheses are used to describe organizational reactions to 4 entirely different environmental situations (complexity, routineness of a problem-opportunity state, presence of organized sectors, and the relation of these sectors to the organization). Some of the concepts have been drawn from frequently cited works and from the author's analysis of case studies and management journals. These together with concepts from systems theory are defined and discussed. (30 ref)—*Journal abstract.*

4243. **Lynch, Beverly P.** **An empirical assessment of Perrow's technology construct.** *Administrative Science Quarterly*, 1974(Sep), Vol 19(3), 338-356.—Describes a comparative measure of technology based on C. Perrow's 1967 theory that the technology of an organization is a major determinant of its structure and other characteristics. A 7-item scale that provides a reliable and valid measure of the technology construct, which discriminated among the technologies of 15 functional departments in 3 academic libraries, is also described. (35 ref)

4244. **Paulson, Steven K.** (Virginia Polytechnic Inst & State U) **Causal analysis of interorganizational relations: An axiomatic theory revised.** *Administrative Science Quarterly*, 1974(Sep), Vol 19(3), 319-337.—Presents an empirical analysis and conceptual extension of M. Aiken and J. Hage's (see PA, Vol 44:5768) study of organizational interdependence and intraorganizational structure which found that organizations with many joint programs tend to be more innovative, complex, and have more decentralized decision-making structures. A causal theory of interorganizational relationships was developed and tested using partial correlational and multivariate path analysis of data from 135 health and welfare organizations. A revised model of 8 independent variables centering around formalization, effectiveness, and innovation is presented which accounts for 1/3 of the variance in interorganizational relations and calls into question several classical assumptions of organizational theory, including those which emphasize that formalization and centralization are responsible for efficient and effective bureaucracies; the present data suggest that formalization and decentralization are responsible for an effective but not necessarily efficient bureaucracy. (100 ref)—*L. Gorsev.*

4245. **Rotondi, Thomas.** (Marquette U) **The innovator and the ritualist: A study in conflict.** *Personnel Journal*, 1974(Jun), Vol 53(6), 439-444.—Describes and analyzes a hypothetical organizational incident, discussing several aspects associated with innovator-ritualist conflict. It is concluded that such conflict is related to the presence of internal competition and deficiencies in individual need fulfillment.

4246. **White, Paul E.** (Johns Hopkins U) **Resources as determinants of organizational behavior.** *Administrative Science Quarterly*, 1974(Sep), Vol 19(3), 366-379.—Attempts to explain organizational behavior (e.g., consensus, apparent organizational purposiveness, and cohesion) in terms of individual goals and constraints imposed by source utilization. A model of the relationship between resource availability, collective solution-making, and group cohesion is presented which is based on J. S. Coleman's theory of collective decisions (see PA, Vol 40:8737). The advantages of this model, which is not restricted to definitions of psychological conditions among members of the organization (e.g., common values or goals), are also discussed. It is suggested that defining the environment in terms of existing control over resources and of the decision maker's accessibility to these resources specifies the conditions that produce alternatives for the decision maker. (38 ref)—*L. Gorsev.*

#### Human Factors Engineering & Safety

4247. **Fogel, Lawrence J.; England, Carl E.; Mout, Michael L. & Hertz, Thomas D.** (Decision Science, San Diego, CA) **Principles of display and control design for strike RPVs: Final report.** San Diego, CA: Decision Science, 1974. x, 145 p.—In a series of 4 experiments it was determined that (a) the outside-in mode of attitude display was preferred in spite of the pilot's experience and training with the conventional inside-out display, (b) the position-mode control stick was superior to the conventional-rate control stick, and (c) sensor mounting resulted in different levels of performance with the heads-up attitude displays. (25 ref)

4248. **Kraft, Conrad L. & Anderson, Charles D.** (Boeing Aerospace Co, Seattle, WA) **Development of criteria for printing color reconnaissance stereo strip photography for interpretation under dynamic viewing conditions.** *USAF AMRL Technical Report*, 1973(Dec). No 73-104, 76 p.—Screened 63 Os for their visual acuity, stereopsis, and phorias and measured their target acquisition performance after brief training. The effects of camera convergence angle and film contrast were investigated. Analyses were completed on all targets and for those targets where target size and contrast did not preclude acquisition performance. A quantitative test for chromostereopsis was developed and given to all Os, and stereoscopic skill was measured with achromatic and chromatic transparencies of the Critical Limen Stereo Test. Stereoscopic skill was better with the achromatic tests than with the chromatic, and the difference was only partly predicted by chromostereopsis. Target acquisition performance with the chromatic imagery was not significantly altered by the main effects of camera convergence angle nor film contrast introduced in printing. For the targets wherein target size and/or target contrast did not result in extremely high or low

performance, camera convergence angle had a significant effect. (30 ref)—*Journal abstract*.

4249. Wedell, Jacelyn & Alden, David G. (U Oregon) **Color versus numeric coding in a keeping-track task: Performance under varying load conditions.** *Journal of Applied Psychology*, 1973(Apr), Vol 57(2), 154-159.—Investigated the effectiveness of a color vs a numeric code in a modified keeping-track task—air traffic control. Altitude state was the coded variable. Ss were 36 male undergraduates. It was hypothesized that (a) color coding would be superior to numeric coding, particularly with a greater number of total items displayed; and (b) color would be relatively more efficacious with a greater number of items in the interrogated state. Neither of these hypotheses were supported. Based on an error-type analysis, it is concluded that color can aid in retaining information concerning category size and item spatial

location; identity information was quickly lost.—*Journal abstract*.

4250. Williams, Allan R.; Siegel, Arthur I. & Burkett, James R. (Applied Psychological Services, Wayne, PA) **Readability of textual materials: A survey of the literature.** *US AFHRL Technical Report*, 1974(Jul), No 74-29, 70 p.—Presents a review of the literature relating to methods of measuring the readability/comprehensibility of textual materials. Various formulas for calculating readability are presented and placed in historical perspective, and the general status of research into the development of readability indices is discussed. An experimental evaluation of modified training materials presented with and without auditory supplementation is also outlined, and steps in the preparation of a training materials modification handbook are described. (8 p ref)—*Journal abstract*.

# BRIEF SUBJECT INDEX

Entries in the Brief Subject Index are derived from a 4,000-term *Thesaurus of Psychological Terms*. Only those terms representing subject matter content covered in this monthly issue are listed. A thesaurus term missing from the listing indicates that no material of major relevance to the concept is included in the issue. Records are indexed at the level of specificity contained in each document. Each index entry also refers the reader to broader generic concepts as well as to more specific concepts related to each term. Thus, a reader interested in articles concerning childhood psychosis may find additional relevant information under "psychosis" or "early infantile autism."
